The Arizona & New Mexico Railroad, whose line extends from Lordsburg, N. M., to Clifton, Ariz., a distance of 71 miles, is being widened to standard gauge, and in the mountainous section is being straightened by several tunnels and open cuts. For a distance of about 50 miles this line stretches along the Gila valley, leaving it at Coronado, a point about 15 miles southeast of Clifton. Near Coronado the San Francisco river flows into the Gila; a few miles farther west Eagle river empties into the Gila. Clifton is situated on the San Francisco, which flows a good volume of water most of the year. Eagle river furnishes the water supply for Morenci, the latter town being about half way between the San Francisco and the Eagle, 6 miles west of Clifton and 2500 feet higher in altitude. There is a pumping plant on the Eagle, which forces water through 6 miles of pipe to Morenci, raising it 1500 feet in that distance. A water tunnel is being cut to the Eagle river so as to get a 90-foot fall. Here water wheels will be put in to operate pumps and electric generators.

Between the Eagle on the west and the San Francisco on the east is the well-explored mineral belt of the Clifton-Morenci district, which is approximately 10 miles north and south by 5 miles east and west. On the west this belt is bounded by granite, it being noted that a well defined north-south shoot of ore is next to a granite foot wall. The country rocks that bound the belt on the east are syenite, lime and quartzite. The mineral belt itself is largely porphyritic in character, there being a great dike of that material trending north and south through the district, but the formation has been much broken and displaced near the surface. The ores, which occur in great masses in some localities and in extensive shoots in others, are sulphides and carbonates. The workings on the various groups get into the sulphides at from 300 to 350 feet depth, though one group they were not struck till the depth of 500 feet was reached. The major part of development and production has been confined to the central zone of the great belt, extending from a point south of Morenci to a point north of Metcalf.

As is generally known, the great operators of the district thus far have been the Arizona Copper Co., with offices, smelters and concentrators at Clifton, and the Detroit Copper Co., whose offices, smelter and concentrating plant are at Morenci. Near the latter place the mineral holdings of the two companies adjoin and interlock, their underground workings coming together at various points.

At Clifton is the outlet of Chase creek into the Frisco river. That creek marks the course of a great erosion which cuts through the mineral belt from northwest to southeast. On both sides of the creek are exposed the ledges of oxidized ores and shoots of green copper carbonates, showing more ore in sight than miners are accustomed to seeing. The Arizona Copper Co. operate a 30-inch gauge railroad in this gulch from Clifton to Metcalf, a distance of 9 miles, by which supplies are hauled up to the mines and the ore transported to the smelter and mills at Clifton. At a point 5 miles above Clifton a 2200-foot incline tram car line connects the railroad with the mines of this company near Morenci. The incline stands at an angle of about 26°, the cars being operated by gravity. Near Metcalf the same company operates two other mines—one on each side of Chase gulch—the tunnels and open cuts through which they are worked being several hundred feet above the bottom of the gulch. They are reached by incline tram lines. It is understood that the Arizona Copper Co. controls a large part of the holdings on both sides of Chase gulch from Metcalf down.

The present smelting equipment of the Arizona Copper Co. will soon be supplanted by a new, modern plant. Supt. George Fraser states that the removal of the old plant and the installation of the new one will require only about five weeks' time. The new plant will comprise five 200-ton furnaces, built in sections, 4x21 feet in dimensions, the idea being that any section may be removed and repaired and replaced without long interfering with the work. It will include three stands of converters, each with capacity to turn out thirty-five tons of copper per day. The flue chamber, for arresting the dust from the furnaces, will be 60 feet long, 30 feet wide and 20 feet high, and will have an outlet through 480 feet of incline tunnel and a 280-foot stack. The ore bins are being rebuilt, with capacity for storage of one month's supply of coke. Besides the large concentrating plant adjacent to the smelter, a 300-ton concentrator is being erected at their mines near the head of the main incline. The slag from the new smelter, instead of being handled by slag cars, as now, will be carried away through a flume of water.

The Detroit Copper Co., the principal stockholders in which are the same as those who control the Copper Queen at Bisbee, operate a large smelter, with converters, and a 500-ton concentrator at Morenci. This concern has just completed a 36-inch gauge railroad from Morenci to Guthrie, 18 miles distant, where it connects with the Arizona & New Mexico road. The new line follows down Morenci canyon, making four complete loops over high trestles. The Detroit concentrator, in charge of G. E. Hunt, has crushers,

trommels, thirty-two jigs, two Bryan grinders, two sets high-speed rolls, twenty-eight belt concentrators, five Bartlett tables, numerous hydraulic classifiers and settlers—all operated by three gas engines. From 450 to 500 tons of ore are milled daily. It is delivered to the crushing floor by belt conveyors. The jig product is divided into seven grades, which include over 70% of the mill savings. The table products grade all the way from very coarse and heavy to the lightest slimes. The water used in the mill is economized, and a small saving of values made by a system of classifiers and settlers devised by Supt. Hunt. The system consists of eight redwood tanks, 10 feet diameter and 18 feet deep, each having a tube about 1 foot in diameter that stands in the center of the tank, the lower end being a foot or two above the bottom of the tank. The upper end of this tube, which is even with the top of the tank, receives the tailings from the jigs and tables, discharging same at the bottom of the tank. As the tank is thus kept full of water, the sand and slimes settle at the bottom, the tolerably clear water constantly overflowing at the top is carried to the mill for use again. The slimes from these tanks are concentrated a second time. The mill concentrates for February, 1901, produced 288 tons of copper, the ores having run about 4.20% copper. The ores concentrated are largely sulphides, very siliceous and carry some aluminum. Considerable amount of copper is also saved by precipitating that in solution by scrap iron.

The Shannon group of about sixty claims belongs to the Shannon Copper Co., composed largely of New York, Connecticut, Montana and Arizona people, P. Wiseman being manager. Their group covers the principal portion of Black mountain, near Metcalf. This mountain stands between Chase and King gulches and is covered by a capping of iron hematite, with shoots of copper carbonates, below which appear to be three parallel ledges, trending north and south, and separated by parallel bodies of porphyry. These three ledges—described as the east, west and center—range from 50 to 100 feet wide, carrying copper sulphides and carbonates, with considerable black oxides. The carbonates here are not much decomposed, as in many places, but are firm and hard. At various depths there are found masses of cuprite and occasionally copper glance. Much of the ore here appears to be unusually high grade. The property has a large amount of development, consisting of a number of tunnels which cut through the mountain; some of them are crosscuts and others follow the trend of the ore bodies. The lowest tunnel cuts through the mountain 350 feet below the surface, all the tunnels being connected by winzes and upraises. At the surface there is much open-cut work. In many places the ore quarried out runs 45% iron and 6% to 10% copper. A shipment of 1000 tons from an open cut ran 10% to 15% copper. The porphyry horses, which separate the main ledges, carry some copper. This company recently bonded an adjoining group of eleven claims, for which it is said they will pay \$750,000 to the A. C. Co. The Shannon people have commenced the erection of a 300-ton smelter at a point a few miles north of Clifton and are building a railroad spur to it.

The purchase of about eighty copper claims near Clifton by the General Electric Co. was noted in this paper in a recent issue. It may be further stated that the territory purchased lies in the vicinity of Metcalf, along through the northern section of the known copper district. It is reasonably assumed that this important purchase will be followed by development, equipment and production.

A considerable amount of other development is in progress in the district, much of it of an important character. Among the interests included may be mentioned the Copper King, Sterling, Homestake, Medlar and Standard. In the Greenlee district, 8 to 10 miles north of Clifton, is a different formation, bearing gold quartz. Parties headed by Col. Dunham have bonded a group in that section and are preparing for development.

Such men as Prof. Wm. Church, W. A. Farish, John Langton, Prof. Marsh and G. S. Pitcairne were recently in the Clifton-Morenci district reporting on various properties, and this affords some idea of the quiet but systematic attention the district is receiving.

Clifton, March 28.

WASCOTT.

World's Record is Claimed.

Idaho Springs can claim a world's record on tunnel driving. In March, with one shift on the drills, the Newhouse tunnel was driven 255 feet. This is probably the best record ever made in similar rock. Under the present system employed in the Newhouse, the record has been nearly reached several times, but the work accomplished last month easily takes it.

The tunnel is now in over 2 miles and the air is so pure that the light entering the entrance to the tunnel can be seen from the breast, although the aperture looks to be about the size of a nickel from that distance. The enthusiastic mining men challenge the word to equal the record made last month, in which one shift at the drills penetrated 7 feet more than an average of 8 feet per day in drilling a 12x12 bore.—Georgetown, Colo., Courier.

Operative Conditions of Gas Engines.

While the technical side of the gas engine and its defects as a converter of heat into work have been pointed out and its weaknesses as a machine have been made known, there is one particular of great interest, both to user and manufacturer, which is not so much discussed—and that is the man who runs it. There is not a gas engine in use that is not mistakenly blamed at some time for things that belong to the engineer, and yet do not come from him directly.

The knowledge of how to handle steam engines is nearly universal in this country. It is hard to find a community where there is not some one who understands the conditions necessary in order to have a steam engine run; not always under the best conditions for efficiency, perhaps, but still run and do its work. The gas engine, as a machine, is far simpler and easier to manage than a steam engine, including the boiler; but it should be distinctly borne in mind that, while the conditions under which a gas engine will run are simpler, they are also more imperative.

To explain by an illustration: To start a steam engine, the boiler must have its proper supply of water, the fire must be built, steam raised, the engine crank must be put in proper position, the cylinder cocks opened and the steam turned on. The last act does not call for any nicety of manipulation. More or less steam, so that there is enough to start, only means faster or slower motion, and not a failure of the whole attempt. With a gas engine, if it uses a tube ignition, the gas is lighted to heat it, the engine is set in position to draw in its first charge, the valve or valves are opened to admit the charge, the motions necessary to draw in and then to fire the charge are gone through, and the engine starts. To have the engine start, though, requires close attention to some apparently simple things.

The tube must be hot enough. The engine must be set right to have the functions come in their proper order. The right amount of gas and of air must be turned on, and a certain amount of energy must be imparted to the wheels. A failure in any one of these means a failure to start. The third particular is the one that most frequently gives trouble—that is, not getting the gas and air turned on in the proper proportions, and nearly always the gas is in excess. Lack of proper understanding of this one point has given more trouble to gas engine users than all other causes combined, except natural neglect. It cannot be too constantly borne in mind that gas engines, so called, are gas and air engines, and that the air is just as essential to their operation as the gas; and, also, that more gas does not mean more power, but often much less. Air is cheaper than gas, and it pays to use all of it that the gas needs; better have a surplus of air than a surplus of gas—better for the engine and better for the pocketbook. If a man gets the idea firmly fixed in his mind that, to run a gas engine, he must get the charge in, keep it in and explode it, and that the charge must be of a proper proportion, he need have very little trouble, outside of actual breakage, in running an engine.

Some judgment in setting is necessary to get the mixture right, and, if a man does not clearly understand what he is trying, it is not as readily done as if he does. Gas, being always under some pressure, comes in whenever a valve is opened, the air only when there is some diminution of pressure within. The slower an engine is turned the less gas should be turned on, as it has more time to get in and crowd out air. The lighter the atmosphere the less gas should be turned on; and, more important still, is it to remember that if not enough gas is turned on, repeated trying to start tends to correct this, and finally enough will be gotten in; but, if too much is turned on, increasing effort only makes the matter worse, and the engine cannot start until this surplus gas is gotten rid of. This can be easily done by shutting off the gas and turning the engine, as in starting, thus pumping out the surplus gas. Caution should be used, as when enough has been gotten out the charge will explode. When this happens the engine is ready to make a fresh start.

Anyone that can do a little thinking, that can keep his eyes open, and who is careful, can run a gas engine. In the hands of a careless man it is safer to have in a neighborhood than a steam boiler is; but it will refuse to run for trifles that a steam engine would not mind, and, to run its best, it must be humored in its peculiarities.—Condensed from Am. Machinist.

THE New Jersey Appellate Court holds that it must be clearly shown that the value of property proposed to be bought by the directors of a corporation is at least reasonably near the price to be paid, and that the action of the directors is subject to review at the instance of any stockholder who considers himself aggrieved; also that the mere fact that two-thirds of the directors and stockholders voted for the purchase cannot prevent its review.

On the island of Etorpu, which is situated midway between the northern end of Japan and the southern part of Kamtschatka, an extensive sulphur district has been opened up. The island is volcanic, and the deposits occur in circles round extinct and still active volcanoes. The tram plant has a capacity of 3000 tons a day. The beds are being worked by a Japanese syndicate.

The Late Richard P. Rothwell.

Richard P. Rothwell, editor of the Engineering and Mining Journal of New York, died at his home in that city on April 18th. He was the organizer of the American Institute of Mining Engineers at Wilkesbarre, Pa., in 1871, was president of it in 1882, and at various times held other office in it. In 1890 he had charge in the taking of the eleventh United States census of the collection of statistics of gold and silver mining. He was widely known as a successful mining and metallurgical engineer, and had very high rank in technical literature and as a statistician of mines and mining. In the last he has left behind him imperishable work in his annual publications of "Mineral Industry," the statistics of production not alone of the United States but of the world.

Flow of Water in Pipes.

The resistance to the flow of water through pipes may be considered as made up of two parts: (1) A loss of energy resulting from eddies produced in the water by irregularities in the inner surface of the pipe; (2) that due to friction of the water on the inner surface of the pipe.

Until recently the former, though taken account of by experimental coefficients, has been practically neglected as a cause of loss of head. When water flows through a pipe with a rough inner surface, a disturbance is caused in the stream of water, which may extend entirely through the mass, and it is the internal work of friction resulting from these eddies that constitutes by far the larger part of the total energy consumed in the flow. With a very rough inner surface, such as a riveted steel pipe, almost the entire loss of head is chargeable to internal friction due to eddies.

The relative importance of the two factors causing loss of head depends much upon the velocity of flow and diameter of pipe, as well as upon the roughness of the inner surface. For low velocities and small diameters the resistance is largely due to friction on the inner surface of the pipe, and varies closely with the velocity; but at ordinary and high velocities it is largely due to internal friction, and varies nearly with the square of the velocity. These relations, however, are much influenced by the roughness of the inner surface of the pipe.

Owing to the variation in the general law, due to the variation in conditions, as already noted, it is impossible to derive a formula which will apply to all cases. The best that can be done is to select a form of expression which will approximately represent the law for the flow of water through clean wrought-iron and cast-iron pipes, and then to make use of coefficients by which the results of experiments may be conveniently expressed and utilized. The approximate law commonly used is that the loss of head varies as the square of the velocity, with the length of pipe and inversely with the diameter, or,

$$h = f \frac{l}{d} \frac{v^2}{2g},$$

in which v = velocity; h = loss of head; f = friction factor; l = length of pipe; d = diameter; g = acceleration due to gravity.

Tables giving values of (f) in this expression, for smooth cast-iron pipes, may be found in works on hydraulics. In practice, the use of a coefficient (f) is somewhat inconvenient. A simpler and more commonly used form of expression, modified from the above, is the Chezy formula:

$$v = c \sqrt{rs};$$

in which r = hydraulic mean radius; s = hydraulic slope $\frac{h}{l}$; and c = a coefficient.—Clinton B. Stewart in Engineering News.

Refining of Petroleum.

Census Bulletin No. 61, just published, gives for the year 1899 the statistics of the petroleum refining industry. Edw. W. Parker of the United States Geological Survey was the special agent who prepared the report.

From the figures given it appears that the capital (representing physical properties) employed in the industry in sixty-seven establishments was:

In land.....	\$ 8,166,032
Buildings.....	6,502,182
Machinery, tools and implements.....	39,565,389
Live capital.....	41,094,289

Total.....\$95,327,892

The costs of materials used in the manufacture:

Crude petroleum (52,011,005 barrels).....	\$ 80,424,207
Fuel.....	3,120,441
Acids.....	1,735,782
Packages bought, barrels, tin cans and cases.....	2,930,805
Coopers', carpenters' and tinners' materials.....	8,220,928
Mill supplies.....	228,926
All other materials.....	3,300,851
Freight.....	2,897,401

Total.....\$102,859,341

Total wages paid to 12,199 workers.....	6,717,087
Miscellaneous expenses.....	3,330,851

Total all costs.....\$112,907,279

The values of the several products at the refineries were:

Burning oils.....	\$ 82,244,961
Residuum.....	688,455
Paraffine oils.....	3,987,037
Paraffine wax.....	7,791,149
Reduced oils.....	7,108,168
Naphtha and gasoline.....	15,991,742
Neutral filtered oils.....	2,256,626
All other products.....	3,861,246

Total.....\$123,929,384

Of the total quantity of the refined oils produced 40% was exported.

The Mechanic of the Future.

The consensus of opinion among intelligent foreign observers of our industrial situation is that a large proportion of the extraordinary advance in American industrial activity has been due to the character of the worker in our shops and factories. The American mechanic has for a long time stood as a type of what is best in his line, and to-day probably there are no better workers, no more skillful and efficient operatives, in the world than we have at our command in the great shops and industrial enterprises of the United States. These men are the result of a system which unconsciously has produced a type of operative greatly superior to any other that has yet appeared. The system of apprenticeship and direct instruction in the shops, combined with free education and a sufficient wage to enable the laboring man to enjoy the benefits of culture and recreation elsewhere denied him, have worked together to the production of the superior product known as the American mechanic. The question now is, How shall we best educate the rising generation to take the place of those who are our industrial bulwark to-day?

The apprentice system is practically dead, and so far nothing seems to have appeared that can fully take its place. Schools of technology are giving the young men graduating from them a certain foundation of knowledge which may be in the future beneficial to them. But the requirements of our shops are not to be satisfied by the graduates of schools of handicraft and technology. What the shop wants is experienced men, and the main question is, Where can the man get the experience before he comes to the shop to sell it?

One thing is very certain, and that is that he can not get the experience that is necessary to him in the school. With the proper opportunity to put into practice his knowledge after leaving school, he will become in a few years a mechanic of the very best and highest type; but without this opportunity—and too often poverty prevents the seizing it—he is of little value when he first comes seeking employment. It would be a crime were the American mechanic to be allowed to become extinct. Yet to the studious observer it is evident that nothing short of extinction menaces him in the industrial situation as we see it to-day. This unfortunate condition is by no means the result of any premeditated plan, but is the outgrowth of conditions which have been brought about in the effort to better the condition of working men by both men and employers. In opposing the policy of employing apprentices the labor unions have not looked far into the future, but have struck a mortal blow at the industries upon which the descendants of the members must live.

No doubt by this time the error of this point of view has become widely recognized, and it is likely that if manufacturers should take some definite step toward introducing the apprentice system largely

again, and providing in some way for the instruction both in handicrafts and in the studies pursued generally in schools of a sufficient number of boys and young men, the result would be admirable, and the fine race of mechanics that has distinguished this country would flourish rather than fall into the decline preceding extinction. We have only to look across the Atlantic at England to see the condition here referred to in a little further stage of development. The picture is by no means a pleasing one, and it seems time for the manufacturers in this country to act in order that their future salvation may be secured.—Condensed from Electric Review.

The Durkee Drill.

The air drill in general use in mines, while a very satisfactory machine as regards the work which it does, is sometimes of low efficiency, some claiming that not more than one-tenth of the power of the steam in the cylinder of the compressor is delivered upon the rock at the bottom of the drill hole. This is not always chargeable to the air drill in itself, but sometimes to the entire group of machinery through which the air drill is driven. As an instance, the air-compressing cylinders are water jacketed to carry away the heat of compression of the air, which heat is essential when the air is expanded if the air is to develop a fair proportion of the power expended in its compression. This is but one of the unavoidable losses due to the system of rock drilling by compressed air.

The air drill has been in use so long a time that the mechanical defects are in the main eliminated. The accessories have also undergone as rapid improvements as to the air drill proper.

On account of the low efficiency of the air drill and its consequent high cost of installation and of fuel for operation, considerable study is given the subject of more economical rock drilling. One of the results of this study is the Durkee lightning drill, recently placed on the market by the Mine & Smelter Supply Co. of Denver, Colo. The Durkee drill, as herewith illustrated, is operated by a small electric motor through a flexible shaft, and, the manufacturers say, uses but 1½ H. P. at the motor to work a 2½-inch air drill, the idea being to follow as far as possible the best practice as established by the air drill, using the same style of column, arm, clamp, guide shell and feeding device, chuck and rotating devices. The method of application of the power to the bit is, of necessity, entirely different from the air drill. The rotary motion of the motor is transmitted through a flexible shaft to a crank shaft in the drill, which oscillates a heavy bell crank in such a manner that the piston rod carrying the bit is given a quick motion toward the rock, while the return stroke is much slower and of increased power. This is designed to give a sharp blow to the rock and a strong pull to

The Durkee Drill.

release the drill from a rifled hole. The power is delivered to the piston rod through buffer springs which springs, however, are not required to deliver the blow by their expansion. Attention has been paid to simplicity and ease of repair; any part can be taken out and replaced without removing the drill from the column.

The Mine & Smelter Supply Co., who are agents for the Durkee drill, have tested it in actual mine work and assert that the results are entirely satisfactory. They say that the drills are now running in mines in Colorado, Utah, Arizona, Idaho and other States, and in all cases the reports are most favorable.

Mining and Metallurgical Patents.

Patents Issued April 9, 1901.

Means for Raising Water.—No. 671,600; J. Kurtz, Denver, Colo.

Chamber having a valve-controlled inlet opening in lower portion, a discharge conduit 9, whose lower extremity is open and located in lower part of chamber, a second chamber having a valve-controlled opening with which the upper extremity of conduit communicates, one or more discharge pipes leading upward from second chamber, a cylinder divided into two compartments, a piston stem arranged to slide in chamber, a weight attached to stem above cylinder, two pistons attached to stem and located in respective cylinder compartments; a conduit connecting two compartments and having valve-controlled air inlet, a pipe leading from upper part of conduit 9 to upper compartment of cylinder, below piston therein, a check valve located in said pipe and arranged to allow air to pass from conduit to cylinder compartment, another pipe connecting upper part of first-named chamber with the other cylinder compartment above its piston, a check valve located therein to allow the air to pass from cylinder compartment to chamber, an atomizing apparatus connected with an explosive liquid source, a pipe leading from bottom of lowermost cylinder compartment to the atomizing apparatus, which is also connected with first-named chamber, and means for igniting explosive substance within chamber.

Process of Treating Ores Containing Silver, or Silver and Gold.—No. 671,704; E. D. Kendall, Brooklyn, N. Y.

Process of treating ores or other bodies for extraction of precious metals, which consists in treating them with a suitable chemical solution containing a thiocyanate and a cyanide capable of dissolving silver or silver and gold, and in then treating the so dissolved silver by a suitable sulphide, such as potassium sulphide, and in so regulating the amount of sulphide to silver as that they shall substantially equalize each other, in separating the sulphur sulphide, and in returning thiocyanate and cyanide into subsequent operations for further treatment of the ore.

Mining Machine.—No. 671,818; C. E. Davis, Chicago, Ill.

A stationary frame upon which operating mechanism is supported, and having at rear end one or more downwardly projecting shoes or supports, a roller associated with each of said shoes or supports and mounted on frame, said roller or rollers adapted to engage a supporting piece placed beneath shoe, so as to allow machine to be moved laterally, a holding-jack connected with rod passing through enlarged opening or openings in frame, rod so positioned as to be opposed to roller or rollers, the openings through which rod passes of such size that rod engages roller or rollers when jack is in its operative position and locks roller or rollers from rotation.

Turbine.—No. 671,885; A. Hendry, Fayetteville, Ark.

A series or plurality of wheels whose buckets have a general outward inclination or curvature with inner and outer walls parallel to each other, and side walls having transverse spirality or curvature, and diverging outward, a series of steam chambers and exhaust steam chambers, with suitable outlets, and steam chutes receiving steam from one steam chamber and delivering it to one wheel, second wheel receiving steam discharged from latter wheel and discharging it into an exhaust steam chamber.

Ore Separator.—No. 671,573; F. H. A. Wielgaski, Christiania, Norway.

In a centrifugal machine, means for feeding a washing fluid from center, a chamber provided with reverse branch passages, a passage conducting liquid into one reverse passage in a direction opposite to flow of washing fluid therein and means for feeding material to be separated.

Driving Device for Pumps.—No. 671,468; C. H. Clayton, Limestone, N. Y.

A pumping and lifting machine comprising a reciprocally movable pump rod, a walking beam having one end connected to rod and other end weighted, a turntable provided with a series of cam faces arranged one in advance of the other and a non-revolvable rock arm pivotally supported at one end and having its other end supported by the cam faces and connected to the weighted end of the walking beam for transmitting motion thereto.

Assay Furnace.—No. 671,558; D. Laird, Forfar, Scotland.

In combination of a central chamber, flame-directing ribs projecting from hearth, flame passages leading into chamber tangentially, a vapor burner at end of passages, a pipe feeding air to burner, having a coil intermediate of its ends, a supplemental chamber inclosing pipe, a core in chamber having conical top, lid for closing main chamber and a pipe having its inlet in upper part of main chamber, pipe discharging above apex of top of core.

Method of Making Cyanides.—No. 671,479; J. Grossmann, Manchester, England.

The process for the manufacture of ferro-cyanides consisting in passing ammonia gas over a mixture of carbonaceous matter and a sulphide of an alkali at a temperature of from 700° to 800° C., and adding to products of reaction suitable iron compounds for converting the cyanides first formed into ferro-cyanides.

The New East River Bridge.

The contract for the new East river bridge at New York was awarded to the John A. Roebling's Sons Co. several months ago, and the preparation of plans and other work has since then been under the supervision of Charles G. Roebling, the president, who is assisted by William Hildenbrand.

On April 7th the first public step of importance in the construction was taken. The work done then was the placing in position of the 24" diameter ropes which support the temporary foot bridges on which the workmen will stand during the main work of cable laying. Several methods of getting the first line across have been employed in the past, and kites, swimmers and other means have been tried, but the method employed on this occasion is a distinct advance over all previous ones. One shore end having been made fast, the drum containing the cable was carried across the river on a float and the cable payed out, allowing it to rest on the river bed until it could be conveniently raised from the water and to the desired height by means of a stationary engine and drum. This was done successfully on April 11th, the time required being only seven minutes, navigation being suspended during that period.

The utilization of peat on an enormous scale is proposed in north Germany, where it is said a quantity of peat equivalent to 300,000,000 tons of coal is available. The plan is to use the peat as fuel at the place where it is found for conversion into electric power, which would be distributed to manufacturing centers.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Judge Brown has ordered the removal of the office of Recorder from Wrangel to Ketchikan, the latter place being much the more important commercially and the center of a rapidly developing mining district.

From Nome comes the report that gravel taken out from beneath the ice is yielding 30 cents to the pan.

A placer strike on the upper Pelly river is reported from Selkirk.

Finney & Wiley, at Porcupine, are putting in hydraulic machinery.—Dewechter & Gasman are installing a hydraulic plant.—On discovery, owned by Jack Dalton, considerable development is projected. A plant costing \$6000 has been set up and is ready for operation.

ARIZONA.

COCHISE COUNTY.

E. B. Gage, a large owner of Tombstone mines, says he has succeeded in getting all the Tombstone companies to unwater and reopen their mines, after working a year on the project together with Frank M. Murphy, president of the Santa Fe, Prescott & Phoenix Railroad.

The Easter Sunday M. Co. have bonded mines near Bisbee for one year to A. M. Tong and associates at \$250,000. Men will be put to work on it at once.

GILA COUNTY.

A 19-foot ledge of ore is reported found in the Star Light mine, near San Carlos. Thirty men are employed and considerable ore shipped. The owners, it is said, will erect smelting works at the mines. Contracts have been let for running 150 feet of tunnel; W. J. Nicholson is Supt.

The last Congress segregated a small tract of land, the site of an old mine, from the San Carlos Indian reservation. A shipment of ore made from claims on the tract is said to have returned \$85 a ton.

MARICOPA COUNTY.

Moore & Koon's claims have been bonded for \$5000 by J. K. Truman, who has begun work on the property. It is understood that a 10-stamp mill will be built.

PINAL COUNTY.

A custom reduction works for Red Rock is said to be under favorable consideration.

YAVAPAI COUNTY.

A power plant is projected on Fossil creek, to be used by mines of Jerome, Prescott and Phoenix. The creek fall is represented to be 1500 feet in 12 miles and the electric power will have to be transmitted 40 miles to Jerome, 50 miles to Phoenix and 70 miles to Prescott.

CALIFORNIA.

ALAMEDA COUNTY.

The Sunset G. Dredging Co. has incorporated, with W. H. Weibbe, Adolph Uhl, C. J. Schuler and L. Golly of Oakland and A. W. Bell of San Francisco as directors.

AMADOR COUNTY.

The Lincoln Co. have had their bond extended until 1906. They have considered that greater depth was necessary for proper development of the mine. On the 1200 level no showing of particular value appears. The shaft is being repaired and it is intended to go down 600 or 800 feet deeper.

The strike in the 2300 level of the Kennedy mine, Sutter Creek, is proving more extensive as developed. An 80-foot ledge, all good milling ore, is said to be uncovered. Some very rich ore is found in the hanging wall. On the incline the depth of this find is 2700 feet.

Sixty stamps are crushing ore taken from the 2000-foot up to the 1700-foot levels at the Oneda mine, Sutter Creek.

The Bunker Hill shaft, at Amador City, is cleaned out and repaired and sinking has commenced from the 800 level; C. R. Downs is Supt.

On the Shenandoah mine, near Plymouth, Supt. Thornton says he will sink a three-compartment main working shaft for the mine. He estimates a loss of \$7 to the ton on rock so far milled and is undecided whether to try the cyanide process or not. He claims between 20,000 and 30,000 tons of ore blocked out in the mine.

The Centennial Co. at Drytown has decided to put in new and heavier machinery during the summer.

EL DORADO COUNTY.

At the Mt. Pleasant mine, at Grizzly Flat, a 4-foot ledge has been found at a depth of 47 feet and specimen gold quartz in the 850 level of the reopened old workings.

W. & C. Toombs, at White Rock, have struck the old channel in a tunnel.

KERN COUNTY.

New concentrators are to be added to the Garlock mill.

Sampling works at Randsburg are now completed.

The Santa Fe Reduction Co., at Ludlow, will move twenty stamps from the Barstow mill to that place, if prospecting develops water to run them.

Goldsmith & Robb are operating the Winnie mine. They intend sinking from 170-foot level to 300-foot level. A crushing of eight tons returned \$40 per ton.

MADERA COUNTY.

A hoist and pumping plant for the Common Gold mine, near Coarse Gold, have been recently constructed; A. H. G. Palmer is Supt.

The Waterloo development work consists of a 200-foot and 300-foot shafts, the plant of two 85 H. P. boilers, two hoists, mill of ten 1000-pound stamps, two concentrators and a giant duplex compressor, which pumps and ventilates the mine. The company is spending about \$4000 per month.

NEVADA COUNTY.

The Mountaineer M. & M. Co. have leased to J. J. Sloat of Hamilton, Ohio, the Mountaineer mine, at Grass Valley, for two years, with purchase option at \$50,000. The lessee is to spend \$15,000 in development work; W. A. Dennis is Supt.

At the Allison Ranch mine the ledge is being prospected on several levels and sinking from the 1300-foot station is to be resumed. The company propose to replace their direct water power plant with electric power, and may substitute an electric hoist for the steam now used.

The Central M. Co., Grass Valley, at the annual meeting elected C. E. Clinch president and treasurer and J. M. Wiley secretary.

Four Grass Valley mines have been bonded by representatives of Senator W. A. Clark of Montana. The claims bonded are the Vulcan, Irish-American, Ford & Smith and Bob Smith, lying between Massachusetts Hill and the North Star mine. A plant of electrical machinery will be put in and a new shaft 500 feet deep will be sunk.

The Penn Con. M. Co. is suing the Grass Valley Ex. Co. for \$600,000 damages for ore taken from ledges claimed to be the property of the Penn Co. at Grass Valley, but which has been mined in by the Grass Valley Co. for the last two years. It is a question of the determination of the situs of the apex of the lode. The case is now on trial in the U. S. Circuit Court at San Francisco.

The Sierra Electric Co. has incorporated, to manufacture and sell electric power in Nevada City; the plant will be at the Plumbago mine, Sierra county; the directors are F. Searles, R. C. Walrath, W. W. Waggoner, H. B. Budd and M. W. Mather of Nevada City.

A ledge 2 feet wide of ore estimated to go \$75 a ton has been discovered in the Lecompton mine at Nevada City. A new double-compartment shaft is being sunk and the new stamp mill is about completed.

PLUMAS COUNTY.

The Club and Star quartz claims at Quincy have been bought by Eastern parties, through their agent, Mr. Lamoureux of Oakland. The purchasers are said to intend to erect a small mill.

It is reported that J. D. Williams & Co. will build a smelter in Genesee valley.

SHASTA COUNTY.

W. Peterson is hydraulic mining on Dry creek, near Igo, working in a 10-foot bank of gravel.

Capt. J. R. De Lamar has bonded the Michigan group of seven partially developed copper claims, adjoining the Bully Hill claims, it is said, for a short term and at about \$50,000. The Michigan vein is believed to dip into the Bully Hill ground, and by the extension of the Bully Hill tunnels 400 feet it would be cut 800 feet deep.

A. J. Wright, superintendent of the Josephine mine, near Redding, reports that the shaft is now down over 100 feet.

B. H. Wilsee and T. G. Harrison have a working bond at \$6000 on the Golden Star quartz mine, near Buckeye.

It is said that a new process of roasting the copper ores at Keswick was to be employed, by which the sulphur fumes would be done away with.

F. Stabel and H. W. Weldon have bonded a group of copper claims in the Backbone district from J. Gesford.

SIERRA COUNTY.

At the Oriental, near Alleghany, the owners propose tunneling to tap the ledge and reopen the old shaft. H. S. Johnston is Supt.

SISKIYOU COUNTY.

The O. & C. shaft in bottom of lower tunnel is being sunk 100 feet deeper and on high-grade ore; G. B. Goodell is Supt.

In the Hungry Creek district, the Sterling and Blue Jay quartz mines have

started with full crews. A new tramway is being put in on the Blue Jay and the Sterling mill is being overhauled; C. R. Wiegell is Supt.

H. Espee, who has commenced hydraulicking on Beaver creek, says he has a big supply of water this year and expects a good clean-up.

The Jillion & La Flesh mills, at Henley, are running steadily.

Hornbrook, April 15.

Saderfield & Tracy of Cecilville are said to have bonded a copper ledge on the South Fork of the Salmon to San Francisco people for \$6000.

J. O. Welsh of Mott says a trial run of the 5-stamp mill on his mine on French creek was successful. He intends adding concentrators and more stamps.

TRINITY COUNTY.

W. W. Ellis recently bought the Kise place, near Lewiston, and is installing a mill on it to crush cemented gold-bearing gravel.

J. B. Layman & Sons, Hay Fork, milled twenty-seven tons of ore from their mine with satisfactory results.—M. B. Parlin is working the Drinkwater placer mine.—J. Jackson is working a 12-foot ledge of copper ore on Carrier Gulch.

The Trinity G. P. M. Syndicate, Ltd., W. Maitland manager, working the Nash mine, is preparing to work a second channel. At present sluicing is employed, but hydraulicking is to be substituted.

The Trinity Copper Co. have contracted for the construction of 5 miles of wagon road from Kennett west to the Shasta King mine. F. Lawry of Sacramento has the contract. The company is said to intend putting in a 250-ton smelter at the mine.

The Sweepstake mine at Weaverville, F. Hall manager, has been connected with Weaverville by telephone. The five months' development work to date is said to open up a large body of gravel, all carrying pay. The tunnels have not bottomed the channel, and it is expected another will have to be run lower. So far as developed, the gravel is over 1000 feet wide and over 500 feet deep. The company will build a ditch from Canyon creek to get a water supply for hydraulicking.

Mining land on East Fork of the Trinity river, from Van Matre's ranch to the Unity Co.'s ground, has been bonded for dredging.

TUOLUMNE COUNTY.

The Sunset mine, on Knight's creek, is bonded to Howe & Harmon at \$4500, \$1000 paid down and balance to be paid within six months. When bonded the original locator had performed only ten days' work in an open cut. Since then the borders have commenced sinking and at 12 feet are said to have ore assaying \$40 to the ton.

The Phillips group, between Turnback creek and Tuolumne river, are being developed in tunnel No. 2, now in 200 feet. A company is now forming which proposes to buy the mine and put in a 300 H. P. turbine on the Tuolumne river.

The Snell group is bonded to an English syndicate at \$38,000. The claims are 15 miles northeast of Columbia, in American Camp district.

The Harvard Co., at Columbia, has put men in the stope and is unwatering the mine. The mill is to start with twenty stamps.

COLORADO.

ARAPAHOE COUNTY.

Mine owners largely interested in Leadville and Cripple Creek mines are said to be organizing to build a large smelter at Denver, so as to be independent of the American S. & R. Co.

BOULDER COUNTY.

The Ramona M. Co., owning the Rough Rider and Little Giant lodes at Wall Street, have commenced a shaft, to go down 200 feet.

CHAFFEE COUNTY.

A new district is reported opening up at Turret, on the west end of Whitehorn district, near Salida. The strike was made on the 400-foot level of the Vivandiere, and the vein is said to be 11 feet wide, with an 8-inch streak running \$1 to the pound. The ore is similar to that of the Little Johnnie at Leadville, and the formation between lime and quartzite is similar. It is reported that in the sulphides there are 3 feet of ore running \$100 to the ton.

CLEAR CREEK COUNTY.

A tunnel on the Mammoth, J. M. McMichael manager, is said to have opened up a rich ore body.

DOLORES COUNTY.

Dr. Campbell, who has a bond on the Atlantic Cable group, at Rico, is operating a small mill on the ore and says it makes a satisfactory separation of the zinc from the iron and lead, the zinc produced carrying 50% to 60% zinc. This re-

sult is obtained by magnetic separators and tables.

Rico, April 12.

FREMONT COUNTY.

E. F. Gropello, chemist in charge of the Dorcas mill at Florence, reports the cyanide department of that mill in good working order, and that the pneumatic cyanide process, which has been adopted there, is proving satisfactory and effective. He reports the tailings as running an average of 60 cents per ton and says some runs have been as low as 20 cents.

Florence, April 9.

GILPIN COUNTY.

The Ophir-Burroughs pool are sinking a shaft at Central City and employing about forty men, including tributers. A. Waters is Supt.

GUNNISON COUNTY.

The California-Colorado M., M. & S. Co. is operating the Ruby Chief, at Irwin; W. A. Welsh, Supt.

JEFFERSON COUNTY.

The smelter now building at Golden is to be, when completed as planned, the largest in Colorado, capacity 1200 to 1500 tons of ore each twenty-four hours. The capacity at the start will be 300 tons, with one furnace of the four projected. May 1 the smelter is expected to blow in. Over 5000 tons of ore are now in the yard. The Clear Creek M. & R. Co., R. F. Carpenter manager, owning the smelter, has contracted for 500 acres of mineral land in Clear Creek district and projects a 5000-foot tunnel and a 2700-foot shaft, the first improvements to be made.

LAKE COUNTY.

President J. A. Heimbaugh of the Fanny Rawlins, Leadville, reports that in the South Winnie shaft there is 6 feet of ore, averaging \$50 a ton, and 3 feet averaging \$25 a ton, with no walls in sight.—A furnace is to be added to the Boston G. S. Co. plant, Leadville. It will be a reverberatory of fifty-ton capacity.—The Ella Beeler and Clear Grit have started up. Four men are getting the workings in shape and extensive developments are planned.

The Reno M. Co., at Leadville, H. Collings manager, is putting in station and sinking pumps. The shaft is now 350 feet deep and some sulphide contact is showing in the bottom. From the First National, adjoining the Reno, regular shipments of good grade sulphide are made and the ore shoot in that mine is believed to extend into the Reno.

Manager J. A. Shinn of the Naylor M. Co., Leadville, reports that the shaft on the White Cap claim is down 600 feet, the last 200 feet being in blue limestone. Some 300 tons of \$10 ore is shipped monthly. This output pays about half operating expenses, and much of it comes from filling of old stopes too low grade to pay in early day mining.

MINERAL COUNTY.

The American Sulphur & M. Co. has incorporated with capital stock \$18,000, to operate sulphur beds on Trout creek, near Creede. The sulphur beds have been known for a long time. Mr. Barrie and H. G. Pierce, of New York, have organized the company as a preliminary step, and in the event that the purchase of the deposit is concluded it will establish works for the treatment and refining of the sulphur and for the manufacture of sulphuric acid.

OURAY COUNTY.

It is reported that the Camp Bird mine is under bond again to same people as before and at the same price.

SAGUACHE COUNTY.

The Banner tunnel, near Crestone, driven on the vein, is now showing the latter to be 5 feet between walls, with 18 inches to 2 feet of pay ore, a honeycombed quartz carrying gold and some copper.

SAN JUAN COUNTY.

The Aztec G. M. & M. Co. has bought a large group of claims in the Needle Mountain district, Silverton; J. Moore, manager.—Near the Aztec Co., E. Liston is working eight claims, which have produced five cars of ore that returned from \$300 to \$400 per ton.—J. H. Sloan has leased the Missouri claim in Boulder gulch.—Manager W. A. Ptolemy of the San Juan M. & D. Co. is operating on Hazelton mountain. The Blackberry vein, lately cut 670 feet in the tunnel, has opened up into ore varying from 18 to 24 inches in width.

SAN MIGUEL COUNTY.

The Alta Mines Co. have incorporated; capital stock, \$2,500,000; directors, W. J. Leudke, D. M. Sneddon and A. Thierbach. The incorporation is to operate the Alta mine at Telluride.

The Keystone placer, at Telluride, is being prepared for the summer's work, sixty to eighty men being employed in building the flume, installing machinery and generally cleaning up.

The Alta mine, in Alta basin, near Tel-

luride, is shipping to the smelters four cars of ore per month that runs \$700 to \$800 per ton in gold, silver and lead. The mill ore is being kept on the dump. The work here shows an ore shoot 1200 feet long.

The Japan Mines Co., tunneling to cross-cut the three veins opened in the upper workings, are in 250 feet and expect to cut the ore bodies at 2700 feet—750 feet lower than the old tunnel. The ore shoots here are opened 2000 feet in length. The Japan mill, shut down during the winter, will now be started.

The Contention group, up Bear creek, has been sold by Scott, Haskins, Hockley and others to the Smuggler-Union Co. at a figure from \$100,000 to \$150,000. The new owners are expected to build a tramway to the Smuggler-Union mills at Pandora, to which ten stamps have been recently added.

Work on the Meldrum tunnel, which starts above Pandora and runs toward Red mountain, has been under management of A. Meldrum.

Telluride, April 12.

SAN MIGUEL COUNTY.

The Peck cyanide plant, Telluride, will start up as soon as tailings are thawed sufficiently to handle. They can treat 200 tons per day until the fall freeze comes.

On the Silver Bell, at Ophir Loop, twenty-five men are doing development work, and are obtaining regular shipments of first-class ore and a steady accumulation of second-class for the new mill.

SUMMIT COUNTY.

The reorganization of the North American G. D. Co. at Breckenridge was made last week. The company is incorporated under Maine laws, capitalization \$500,000; incorporators, C. A. Hight, H. P. Sweetser, Portland, Maine, E. C. Ramsdell, J. D. Upton, Boston.

TELLER COUNTY.

The Monument G. M. Co., Cripple Creek, has decided to increase its capital from \$300,000 to \$1,000,000. The increase of capital will be used to buy more mining property.—The Damon Co., Cripple Creek, has opened ore in the second level resembling chimneys which have heretofore been found in the mine.—Work on the Trail claim of the Battle Mountain Co., Cripple Creek, has opened the junction of two veins, showing 4 feet of ore, assaying from \$10.40 to \$53 per ton. The main workings of the Moon-Anchor, Victor, have been leased, and sinking will be started at 750 feet and continued to 1000 feet. Good ore is in sight in existing levels from veins coming from the Temomj and Midget.—G. W. Wilson, leasing in the Mabel M., Victor, will soon install a hoist, the recent work disclosing the top of an ore shoot. The Cyanide Leasing Co., operating several blocks of the Anaconda Co., Cripple Creek, have shipped eleven tons of ore that will go about seventeen ounces gold to the ton. The ore was taken from the main tunnel level of the Anaconda and up toward the surface. For the control of the lease \$20,000 is said to have been paid. The Anaconda Co. is working 100 feet below the tunnel level underneath the Cyanide L. Co.'s ground, to cut the same ore shoot.

A. C. Dake of Denver obtained a five-year bond on the main workings of the Rigi group, adjoining the Portland, Cripple Creek. A contract for an additional 400 feet of sinking in the shaft has been let.—The Golden Cycle M. Co., Cripple Creek, propose to construct a spur track from the railroad to the mine, estimated to cost \$25,000. The mine is producing eighty-three tons daily.—The shoot worked by Stumpf, Allison & Meyer, on the Whisper ground of the Gold Sovereign, Victor, dips into the Dante, and is now being drifted to from three levels of the Whisper shaft.—The president of the Doctor-Jack Pot Co., Cripple Creek, states that it has \$121,000 cash in treasury and 600 tons are not yet sold, one car of which is estimated to contain \$18,000. This came from the vein in the twelfth level, where there is 4 feet of ore, with a rich streak yielding twenty-five tons monthly, going about \$700 a ton. The net earnings for the first three months of the company's existence were \$400,000.

The Last Dollar G. M. Co., at Cripple Creek, are reported as intending to buy and install a compressor and drilling plant to cost between \$30,000 and \$40,000, to be used in exploring the mine below the 1050-foot level.

The Independence Con. Co. is considering thirty applications for leases and will probably grant a few. L. Reynolds of Leadville has a two years' lease on blocks 5 and 6.

IDAHO.

ADA COUNTY.

Supt. Wyman of the Checkmate mine, Pearl, says that free gold ore was found in the lowest workings; \$4500 was taken

out last month. From nine to twelve carloads of concentrates a month was being shipped, the ore concentrating to one-sixth.

BLAINE COUNTY.

The Crusus, the Hope, the Deadwood, the Big Camas, the Camas No. 2, at Hailey, are bonded.—The Liberal and the Maggie May group are reported as intending to build a 20-stamp mill.

CUSTER COUNTY.

L. Green, manager of the Clayton Smelting Co.'s plant at Clayton, will start the smelter soon.

IDAHO COUNTY.

It is reported that the Dewey, near Grangeville, will soon have a mill and cyanide plant. Mr. Jacobs, treasurer of the company, says that assays have averaged \$84 across the ledge, the ore being 10 feet wide.

Colonel F. Danford says a rich strike has been made in the McKinley, in the Simpson district. The new tunnel cross-ledge at 70 feet, showing free gold ore 3 feet wide. The mine is owned by Wardner people. G. W. Lucy, of Wardner, is superintendent.

KOOTENAI COUNTY.

A dredging company is building a dredger to rework the tailings of the old placer mines on Santa creek, 25 miles east of Tekoa, Wash.

Rich placer diggings are reported as discovered on Santa creek, about 25 miles east of Tekoa, Wash. Men are rushing in from Tekoa, Farmington and other points in the Palouse country. The Tyson Bros. are said to have taken out \$308 in coarse gold from a piece of ground 40x15 feet. The new camp is on a divide between the old Hoodoo and Cœur d'Alenes.

LATAH COUNTY.

Placer discoveries are reported on Meadow creek, at the head of Potlatch river, about 15 miles south of Santa. The discovery is on lands opened for entry last fall, and largely filed on by homesteaders.

NEZ PERCES COUNTY.

The superintendent of the placer mines at Salem Bar, near Lewiston, reports that the company is handling 600 yards of gravel daily, which prospects 50 cents a yard.

OWYHEE COUNTY.

The Blaine mill of the Trade Dollar Con. M. Co., at Silver City, is now operated by electrical power from Swain Falls on the Snake river.

SHOSHONE COUNTY.

The Terrible-Edith group at Murray have been bonded to H. McFadden, it is said on account of Senator Clark and his brother.—The Mullan M. Co. have the tunnel in 750 feet and will continue development work.—B. N. Hillard, for the Murray Development Co., has made a payment on the bond of the Oro Fino group at Murray.

Governor Hunt of Idaho has proclaimed the abolishment of martial law in Shoshone county.

MONTANA.

The Sapphire Mines Syndicate has resumed work on their mines at Yoga. They propose to sink several shafts on the lead and work from as many points, in order to increase the output.

BEAVERHEAD COUNTY.

The Greenwood M. & M. Co., operating a concentrator at Melrose, have purchased the right for Beaverhead county to use the pneumatic cyanide process and are erecting a 150-ton cyanide plant at the property for the purpose of treating the table tailings. The Colorado Iron Works of Denver, Colo., have the contract to construct the plant.

Melrose, April 10.

GALLATIN COUNTY.

O. P. Chisholm, who has bought the Moline mines, has bought a 10-stamp mill. He says the ore will run from \$10 to \$40 gold per ton.

LEWIS AND CLARKE COUNTY.

C. Warfield, agent for F. A. Heinze, has let a contract to H. R. Davies to sink the shaft on the Heinze property in Kenwood 100 feet deeper, the work to be completed in sixty days. The cost will be about \$3500 for this 100 feet, the first 100 feet costing about \$2000.

LIVINGSTON COUNTY.

J. M. McNulty, manager of the Montana-Milwaukee-Natural Bridge M. Co. at Contact, says the 10-stamp mill will be immediately freighted to the mines and that another aerial tramway will be erected. This will carry ore from the Imogene claim.

PARK COUNTY.

C. E. Elkin of St. John, N. C., has taken an option on the Bear Gulch mines at Jardine for \$1,100,000. The company has 450 feet of tunnel, cutting a vein with

a 20-foot wide ore shoot averaging \$15 in gold, and another vein 28 feet wide averaging about \$15. A second tunnel, in 500 feet, cuts four veins showing high-grade ore.

SILVER BOW COUNTY.

A. H. Wethey, general manager of Senator Clark's Montana mines, states that after May 1st the matte produced by the Butte Reduction Works will be treated at the smelter of the Amalgamated C. M. Co., instead of being shipped to the smelter of the Montana Ore Purchasing Co. at Anaconda. The amount of matte the latter have been treating has averaged 2,000,000 pounds monthly.

The Home Copper M. Co., bonding the Giantess group at Newmanville, is pushing development. A 40-foot drift on the lead at the 100-foot level shows 20 inches of ore the entire distance. Machinery is being put in to sink 400 feet. Sisley & Davidson of Butte are in charge of operations.

The syndicate, F. Farrell manager, which recently bought the Murray placer at Butte, for which it is said \$1,000,000 is to be paid, is sinking a shaft on the ground about 150 feet east of the drift of the Silver Bow No. 3. It is claimed this drift is in Murray ground and in a large body of rich ore from 5 to 15 feet wide.

The formal announcement is made in Boston that the Boston & Montana C. & S. M. Co., the Butte & Boston M. Co. and the Amalgamated C. Co. will consolidate. The directors of the two first named companies recommend the deposit of stock preliminary to arranging the consolidation which is to be accomplished by exchanging for stock of the Amalgamated Co. on an agreed basis. The arrangement is to be completed between the 25th of April and the 2nd of May, otherwise the stock will be returned.

Part of the Pennsylvania mine has been closed down by an injunction granted the Montana Ore Purchasing Co., and 250 miners had to be laid off. The action is part of the litigation going on between the Heinze people and the Amalgamated C. Co.

NEVADA.

ESMERALDA COUNTY.

J. L. Butler, the discoverer of Tonapah, says it is situated on the western foothills of the San Antonio range, on the east side of Montgomery district. The ledges run nearly east and west and have large black croppings that can be easily seen for a distance of at least 10 miles. The ore is in mineralized porphyry and the veins are from 1 to 4 feet wide. For years people have passed over these croppings and either took no samples or concluded there were too much of them to contain any great value. He made three trips there before he thought it worth while to make any locations. In the latter part of August, 1900, he visited the place, did some prospecting and brought away some samples of ore. The samples assayed 666 ounces silver and \$140 gold. He then returned, accompanied by Messrs. Oddie and Brougher, and eight claims were located, which are now known as the Butler Group. When he began to stake off the ground he found ore everywhere. The character of the rock is free-milling, and along the entire length of the ledges for several thousand feet pay ore is to be found.

Up-to-date, Tonapah contains two stores, three assay offices, three hay yards or corrals, four saloons, two chop houses and one photograph gallery. As yet only about a dozen frame buildings have been erected, but at least eighty tents have been pitched.

G. D. Burton, president of the Electric M. & R. Co. of Reno, has bought four mining claims 12 miles southeast of Hawthorne. A large lead was discovered several years ago, but little prospecting done on it; Portions of the lead assay from \$14 up. Mr. Burton has formed a company of Boston capitalists and development work will begin at once.

J. A. Brent and W. C. Price are reported to have bought the eight principal mines of Tonapah district for \$350,000. The new owners propose to erect a reduction works as near the mines as fuel and water can be procured. The exact location is not yet determined.

ORMSBY COUNTY.

A sampling works is projected for Carson City.

WASHOE COUNTY.

Kearney & Effricks' clean-up of 100 tons of gravel milled at the Slip at Olinghouse yielded \$6.50 per ton. The channel has been crosscut in pay 40 feet, with 3 feet depth. A tunnel is being run in the channel.

WHITE PINE COUNTY.

P. C. Weber, manager Sapho Co. at Ely, states that the main vein had been reached with the tunnel, the ore having all the appearance of carrying good values.

NEW MEXICO.

BERNALILLO COUNTY.

The mill of the Cochiti G. M. & M. Co., near Bland, is running about 6300 tons of ore per month. It is reported that by the adoption of the pneumatic cyanide process the slimes, with which they formerly had trouble, are being successfully cyanided, the saving amounting to 90% and the cost 60% lower than before.

Bland, April 10.

GRANT COUNTY.

The Modoc and a group of adjoining claims at Tierro are reported sold to C. T. Grayson of Silver City and G. Kingdom of Tierro for a large sum.

J. P. Olympius of Denver, Colo., one of the owners of the Lucero copper mines, near Mora, reports that the workings are in good ore, and that the company will sink a 1000-foot shaft and put in a smelter later.

The development of the Golden Era and building of its reduction plant are advanced sufficiently to anticipate starting the mill by April 25. Later an aerial tramway is proposed to connect the mine and mill.

The Clear Lake M. Co. of Carlisle, A. W. Tennant manager, has temporarily suspended operations to install a cyanide plant.—A strike is reported by the Steeple Rock Development Co. on property operated under lease. A stringer of high-grade gold ore is shown by assay returns to go \$4 to \$5 per pound.—The lease at Santa Rita of Mariano Isles has been secured by Riney, Herbert and L. B. Robinson, Bartlett and Winslow. The new leasers are putting up a steam hoist to sink the shaft 250 feet before crosscutting.

OREGON.

BAKER COUNTY.

The Crystal Palace M. Co., near Sparta, will erect a 20-stamp mill.

A. G. Lohmyre, an owner in the Buckeye mine, a new discovery near North Powder, says ore from 50-foot level is rich in gold, copper and silver.

In the Concord the big Blaine ledge is reported in the crosscut tunnel. The pay shoot is over 3 feet wide, and Pres. J. H. Robbins states that assays from the face average \$41.24, running from \$17 to \$195. This mine is located next to the Red Boy, and the ledge cut is one of the Red Boy ledges, being thrown on the Concord by a large porphyry dyke that crosses it.

GRANT COUNTY.

The Cougar mine, near Granite, is reported sold to Eastern people at a high figure. It has a 250-ton cyanide plant and \$100,000 expended in underground development.—The Magnolia is bonded to an English company.—The Climax group is bonded to C. L. Aldrin and men have been put on development work.

The Buffalo is drifting on a 24-foot ledge, 4 feet of which goes high in free gold; 2000 feet of development work has been done. It is owned by Portland people.

R. E. L.

Granite, April 15.

JOSEPHINE COUNTY.

A rich quartz find is reported on Josephine creek, 3 miles from Kerby. The ledge so far uncovered is between 4 and 6 feet wide and is exposed in the steep banks of Josephine creek. The whole face of the ledge is stated to be a network of gold seams. Six pounds of the rock pulverized and panned out yielded \$56.—J. T. Hagan has put a whim at the shaft on Fort Lane ledge which is now down 110 feet, and proposes sinking 100 feet deeper. The last 55 feet of this shaft is said to have produced \$80 a foot at \$12 per foot cost for the work.

SOUTH DAKOTA.

PENNINGTON COUNTY.

The Golden Summit mine has been leased for three years to a Mr. Beaver of Cedar Rapids, Ia. The mine is said to have produced \$60,000 in early days.

The Harrison mine, in the North Lead district, has paid to date about \$75,000 dividends out of a production of about \$150,000 gold. The underground workings are close to the surface, the ore lying in two flat shoots, which is said to average \$80 per ton. The intention is to erect a cyanide plant soon to treat large ore bodies of low grade. The mine is a producer of wolfram ore, there being about 100 tons now on the dump.

The American M. Co. have drifted from the shaft on Spearfish creek toward Ragged Top and have been bonding claims adjoining. The price to be paid is \$250 per acre, which makes about \$5000 per claim.

UTAH.

Liquid asphaltum is a late discovery reported by Indians on the Uncompahgre reservation. It is said to be valuable for the manufacture of gilsonite and ozokerite.

BEAVER COUNTY.

The suit for the Burning Moscow mine,

near Milford, has been decided in favor of M. T. Cullen, who states that he will resume its operation. There is said to be \$5000 value of ore on the dump.

BOX ELDER COUNTY.

The Globe M. Co. has incorporated to operate the Buckhorn and other claims in Park Valley district. The officers are F. Eberhardt, president; J. Marley, secretary, Salt Lake City.

JUAB COUNTY.

The Star Con. M. Co., Tintic, at the annual meeting, have made M. Packard president and C. F. Packard superintendent. The annual report showed \$68,000 receipts from sale of ore, debts paid \$35,184 and cash balance \$5000. The company propose to send their low-grade ore, going \$12 to \$17 to the ton, to the Bingham Co.'s smelting plant.

At 2000 feet depth in the Mammoth, at Tintic, ore has been struck going \$36 per ton in gold, with some copper and eight ounces silver. The strike was made, so Pres. S. McIntyre states, 300 feet north of the winze dropped down from the 1900-foot level.

N. N. Brown has sold the Bertha in West Tintic to F. Earls and a syndicate of Eastern investors for \$25,000, \$1000 dollars down, balance within a year.

SALT LAKE COUNTY.

It is said that the Utah Consolidated Co., or Highland Boy, of Bingham net earnings for the quarter ending March 31st were \$360,000. The smelter now treats 500 tons daily and forwards 1,000,000 pounds of bullion per month to the refinery.

The Black Bess M. Co. has incorporated; J. W. Langley, treasurer and secretary, Salt Lake City. The company owns the Stanley, Oregon and a portion of the Black Bess mining claim in Big Cottonwood mining district.

At the Ben Butler M. Co. annual meeting A. L. Jacobs was elected president and J. A. Jacobson superintendent of the mine at Bingham.

The Tintic M. & D. Co., G. H. Robinson, manager, has bought the Yampa group, at Bingham, for \$130,000 cash and 50,000 shares of stock. A compressor plant is being put on the mine.

The Deer Creek M. Co. has incorporated with a capital stock of \$1,000,000. W. H. H. King is president; J. B. Welmer, secretary and treasurer, Salt Lake City. The company will operate the Ohio group in Gold Mountain mining district.

The Highland Boy smelter, at Bingham, is turning out every twenty-four hours nearly 40,000 pounds of bullion. The eight McDougal roasters, three reverberatory furnaces and at least two of the set of converters are in operation, with an average consumption of 525 tons of ore.

SUMMIT COUNTY.

At the Daly-West, Park City, the incline below the 1400-foot level is down 255 feet—all in ore of excellent quality. Superintendent J. A. Kirby says the record for March was an output of 2800 tons of "shipping ore" and concentrates.

WASHINGTON.

FERRY COUNTY.

It is reported that the Brooklyn Copper-Gold M. Co., near Keller, have found the ledge widening from 2 to 6 feet and assaying \$24 a ton. Supt. G. F. Redner states that the tunnel will cut the other two ledges on the mine at depths from 400 to 600 feet.

At Republic the Princess Maud's north drift is in 150 feet. The ore looks better and it is believed a rich pay shoot has been entered.

The Flag Hill Co., Republic, are sinking a winze 140 feet north of the tunnel.

It is authoritatively stated that the Zala M. at Republic has been bonded to an English syndicate for \$1,000,000. The new owners will resume development on it and also on the Kitty Clyde, adjoining. They will put in a plant to treat the ore at the mine.

High-grade ore has been struck in the Republic above the 400-foot level. The average is said to be \$128 per ton. Manager Leckie says a few small specimens of copper minerals have been found in the lower workings.

OKANOGAN COUNTY.

W. Schmitz, manager of the Bright Spot mine at Weheville, says the shaft is down 30 feet in ore.

It is reported that the Golden Zone at Loomis, C. E. Meskimen manager, will put in an air compressor plant on the mine.

SNOHOMISH COUNTY.

A shipment of 1400 pounds of copper ore from the North Star Co. at Index gave net returns of \$33.—A consolidation of several mines at Index is proposed as the basis for the establishment of a local smelting plant.

YAKIMA COUNTY.

The Swauk placers at Liberty are said

to be yielding large nuggets this season, one of \$1000 value being found.

WISCONSIN.

BAYFIELD COUNTY.

The Chippewa C. M. Co. of Boston in development work on the Chippewa mine have found rock that runs from \$6 to \$30 in gold per ton and from 4% to 6% in copper, some silver and nickel—average \$20 a ton. The company have done 1200 feet of tunnels and drifts from a shaft down 200 feet, and plan to put on a stamp mill.

WYOMING.

A discovery of rich copper ore is reported in the Horse Creek copper district, 100 miles north of Cheyenne.

ALBANY COUNTY.

The Rambler copper mine, on Douglas creek, is shipping high-grade copper ore regularly.

UINTA COUNTY.

Developments in the lower workings of the Carissa, South Pass, show good ore.—The Rose mine has been bonded to V. Reed of Denver, Colo.

FOREIGN.

BRITISH COLUMBIA.

T. James, Supt. Onondaga M. Co., Rossland, reports that the 10-stamp mill should be ready for operation in a few weeks. In the meanwhile the showing of ore is being increased.

At Kitselass canyon, up the Skeena river from Port Simpson, are a number of quartz claims, some of which are being developed by S. Singlehurst and others of New York. Miners who have been working for them, while prospecting the adjoining district, found a quartz ledge which, the discoverers claim, assays over \$1000 to the ton.

A rich strike is reported on the Nettie L., at Lardeau. It consists of an 18-inch streak in a stope showing gray copper in quantity.

The Kootenay Mines shaft is completed to 1200-foot level and drifting on the vein has been commenced. The ledge on this level is about 40 feet wide and has a good-sized pay shoot. The shaft has been in the ledge from the 600-foot tunnel.

The Evening Star, at Rossland, has been temporarily shut down until road admits of hauling ore.

The miners at Rossland have voted down a proposed strike for higher wages.

C. Dempster of Rossland has made a payment on his bond on the Republic group at Slocan.

The Gold Commissioner's office at Dawson estimates the Klondike gold output for 1901 at \$25,000,000.

The Cariboo mine, at Camp McKinney, has the pay shoot of ore, milling from \$6 to \$50 a ton, opened for 1300 feet on the third level. The average width of ore is 4 feet.

The Lake Shore & B. C. C. M. & D. Co. of Chicago have incorporated to operate the J. S. & Blue Bell claims, in the Boundary district. The capital stock is \$150,000 and the incorporators are P. Welch, T. J. Ryan, J. Dorsey, J. P. Watt and T. W. Murphey.

The Miner-Graves syndicate intend adding to their plant at Phoenix a forty-drill compressor and a large hoist to work to a depth of 1500 feet, arranging to run either by electricity or steam.

The Wonderful ledge at Sandon is reported to have been found 4 feet wide between well-defined walls. W. W. Warner says when work was started the ledge was only 8 inches wide, and he regards its steady widening as a favorable sign.

CUBA.

The litigation over the Salomon copper mine at Las Minas has been decided favorably to the present holders, G. Salomon and H. H. Reilly of New York. They bought the land, including the mine, in 1899. After expending \$30,000 in development other parties claimed possession under an old document, which, according to the decision, did not cover the Salomon mine. Work will be commenced on an extensive scale.

MEXICO.

Reports from the Gold Coin P. & D. Co. of Colorado Springs, Colo., operating in Sonora, state they have bought several claims, on one of which, the Santa Rosa, near San Javier, are five veins from 2 feet to 16 feet in width, carrying high values in silver and gold.

The Sivirioja M. Co. has incorporated to work a number of claims in Fuerte mining district, Sinaloa. O. R. Nelson, of Chicago, is president and treasurer; P. J. Donohue, of Salt Lake City, general manager. Some of the claims are said to have been operated 100 years ago. Mr. Donohue says his examination indicated 100,000 tons of twenty-ounce silver ore on the dump. The company intends to begin development at once.

Personal.

JESSE SCOBY of Denver, Colo., is in Arizona.

CAREY WRIGHT, of Denver, Colo., is in Montana.

J. H. MINEAR of Ketchikan, Alaska, is in Boston, Mass.

FRED SEARLES, of Nevada City, Cal., is in San Francisco.

MARK B. KERR, of Grass Valley, Cal., is in San Francisco.

A. C. SEIBOTH of Denver, Colo., was recently at Globe, Ariz.

W. M. NESBIT, SR., is now Supt. Snowflake mine, Eureka, Utah.

J. G. MARX has resigned as Supt. Ely M. & M. Co., Ely, Nevada.

W. S. KEYES has returned to San Francisco from Mazatlan, Mex.

V. M. CLEMENT has returned to Salt Lake City, Utah, from Mexico.

J. T. FINLAN of Butte, Mont., is at Grass Valley, Cal., examining mines.

C. GRAHAM has been appointed Supt. Bellfontaine mine, Nevada City, Cal.

J. D. FRESH has been appointed Supt. Ramona mine, Galibani, Sonora, Mex.

F. E. WARE, manager Mount Shasta mine, Shasta, Cal., has gone to Chicago.

J. W. SHARPE, manager Mulatos mine, Sonora, Mexico, is in San Antonio, Texas.

W. MOREHEAD of Virginia City, Nev., is Supt. Yellow Aster mine, Randsburg, Cal.

WM. T. ST. AUBURN, formerly Supt. Gladstone mine, Shasta county, Cal., is in London.

W. H. WASHBURN has been appointed foreman in the Virtue Con. mines, Baker City, Or.

HAROLD T. POWER of the Hidden Treasure mine, Centerville, Cal., is in San Francisco.

M. L. MACDONALD, mining engineer of Butte, Mont., has returned there from New York.

J. MACFARLAND, manager Horseshoe mine, Pay, Nev., has gone to Peru to examine mines.

THOS. GREGORY of Lead, S. D., has been appointed Inspector of Mines of South Dakota.

SUPT. J. P. KEANE of the Cariboo mine, Camp McKinney, B. C., is visiting Spokane, Wash.

J. B. GALLAGHER, manager Daly estate mines at Copperopolis, Mont., is visiting Butte, Mont.

C. DORY, of Tintic, Utah, has gone to Ely, Nevada, as superintendent of the Ely M. & M. Co.

GEO. BERRIEN, formerly of Bodie, Cal., is now general manager Fisher Creek M. Co., Libby, Mont.

V. S. GARBARINI of Jackson, Cal., has been appointed Supt. Tisdale group, at Snettisham, Alaska.

S. J. SULLIVAN, manager of the Penn M. Co., at Leadville, Colo., has returned there from New York.

A. M. McDONALD has been appointed superintendent of the App Con. M. Co., Tuolumne county, Cal.

R. T. WHITE, Gen. Supt. Highland Boy smelter, Bingham, Utah, has returned there from New York.

WALLACE DINSMORE, of Marysville, Cal., is mentioned for Debris Commissioner. He is a lawyer and civil engineer.

JAS. C. H. FERGUSON, recently appointed Pacific coast sales agent for the Midvale Steel Co., has returned from Philadelphia to San Francisco.

CAPT. RICHARD MILLET has returned to Salt Lake City, Utah, after several months spent in Australia and New Zealand for British mine owners.

CHAS. S. ROOD, for many years associated with the late Richard C. Chambers, has succeeded him as manager of the Ontario and Daly M. Cos., at Park City, Utah.

Books Received.

"The Geology of the Central Portion of the Isthmus of Panama," by Oscar H. Hershey, is a bulletin recently issued by the University of California. The writer states he found evidences of very recent depression of the sea bordering lands on the Pacific side, and corresponding uplifts in the mountain axis of the isthmus, and notes the similarity of these evidences to similar phenomena on the California coast. For sale by J. C. Rowell, U. C., Berkeley, Cal.; price, 30 cents.

"A Treatise on Electromagnetic Phenomena, and on the Compass and Its Deviations Aboard Ship," Vol. I, by Com. T. A. Lyons, U. S. N., published by John Wiley & Sons, New York, 556 pages, 8vo.; twelve chapters, presenting in clear, readable text, with profuse and compre-

hensive illustrations, the theoretical part of electromagnetism. The author gives very fully the science as it is known now, showing its relations to light, heat, electricity and chemical action, including much valuable tabulated data obtained during the last few years. On a subject rapidly becoming more and more important, even in its more technical refinements, the publication is up-to-date. Price, \$6, post paid.

Commercial Paragraphs.

THE Burt Mfg. Co. of Akron, Ohio, have furnished the Midvale Steel Co., Philadelphia, Pa., with eight Burt exhaust heads in the last four months.

A LOGGING ENGINE, built by the Joshua Hendy Machine Works, San Francisco, weighs fifteen tons and is for the Sanger Lumber Co., Fresno county, Cal. It is capable of winding up 12,000 feet 1-inch steel rope.

D. HUG, manufacturer of the Hug water wheel, Denver, Colo., recently shipped a 3-foot wheel to Chihuahua, Mexico, and a similar one to Mr. Condett at Eureka, Colo., to develop electric power for drills, light and mill work in Picayune gulch.

THE American Bridge Co., through its Minneapolis office, has contracted with the Cananea Con. Copper Co. to furnish the buildings for their new mining plant at La Cananea, Sonora, Mexico. This will require about 350 tons of steel. They will also furnish the steel furnace and converter building for the Mountain C. M. Co. at Keswick, Cal.

THE Manufacturers' Association of Kansas City, Mo., has established a catalogue library, and requests all manufacturers and mercantile establishments to forward their catalogues, receipt of which will be duly acknowledged. Catalogues will be filed and indexed by the card index system, both as to firm name and subject matter of the catalogue.

THE Colorado Iron Works, Denver, Colo., are supplying a 36x192 copper matte furnace for the Clear Creek Reduction Co., whose plant is being erected at Golden, Colo. The equipment includes a Nesmith water evaporizing attachment, sampler, slag trucks and forehearths. The same company are furnishing a copper smelting furnace for the Hoffman Smelting Co. at Marble, Hinsdale county, Colo.; Bartlett tables, Cornish rolls and a reverberatory copper furnace for the Union Copper M. Co. of North Carolina; a 60-ton copper matter furnace for the Copper Crown M. Co. of Pictou, N. S.; two 42x142 lead smelting furnaces, with other equipment, for the Selby Smelting & Lead Co. of San Francisco; a 42x120 lead smelter for a plant in Belgium; also equipment for a stamp mill, with drying, roasting and concentrating machinery, to the San Luis M. Co., Durango, Mexico. They are preparing to operate all the machinery of their own shops by electric power, and are installing a 150 H. P. generator and motors driven by a new 170 H. P. Corliss steam engine.

Trade Treatises.

General Catalogue No. 20 of A. T. Ames, superbly illustrated, has been issued, giving sizes, capacities and constructive details relating to the Fulton pump, together with much useful information concerning pumping. The typographic make-up is excellent and in keeping with the high practical value of the catalogue, which can be obtained on application to A. T. Ames, Mfg., Galt, Cal.

Obituary.

WM. E. JOHNSON, under whose management the Florence & Cripple Creek Railroad was projected and built into the Cripple Creek mining district, Colorado, died in St. Paul, Minn., on the 7th inst. He was prominent in mining operations of Colorado and resided in Denver.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOTOR CARRIAGE.—No. 671,575. April 9, 1901. W. J. Woosley, San Francisco, Cal.

This invention relates to motor carriages. It consists in the mounting of the motor, intermediate and variable driving gears through which motion is transmitted upon the front axle of the vehicle and means by which the motor and associated mechanism are turnable in unison so as to steer the apparatus. It also comprises means for transmitting power directly to the front axle; and means for changing the speed and reversing the mechanism so that it acts as a brake.

GATE.—No. 671,582. April 9, 1901. J. G. Busch, Potter Valley, Cal.

This invention relates to a gate suspended from above so as to swing upwardly, and fulcrumed levers and connections by which it may be opened from either side by the approaching passenger. It also comprises latching devices, and slide rods on the gate for operating the latches and lever connections thereto.

CONVEYOR FOR ROPEWAYS.—No. 671,591. Dated April 9, 1901. A. S. Hallidie, San Francisco, Cal.

This invention relates to a conveyor attachment to be used for aerial wire ropeways, and is designed for the purpose of transporting sugar cane and other material that can be made up into bundles or packages. It comprises slings, a means for connecting the slings with the carrier traveling upon the standing rope, and means for disengaging and delivering the bundle at the end of the journey.

FRUIT GRADER.—No. 671,646. April 9, 1901. R. G. Bailey, San Mateo, Cal.

The object of this invention is to grade or assort globular or similarly shaped fruits into sizes. It consists of a horizontal rotating disk with a rim beveled or

sloping from the upper surface downward, and a series of adjustably curved rollers so spaced in relation to the rotating beveled surface as to permit the fruit, approximately globular in shape, to roll off in the proper place. As the rim or disk rotates over an inclined surface, the fruit will travel around the circle until it arrives at a space of sufficient size to allow it to pass while guides direct it to suitable receptacles.

List of U. S. Patents for Pacific Coast Inventors.

Latest Market Reports.

SAN FRANCISCO, April 18, 1901.

SILVER.—Per oz., Troy: London, 27³/₄d (standard ounce, 925 fine); New York, bar silver, 59¹/₂c (1000 fine); San Francisco, 59¹/₂c; Mexican dollars, 49¹/₂c San Francisco, 48c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62¹/₂; Casting, 1 to 3 casks, \$16.75; carload lots, 16.62¹/₂. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £70 3s per ton.

It is said that efforts are being made by the Amalgamated to induce the Rio Tinto to limit production. In the United States the Heintze litigation is accomplishing this result.

LEAD.—New York, \$4.37¹/₂; Salt Lake City, \$4.00; St. Louis, \$4.27¹/₂; San Francisco \$5.00, carload lots; 5¹/₂c 1000 to 4000 lbs.; pipe 6¹/₂, sheet 7¹/₂, bar 6c; pig, \$4.70 @5.10. London, £12 7s 6d per ton—2.78¹/₂ cents per lb.

SPELTZ.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton = 3.58¹/₂ cts. per lb; San Francisco, ton lots, 5¹/₂c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 29c; 1000 lbs., 29¹/₂c; 500 lbs., 29¹/₂c; less, 30c; bar tin, \$35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.00 per flask of 76¹/₂ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5¹/₂c; slab, 5¹/₂c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18¹/₂c; San Francisco, Plumbers', 100-lb. lots, 15¹/₂c.

FERRO-TUNGSTEN.—New York, 37¹/₂, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb, small lots.
BISMUTH.—New York, \$3.00, \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 25-lb lots.

PLATINUM.—San Francisco, crude, \$22 per oz.; New York, \$22 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¹/₂c; less than one ton, 17¹/₂c. No. 1*, 60%, carload lots, 13¹/₂c; less than one ton, 15¹/₂c. No. 1** 50%, carload lots, 11¹/₂c; less than one ton, 13¹/₂c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¹/₂c; less than one ton, 11¹/₂c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10¹/₂c per set; 14 oz., 40s., 9¹/₂c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32¹/₂@33¹/₂c per lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66¹/₂ B, 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 24@3c per lb.; blue vitriol, 5¹/₂@6¹/₂c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2¹/₂@2³/₄c; California refined, 1¹/₂@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; ska, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14¹/₂c; do., cs., 20¹/₂c; 86° Gasoline, bulk, 20c; do., cs., 26c; 65° Naphtha or Benzine, deodorized, in bulk, per gal., 13¹/₂c; do., in cs., 19¹/₂c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's' bbls., 60c; cs., 65c; No. 1 bbl., 50@52¹/₂c; cs., 55@57¹/₂c.

Valuable Hydraulic Mining Property,

located in Plumas County, Cal., containing 273 acres, title U. S. patent, water rights, ditches, etc., **FOR SALE AT A BARGAIN.** Terms easy. For further particulars, apply to ALMARIN B. PAUL, 37 Crocker Building, San Francisco, Cal.

FOR SALE.
Gold Dredging Land.

About 100 acres on river in California; few miles from railroad. Nine dredgers making big money in vicinity; other dredgers building. Land estimated to hold \$8000 gold dust to acre; 30 feet deep. Bond given. Address Box 40, this office.

FOR SALE.

A Bruckner Roaster, 8'6"x26'6", with fire-box complete; also Chlorinating Barrel, 5'x9'.

Machinery new, never having been set up. Will sell at a discount f. o. b. Denver.

Address Box 949, BOISE, IDAHO.

FOR SALE.

ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

THE S. H. SUPPLY CO.,
THE MACHINERY DEPOT
OF THE WEST.

22d and Larimer Streets, DENVER, COLO.

We have a 10x12 Lidgerwood Geared Hoist which is in as good condition as new. This is an exceptional bargain. We are offering it at \$950. The only objection we have to quoting prices in our advertisements is that a connection might be made between the price and the condition of the machine. This is not the case in this instance. Among the other hoists which we have are:

6x8 Double Friction, New.
10x12 Double Friction.
12x16 Double Drum Geared.
11x15 Double Drum Geared.

We do not buy a boiler until we have the State and city inspection bureaus pass on it and state that they will issue a certificate as to the amount of pressure it will safely carry. This class of boilers, while not as cheap at first cost, are a great deal cheaper than those which you may find after a few weeks' service are condemned boilers. We also think we have the lowest prices on new standard and high pressure Boilers. The ones on hand at present are:

2 100 H. P. Heine Water Tube.
2 80 H. P. Horizontal Tubular.
1 60 H. P. Horizontal Tubular.
2 40 H. P. Horizontal Tubular.
2 35 H. P. Horizontal Tubular.
15, 10, 8 and 6 H. P. Vertical.

Feed Water Pumps and Tank Pumps in every size that is made. We test all our pumps before sending them out. They are all guaranteed to give good service:

12x8½x10 Worthington Duplex.
12x12x12 Davidson Single.
10x5½x12 Deane Duplex.
10x5½x12 Smith-Vale Duplex.
12x7½x12 Marsh.
5½x4 Fairbanks.
Every size and make Boiler Feeds.

You know that we issue a catalogue every two months which can be had for the asking. This gives a good idea of our stock, and all prices are placed at the net prices so that you can tell just what it will cost you.

There is no question about our having the trade on Wrought Iron Pipe and Fittings. Send for quotations. We know that we can sell you pipe at saving over any house in the city. These are new goods.

SITUATIONS WANTED.

ASSAYER, BOOKKEEPER, TYPEWRITER and General Office Man desires a situation. Ten years' practical experience. Best references given. Address A. Sayer, care of Mining and Scientific Press office.

Wanted by Mining Engineer, experienced in the West, moneyed partner to help form mining development company. P. O. BOX 971, DENVER, COLORADO.

First-Class Amalgamator

Wants position to take charge of Quartz Mill. Years of experience and best of references. Address H. T., this office.

ASSAYER AND CHEMIST, who understands surveying, desires position with some large mining company. Long experience in a Spanish-speaking country. Thorough knowledge of Spanish. Will start with a small salary where there is a chance for promotion. Address G. F., care of this office.

Engineers, Firemen, Machinists, Electricians: Send 10 cents for new 40-page pamphlet, containing list of questions asked by examining Board of Engineers. GEO. A. ZELLER, Publisher, St. Louis, Mo.

WANTED.

Wanted, by May 1st, two first-class amalgamators to run a 10-stamp mill; one must be a machinist. Only first-class men with reliable reference need apply. Wages satisfactory to the right men. Camp 35 miles from Roseland and 7 from railroad. Good accommodations. New mill and steady work. Reference: Bank of British North America, Roseland. Address T. JAMES, Supt. Onondaga Mines, Roseland, B. C.

ACUITAPILCO DISTRICT!

Wanted, partner with \$10,000 gold for development; can get half interest in gold, silver and lead mines (five). Plenty of concentrating ore averaging 25 ozs. silver to the ton of 2000 lbs.; gold, ¼ oz. Water power and timber close to the mines.

LIC ELIAS GALINDO, P. O. Box 26, Tepic, Mexico.

Bond and Lease Offered.

Will give bond and lease on the Franklin & Union group of two patented claims on Turkey creek, Bradshaw mountains, 20 miles south of Prescott, Arizona. Has 600 feet development work, showing good body of high grade silver ore. Correspondence solicited.

P. P. BUSH, 1607-17th St., Denver, Colo.

BRITISH COLUMBIA MINES.

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investment in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew P. Rosenberger, P. O. Box 700, Nelson, B. C.

We make a specialty of all kinds of Heavy Sheet Iron and Steel Work. Plans and Estimates furnished.

A PERFECT ROOF==

P. & B. Ready Roofing makes a perfect roof—the destroying influences of fumes, vapors, moisture, heat, cold, snow, gases and acids do not injuriously affect it.

The superintendent of the United Verde Copper Company at Jerome, Arizona, says:

"We have had your P. & B. Roofing on one of our buildings, which had a heavy sag in the center, for four years, was filled with water constantly from the exhaust steam, and flue dust from the smelter, making a combination of sulphuric acid on that roof. It never leaked a drop, and when examined the roofing material was found in perfect condition, showing me your roofing was all you have claimed for it. The works have been covered with P. & B. Roofing for eight years.

P. & B. Ready Roofing is cheaply and easily transported.

Booklet gives complete information—it's free—address Department A.

"THE DANIEL BEST" 50 Horse Power TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, **50 HORSE POWER.**

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

## THE BEST MANUFACTURING COMPANY, San Leandro, California.

### THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/2" wide by 1 1/2" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

# THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

CONSTRUCTION SUPERVISOR.  
331 Pine Street, San Francisco, Cal.  
Telephone Main 1870, Cable Address "Edben."

**FRANK C. MANDELL,**  
MINING ENGINEER,  
U. S. Deputy Mineral Surveyor for Idaho  
and Oregon.  
Mine Examinations, Surveys and Reports.  
HAILEY, IDAHO.

**W. H. STROUT & SON,**  
361 Bennett Ave., CRIPPLE CREEK, COL.  
Assayers and Mining Engineers.  
Bullion Melted, Refined, Assayed and  
Purchased.  
Price of Assays: Gold (crucible), 50c; Gold  
and Silver, 75c; Gold, Silver and Copper, \$1.50;  
Lead, 50c; Copper, \$1.00; Zinc, \$1.00.  
Established in Colorado in 1876.

**ERNEST H. SIMONDS,**  
Late Instructor in Assaying, University of  
California.  
**ASSAYS AND ANALYSES.**  
**LABORATORY TESTS OF ORES.**  
SPECIAL ATTENTION GIVEN TO THE  
INSTRUCTION OF STUDENTS.  
REMOVED TO LARGER QUARTERS  
at 417 Montgomery St., bet. California  
and Sacramento Sts., Third Floor, San  
Francisco, Cal.

**RICHARD A. PEREZ, M. E.**  
Assayer and Analytical Chemist,  
120 North Main St., - Los Angeles, Cal.

**ALMARIN B. PAUL, M. E.**  
Room 27, CROCKER BUILDING, SAN FRANCISCO.  
Will act as AGENT for the sale of RELIABLE  
Mining Property. Also for securing suitable  
machinery for fairly developed gold mines in  
California, for interests in the same.

**RALPH E. STEVENS,**  
ATTORNEY AND COUNSELOR,  
42-44 Jacobson Building, DENVER, COLO.  
Special attention to examination of titles,  
Corporation, commercial, mining law. Collec-  
tions receive prompt attention. Notary in office.  
Refers to Denver representative of Mining and  
Scientific Press

**T. D. KYLE & CO.,**  
Assayers and Chemists.  
Mill Tests of all kinds. Cyanide, Amalga-  
mation and Concentration a specialty. Mail  
orders given prompt attention.  
106 E. Fifth St., Leadville, Colo.

**School of Practical Mining, Civil,  
Mechanical and Electrical Engineering.**  
Surveying, Architecture, Drawing, Assaying,  
Cyanide Process and Metallurgy.  
113 Fulton St., one block west of City Hall, S. F.  
OPEN ALL YEAR. A. VAN DER NAILEN, Pres.  
Assaying of Ores, \$25; Bullion and Chlorination  
Assay, \$25; Blowpipe Assay, \$10. Full course  
of Assaying, \$50. Established 1864.  
Send for Circular.

**D. G. JEWETT,**  
METALLURGIST AND ASSAYER.  
Specialty: Mining and the Reduction  
of Ores.  
ALMA, PARK COUNTY, COLORADO.

**W. H. W. HAMILTON,**  
Consulting Mining Engineer,  
SUMPTER, OREGON.  
Correspondence solicited from parties desir-  
ing first-class mining propositions. Expert  
examinations of and advisory reports on any  
mining proposition. The development of  
mines by modern methods a specialty.  
Moreing & Neal code.

**LETSON BALLIET,**  
Mining and Civil Engineer,  
Chemist and Metallurgist,  
508 California St., San Francisco, Cal.  
Special attention to treatment of low grade  
and refractory ores by all chemical and me-  
chanical processes.

**Simonds & Wainwright,**  
Mining Engineers,  
Assayers and Chemists,  
159 Front Street,  
NEW YORK.

**HUDSON H. NICHOLSON,**  
Consulting Mining Engineer,  
Rooms 216 and 217, Boston Building,  
DENVER, COLO., U. S. A.  
Cable address: Aichen, Denver.  
Expert examinations of and advisory reports  
on mining propositions.  
Specialty: The chemical treatment of ores.

**S. W. TYLER,**  
Mining and Metallurgical Engineer,  
8 Windsor Hotel Block.  
Cable: Retyl, Denver. DENVER, COLORADO.

**ALFRED HARVEY,**  
MINING AND MECHANICAL ENGINEER,  
P. O. Box 971, DENVER, COLO.  
Examination and management of mines.  
Treatment of Ores Investigated. Plans for  
mining, milling, and automatic sampling plants.

**HOWARD E. BURTON,**  
ASSAYER and CHEMIST,  
111 E. Fourth St., LEADVILLE, COLO.  
Specimen prices: Gold, 50c; Gold and Sil-  
ver, 75c; Gold, Silver and Lead, \$1.00; Silver  
or Lead, 35c; Copper or Zinc, \$1.00.  
Mailing envelopes sent to any address.

**W. J. ADAMS, E. M.,**  
Mining Engineer and Metallurgist.  
Graduate of Columbia School of Mines.  
Author of "Hints on Amalgamation," etc., etc.  
ROOM 14, 434 CALIFORNIA STREET,  
SAN FRANCISCO, CAL.

**CLARENCE HERSEY,**  
Assayer and Chemist,  
(Established 1879), LEADVILLE, COLO.  
Gold, Silver and Lead, \$1.00.  
Any two of above 75c; any one of above 50c.  
Copper analysis, \$1.00.  
Platinum, Nickel or Tin, each, \$5.00.  
Twenty-one years successful experience in  
the mining metropolis of Colorado.  
Write for mailing envelopes and price list.

**U. S. Gov't Assay Office.**  
**A. L. PELLEGRIN & CO.**  
Public Sampling Works  
and General Assaying.  
NOGALES, ARIZONA.

**LOUIS FALKENAU,**  
STATE ASSAY OFFICE,  
538 Sacramento St., below Montgomery.  
Analysis of Ores, Metals, Soils, Waters, In-  
dustrial Products, Foods, Medicines, etc., etc.  
Court Experting in all branches of Chemical  
Technology. Working Tests of Ores and In-  
vestigation of Metallurgical and Manufactur-  
ing Processes. Consultations on all questions  
of applied chemistry. Instructions given in  
assaying and all branches of chemistry.

**ABBOT A. HANKS,**  
CHEMIST AND ASSAYER.  
Successor to Henry G. Hanks, est.  
1866. The super-  
vision of sampling  
of ores shipped to  
San Francisco a  
specialty.  
—531—  
California Street,  
San Francisco.

**J. S. J. LALLIE,**  
1822 Arapahoe St., Denver, Colo.  
Manufacturer of and Dealer in Mining  
and Civil Engineers' Instruments and  
Supplies. Inventor and manufacturer  
of a New UNIVERSAL open sight  
Transit Compass that reads ANY hori-  
zontal or vertical angle to single min-  
utes. Made of Aluminum. Has Exten-  
sion Tripod and Plum Bob. Weighs  
complete in sole leather sling case 3 lbs.  
The Colorado House, established 1888.

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore.  
OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tail-  
ings, and our record of results—showing in almost every instance achievements on the large scale such  
as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a  
Specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes;  
our experts, however, are constantly devising improvements, the latest being a method of overcoming  
the difficulties which have hitherto prevented the successful handling of ores containing copper and  
also a method for the profitable handling of silver ores by cyanide.

## DEWEY, STRONG & Co.,

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

AND 918 F STREET, N. W., WASHINGTON, D. C.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced  
first-class agency. We have able and trustworthy associates and agents in Washington and the capi-  
tal cities of the principal nations of the world. In connection with our scientific and Patent Law Li-  
brary, and record of original cases in our office, we have other advantages far beyond those which can  
be offered home inventors by other agencies. The information accumulated through long and careful  
practice before the Office, and the frequent examination of patents already granted, for the purpose of  
determining the patentability of inventions brought before us, enables us to give advice which will  
save inventors the expense of applying for patents upon inventions which are not new. Circulars and  
advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market  
St., San Francisco, Cal.

## SOLAR HOUSE LIGHTS

For houses not having gas or electric  
light service, and for those that have,  
but wish economy and independence.

Costs \$4.00 Per Light

EACH LIGHT LASTS A  
LIFETIME

Gives a steady light, brilliant as electricity,  
and whiter. Needs any town gas service in  
existence. No complications; nothing to get  
out of order. Simple as A, B, C. Handy as a  
"candle"—jets can be carried around anywhere  
in the house. Gas cannot escape, like from the  
town mains. No smell, no smoke and no danger,  
as with kerosene or gasoline. No accident  
of any kind possible, and the whitest, steadiest  
and richest light that is known.  
Write us for particulars.

# THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.: "We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

**MAIN BELTING COMPANY,**  
1235-41 Carpenter Street, Philadelphia.  
55-57 Market St., Chicago. 120 Pearl St., Boston.

# CATES IRON WORKS

## MINING MACHINERY.

Among Our Great Specialties Are:

### HOISTS.

This is a type of a very strong, well-designed machine, single or double drum.

### BRUCKNER ROASTERS.

In this line we have equipped some of the most important plants. We furnish all the accessories of a complete installation.

### IRON JIGS.

We take special pride in directing attention to a first-class jig shown in this cut.

### SMELTING FURNACES.

Our furnace line includes Lead, Copper, Round, Rectangular, Reverberatory, Cupelling, Wrought Iron, Cast Iron, and all accessories.

### CONVERTERS.

This specialty is strictly up-to-date, with every possible feature of a perfect plant. We have introduced some very important features in copper converter installations.

### TILTING CRADLES.

This small cut will give an idea of the construction of this machine. All the cuts in this ad. made direct from the originals on our shop floors.

NEW YORK OFFICE,  
11 BROADWAY.

## ASSESSMENT NOTICES.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of April, 1901, an assessment (No. 22) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
ALEX. GRANGER, Secretary.  
Office—Room 223 Crocker Building, San Francisco, California.

**LARKIN MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of March, 1901, an assessment (No. 10) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of April, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
N. F. REMINGTON, Secretary.  
Office—112 Main street, San Francisco, California.

**SOUTH SLIGHER GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Spanish Dry Diggings Mining District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of March, 1901, an assessment (No. 1) of two cents per share was levied upon all the issued or subscribed for capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 402 Front street, Room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
J. L. DANIELS, Secretary.  
Office—402 Front street, Room 8, San Francisco, California.

**AMERICAN OIL AND REFINERY COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of March, 1901, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 323 Parrott building, 825 Market St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
J. C. ANTHONY, Secretary.  
Office—Room 323 Parrott building, 825 to 855 Market St., San Francisco, California.

## DRY PLACER MACHINES.

### THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

### NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

### THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

# THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully,

ORIGINAL EMPIRE MILL & MINING COMPANY,  
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

ROBT. WALKER, Superintendent.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours,

ROANOKE MINING COMPANY,  
MOKELUMNE HILL, March 4, 1897.

Per G. M. WILDE, Acting Superintendent.

## Where Petroleum Is in California.

Geological surveys have determined the occurrence of petroleum in California to be limited to a series of strata—conglomerates, shales and sandstones—that are comparatively young rocks. In technical geological language they are rocks of the later (upper) Secondary Age, Cretaceous, and of the Tertiary Age, Eocene and Neocene. The strata are very little or not at all metamorphosed, are fairly conformable and, with the exception of some local beds, are known to have been formed in salt water, as they contain fossils of marine animals. Some local beds are known to have been land-formed, coal-bearing formations and lake beds, as there are found in them fossils of land animals and land plants. The presence of these land-born strata bedded with the others does not carry with it any inference of uncertainty as to the beginning of the petroleum being in the sea-formed beds. The topographical life history of the area now known as California, read from the structural geology, clearly admits of not only the possibility, but the probability that some portions of the area were submerged at one time by sea waters and at another time by fresh waters. In the first case the rock-forming sediments might accumulate marine plant carbon, which might have subsequently become petroleum, and in the other case they might accumulate land plant carbon which might have subsequently become coal.

The petroleum-bearing rocks have been referred to as comparatively young rocks. Underlying them, and constituting the old land surfaces, from which came the sediments to build the petroleum-bearing rocks, are a distinctly different series. These are geological rocks of Primary Age, Silurian, Devonian and Carboniferous and rocks of the earlier (lower) Secondary Age, Jura-Trias, the gold-bearing series. These strata, with very few observed exceptions, are highly metamorphosed, the stratigraphy or order of strata is uncertain and there is a marked break in succession, an unconformity where they come in contact with the series of rocks first described. They

are not petroleum-bearing or coal-bearing, but are noted as metal-bearing, being the lode home of gold, silver, copper and quicksilver.

The preliminary step to determining the probable place of formation of the strata which might become petroleum-bearing is a reconstruction of the topography of the area. On page 201 is a plat showing a suggestive reconstruction of the land and water areas of what is now California, at the beginning of the period in which the now petroleum-bearing sediments were accumulated. Opinions can differ as to the details, for example, the division and number of coastal islands, but the general scheme of construction is rather more than possible—it is

logically probable. There is a striking similarity observable between this reconstructed Upper California with what Lower California and the Gulf of California are now, and with what the island-bound coast of southeastern Alaska is now. The reconstruction of the map is made by plating the lines of surface contact of the old metamorphic rock formations with the younger series. What are now the Coast Range mountains must then have been a group of islands, and the area where now are the Cretaceous and Tertiary sandstones, shales and conglomerates must then have been sea water.

Examining the plat, and taking cognizance of the knowledge that sediment-laden streams then flowed both from the main land and islands, it is readily apprehended that the sediments could form rocks, known now as petroleum-bearing, in the shallow waters next the island and mainland coasts and on shallow banks that could, and doubtless did, exist in the old sound.

Inorganic nature by physical law accomplishes a selection of physical conditions ending in local geological phenomena, just as organic nature accomplishes by affinities a selection of individuals ending in the survival of the type of the fittest. So with this vast area of possible petroleum-bearing lands, nature has selected, by first eliminating: the mainland shore areas generally, because the sediment accumulating was out of proportion to the possible accumulation of carbon from marine vegetation; the areas at the mouths of island streams, from the existence of the same condition; areas along the island coasts where the water was too deep, admitting only a narrow line of possible accumulation; areas where the marine plant growth was scanty; areas where the plant remains had accumulated sufficiently, but the metamorphism of heat went too far, or not far enough; and areas where the folding and tilting of the strata has released the once-existent petroleum to the atmosphere, or buried it too deep for commercial effort; and what after these eliminations is then left—"oil lines" or "oil pools"—are the places where petroleum now is.

A MINE is not exclusively a work of nature. Nature provides raw material in a metal-bearing deposit more or less remote from the point of desired use. The metal is more or less in mechanical and chemical combinations with minerals that it must be separated from before it is available. From this raw material man and money build the mine. Money, which is the conserved physical energy of many men, and man, the intelligent force that plans and contrives with money to build in the raw material the structure, which built, is then a mine. The struggle to make a short cut to wealth through the discovery of a mine, the finding of a treasure created and buried by nature, has enormously increased the number of people who are prospecting everywhere through possible and even impossible areas for valuable mineral. These newcomers to the industry are not miners and to their inexperience it seems very simple. They have only to find the place where the valuable mineral indicates its existence. Then is fortune—the fortune they have sought—their own. In reality, they have only found possible raw material for a mine. The float that pans gold, the croppings that show mineral, the specimens that give high assays, only indicate where there may be raw material; they are not surely even the beginning of a mine. Some money and some knowledge must first be used to determine if there be even the beginning. Much delay and disappointment can be avoided by recognition of this fact. Miners, as a rule, do recognize it; but the newcomers, seemingly, have to be disappointed, not once, but many times, before comprehending this fundamental fact. The people who rushed from other avocations than mining to Alaska and the Northwest to find fortune in the mines, are those who most need this knowledge of what a mine really is, and how, and at what cost it is made. These well-intentioned people have devoted their energies to the locating of claims, not to the making of mines or a mine. As a consequence, vast areas of land well worth careful prospecting are practically withdrawn from exploration. In some exceptional instances a surface showing justifies a cash purchase by capital; but the tenderfoot locator does not even make a surface showing, just however expecting to sell as if it was a developed mine. What he should do first is to open the surface either by cross or longitudinal stripping, breaking into the solid lode formation at many points. Assay many samples and establish the surface extent of apparent payable values. Next either tunnel or sink one or more

shafts in the apparent payable surface. These things done there is then sufficient in sight if values continue underground to invite the assistance of capital in carrying the risk of the further exploration and opening which may make the mine. All this examination and preparation consumes time and requires labor. In the short season of the North one or two claims or a single group is the practical limit of a prospector's ability. Location of more than this is simply time and energy wasted by scattering. Efforts to find in any locality the raw material for a mine must be concentrated to be effective and particularly must they be so in Alaska.

In a few weeks the President of the United States will dedicate a commemorative fountain in front of this office to the mechanics of San Francisco. It stands a massive structure of bronze and granite of striking appearance, erected at a cost of \$25,000—a bequest by the Donahue estate. The Donahue foundry and machine shop was the original establishment from which grew the great Union Iron Works, and it was the mining industry that created the establishment which has since built sea-going vessels that have added new renown to the American navy. In connection with the gift of the Donahue estate in the shape of the fountain that will embellish San Francisco's great thoroughfare, it is worthy of note that the second casting that ever came from the old Donahue foundry was for a stamp mill. N. W. Spaulding, now in the saw business on First St., San Francisco, built the first quartz mill made in San Francisco. Two primitive mills had been shipped from Boston in 1850—one for Grass Valley, Cal., the other for Mr. Spaulding for the Middle Fork of the Tuolumne river. During stress of weather on the voyage, Mr. Spaulding's mill was thrown overboard to lighten ship. He had whipsawed the lumber for flumes, etc., and on coming to San Francisco for his mill, and learning of his loss, he paid 40 cents a foot for lumber to make patterns, and paid Peter Donahue 30 cents a pound for some castings—the second lot cast in the old Donahue foundry, the first casting having been a new crank for the Sacramento river steamer McKim. The Grass Valley mill was about a month ahead of Mr. Spaulding's San Francisco built mill. All this was just fifty years ago; and when, on the 21st of next month, the President of this nation of 80,000,000 people dedicates the monument in front of our window to California miners and mechanics, the minds of a few pioneers will go back to the small beginnings of half a century ago, when in this west half of America was being laid the foundations of a great industrial empire.

THE article on "Pneumatic Processes for Leaching and Cyaniding," by Dr. J. Ohly, should have the consideration of those engaged in mining the sulphide ores carrying gold, silver and copper. Many mines of these ores are so remote from smelters that unavoidable transportation charges make profit through shipping impossible, and smelting at the mine is prohibited either by the difficulty of securing an economical furnace charging mixture of ores or the cost of fuel transportation. Under such conditions improvements in wet methods, leaching, cyaniding or electrolytic, are the hope of the miner. Methods which make it possible to get the values out of the ore at the point of production are particularly what the small mine needs. Concentration of valuable mineral from waste has accomplished a great deal, but the field for such methods as Dr. Ohly describes is much wider and inclusive largely of the field occupied now by concentrating methods. The particular merit of these processes is in the simplicity of their requirements in the way of plant, chemicals, reagents and expert attendance. The structures and machinery required are not costly as compared with the requirements of smelting plants. The chemicals employed except the cyanide of potassium can be manufactured on the ground where the process is not itself regenerative of the active reagents. The knowledge of the manipulation necessary is readily acquired and is further largely mechanical. The miner, at the end of his treatment, has the gold and silver from his ore in a form in which he can realize on it directly. The mints coin the gold and the silver has the market of the world for its own. Copper the miner has as "cement copper," a form in which to realize on it he does not have to pay transportation charges on waste.

## Magnetic Concentration of Iron Ores.

Enormous deposits of magnetic iron ore, too low in percentage of iron to be economically smelted directly, but capable of cheap concentration to sixty-four per cent of iron by the Edison magnetic concentration process, have been discovered in Norway. English iron and steel makers are reported as proposing to furnish the capital for the exploitation of these deposits by this process. They expect using this concentrated ore to be able to meet successfully the competition of the United States steel makers.

However this last may be, the adoption of the Edison process is a commercial recognition of the merit it possesses for use within its natural limits. The popular impression in the United States has been persistent in declaring the process a failure, judging from the economic failure of the great New Jersey plant. The fact was that the process as a process did not fail in New Jersey. Technically it succeeded in accomplishing what was claimed for it. The truth was that it was applied commercially outside of its natural limits. The rock that was treated only contained eight per cent of magnetite, the commercial sale return of which was too small to carry the cost load of mechanical treatment of ninety-two per cent of waste rock. In Norway the process is to be applied to a rock containing from fifty to seventy per cent of magnetite, the sale of which can pay for the handling of thirty to fifty per cent of waste. The Englishmen seem to have grasped the profit possibilities of the process through the discredit that attached to it as a result of misplacing its application, and are apparently not backward in using it. Some years since a Welsh iron making company made a contract with Lake Superior ore producers for the delivery to them of some four millions of tons at \$5.20 a ton. Recent lessening of costs of manufacture in American mills has made this source of raw material supply too costly for English mills.

The idea of Edison's New Jersey plant, in the light of progress since, was clearly correct. It aimed to eliminate human labor as a major factor in cost and to eliminate transportation, which succeeding labor would become the only reducible major factor. These two factors constituted the line of least resistance. The enterprise failed commercially because the same thing was done at the Lake Superior mines, in means of transportation of the ore to the furnaces, and in the metallurgy at the furnaces. A commercial condition admitting of profit to the New Jersey enterprise when it was planned did not exist when the enterprise was operating. Mr. Edison and his associates forgot that the other fellow was thinking, too.

The reduction of cost to the consumer on the line of least resistance is still taking place. Within the last two years the men who make iron and steel in Ohio and Pennsylvania have been investigating the iron ore deposits on the Pacific coast and in the intermountain region between, but particularly the former. The production of the metal from the ore on this coast will cut off a railroad transportation cost that will be of great commercial advantage in supplying the demands of eastern Asia, the great market for years to come. It must be recognized that the Chinese, having iron and coal deposits, will in the end use their own raw materials and their own labor to manufacture iron and steel. The coming of that end can be deferred by reducing the costs of the foreign production intended to supply the Chinese demand. If this reduction can be done by eliminating rail transportation, of either ores, fuel or finished product, the Pacific coast will become the place of a great metal producing industry.

On this Pacific coast the magnetite ores exist under conditions that would seem to make processes of magnetic concentration specially applicable. Aside from the low grade, there are mechanical impurities that magnetic concentration can eliminate. Pyrite and titanite iron are the more common. Neither of these is magnetic and both are mechanically associated with the magnetite. The writer is also advised of the existence with these of chalcopyrite, the common copper bearing mineral. This last, if only in small quantity, one or two per cent, would become concentrated to a valuable commercial mineral by separating magnetically. With these commercial profit possibilities Pacific coast miners can well afford to look for and develop such deposits.

## Concentrates.

THE legal measure of water in Utah is 1 cubic foot flow per second.

THE wear and tear of gold coin in circulation is estimated as being 1 1/2%.

THE loss of power in transmission from the electric generators at Niagara to Buffalo is 20%.

MAIL carriers to and from Nome, the route being over the Ice by Dawson, charge \$1 an ounce postage on letters.

THE gold production of the province of Victoria, Australia, for the first two months of this year is \$2,000,000.

A 15X9 1/2-INCH rock breaker is estimated to require about 10 H. P., belt concentrators from 1 to 1 1/2 H. P. each.

ACETYLENE GAS made from calcium carbide is said to be taking the place of kerosene for house illumination in Germany.

THE first use of steam of which there is any record was for the production of a steam jet to increase the draught of a chimney.

A COLORADO sampler asking for \$10 a ton ore is the best kind of evidence of the reduction in treatment costs that improved methods are making.

GRINDING TOOLS are made in the United States with which grinding and shaping of metal can be done accurately to the thousandth part of an inch.

MOLYBDENITE, sulphide of molybdenum, is mined commercially in Chelan county, Washington. The consumption is increasing from new uses being developed.

THE great principles which make the metric system so desirable are the single unit for all measures of dimension and quantity and the use of only one divisor.

THE value of the coefficient C in the Chezy formula  $v = c \sqrt{r} s$ , employed to determine the velocity of discharge of water from a pipe of large diameter is 113.8.

THE record for high prices for oil land, if reports are true, is with the Beaumont field in Texas. One acre 300 feet from a gusher is said to have sold for \$25,000, spot cash.

THE discovery of diamonds in South Africa was made in March, 1867, by John O'Reilly, in the Hopeton district. The first diggings were in the bed of the Vaal river.

WASHOE COUNTY, NEVADA, the next door neighbor of the Comstock, expects to make for the first time this year a mineral output exceeding in value the agricultural.

A MINOR can locate a mining claim, but the right of the minor to make a valid conveyance of the location except by guardian has been questioned in litigation over oil lands.

THE mother lode in California was first known as the "Carson lode." It received this name from Carson Hill, in Calaveras county, where the croppings of the lode were very wide and extremely rich.

IN building a suspension bridge the floor is suspended so as to rise from the ends toward the center, this rise being called the camber of the bridge. For a 100-foot span 6 inches of camber will be sufficient.

BOULDERS OF ROCK, or float, containing valuable mineral, if the same exist in a tract of land in such quantities that the deposit is minable for the mineral, make a deposit which can be located and patented as a placer.

THE world's copper consumption in 1900 was 62,000 tons larger than in 1899. The production is estimated at 17,960 tons less than the consumption. The manufacture of sulphate of copper (blue vitriol) used 25,000 tons last year.

JUDGE NOYES at Nome, Alaska, has ruled that no one has a right to make a location until gold is discovered in the ground. The decision has given satisfaction to the miners and will put a check on the hatchet and pencil men.

FIREPROOF WOOD has been found in service to possess some disadvantages. The chemical salts forced into it tend to reduce its durability and strength, and in contact with iron or steel start an oxidation or corrosion of the metal.

THE local U. S. Land Office at Redding, Cal., recently made a decision holding the validity of a placer mining location for which U. S. patent was sought and dismissing a contest made on the ground that the land was more valuable for timber than for placer mining.

THIS PAPER has referred to the Steamboat Springs, in Washoe county, Nev., as an example of lode formation going on in sight. Lately, in sinking a well for hot water, the owners of the springs have discovered a lode carrying values that are considered sufficient to warrant further prospecting.

THERE are a number of blast furnaces making iron in Japan. No discoveries of deposits of what are known as Bessemer ores, ferro-manganese or chrome iron have been made in Japan. There is a possible market in that country for these ores to supply the raw material for steel making which the Japanese propose to engage in.

LESS than half a century has elapsed since mining engineering was considered a sort of side branch of civil engineering, and about the only branch that had an individual designation. Now the student may choose between civil, mechanical, mining, metallurgical, archi-

tectural, electrical, chemical, sanitary, military or naval engineering, each a profession requiring a higher intellectual capacity than all together did fifty years ago.

A HUNGARIAN RIFLE used in sluice boxes in placer mining is a cross rifle—that is, one in which the bars of wood or iron making the rifles are set transversely or crossways of the box. It is not necessary that the rifle bars should be at right angles; they may be diagonal or may be built in diamonds. The descriptive term covers all these forms of construction.

THE economical distribution of electrical power transmission is continually extending. In California two commercial installations are now operating, transmitting water power from the Sierra Nevada mountains over 160 miles to the cities around San Francisco bay. The electric equipment of the steam railway systems, inevitable in time, will add to this long-distance consumption of electrical power.

A USEFUL CEMENT for cast iron is made by mixing thoroughly in a mortar two ounces of sal-ammoniac, one ounce sulphur, and sixteen ounces of iron filings. Pending use, this mixture should be kept dry. When required to use, one part of this powder and twenty parts of iron filings are mixed thoroughly in a mortar and made into a paste with a little water, and is then ready to be used. A little fine grindstone sand improves it somewhat.

THE market for an ore containing some iron, nickel and cobalt along with over 60% of manganese is among the steel manufacturers. Manganese in this mineral form is used for making ferro-manganese as the intermediate product, subsequently used in making special brands of steel. The presence of the nickel might add to its availability. Samples of the mineral can be sent to the Illinois Steel Co. or the Bethlehem Steel Works.

THE lead-silver mines of western Greece and the Rio Tinto copper mines are probably the oldest working mines in the world. Both are known to have been worked several hundred years before the beginning of the present era, the lead mines 2500 years ago and the copper at least 2000 years. The Grecian mines still yield thousands of tons of lead annually, and the Rio Tinto is the third largest producer of copper in the world, being only exceeded by the Anaconda and Calumet & Hecla.

THE rate of setting of a cement increases with the fineness, the chemical reaction with the water taking place the more readily the finer the particles are. Coarse particles do not combine throughout, the water acting toward the fine particles just as if they were sand grains. In setting, the cement absorbs a definite equivalent of water, forming a true chemical combination, more or less crystallized in character. These crystals fill the spaces between the grains of sand and bind them together in the act of setting.

THE advance in the practical adapting of great metallurgical processes to minor utilities has been strikingly instanced in building the track of an electric street car line in the street in front of the office of this paper. The rail bond to make the return current circuit has been made by casting in the joints, the melted iron being provided by a small portable iron melting furnace mounted on wheels and moved by hand as required. The bonding thus made takes the place of copper wires requiring much more elaborate manipulation and cost to put in place.

THE Secretary of the Interior has recently ruled in a case coming from Colorado that work performed on a tunnel should apply on the regular assessment work. Under the ruling, it is said, the expenditure in one tunnel can be divided to cover the amount of assessment work on several lode claims. The decision of the Secretary reverses that of the Commissioner. It is hardly probable that the decision is as sweeping as the brief summary would indicate. Certainly the tunnel work must clearly be directed to the development of the claims that the expenditure is to be apportioned among.

THE commercial scaling of a log to determine the number of feet of 1-inch thick boards it will cut into is done by using any one of several rules. As good a one as any is to scale the small end of the log, taking its shortest diameter in inches. Subtract 4 inches from the scaled diameter and square the remainder. This product will be the number of feet of inch-thick boards in a log 16 feet long. For a log 24 feet long, add one-half; for 20 feet long, one-fourth; for 12 feet long, subtract one-fourth; for every 2 feet difference in length, add or subtract one-eighth to the number of feet calculated for a 16-foot log.

FOR assessment work the location is the unit that the laws consider. If a location is less than 1 acre, if it is 20 acres, or if it is the 160 acres maximum for placer locations, the requirement of annual assessment work is the same, \$100 on the location. If several contiguous locations are consolidated into one claim, work may be done on one for all, but in that case the sum of \$100 for each location must be expended in the assessment work. It is safer to perform the assessment work on each separate location. It eliminates a question fruitful of litigation, the question whether or not the work done on one location does as a fact develop the others.

GOLD and tin ore occur at Mount Cameron, near Gladstone, northeastern Tasmania. The mountain is composed of granite, crossed by dikes of porphyry, which is capped on the southern and northeastern flanks by metamorphic slate and sandstone schists. Several gold-bearing quartz veins have been discovered in the schists, not

far from the contact with the granite, a peculiarity of these veins being the resemblance of their filling to fine-grained gray to reddish quartzite. In the Royal Tasman vein the quartz became poorer in gold with depth, while cassiterite made its appearance, particles of gold and crystals of cassiterite being found close together. A remarkable association of tin sulphide and gold and silver minerals is also found in Bolivia.

THE seven cables of the Bay Counties Power Co. spanning Carquinez straits, Cal., 4427 feet between the towers, are each seven-eighths of an inch in diameter, made of nineteen wires, each one-eighth of an inch thick. The breaking strain of a cable is 96,000 pounds and the actual strain on it is 23,000 pounds, giving a safety factor of four. The cables sag 224 feet from the south tower and 146 feet from the north tower. The clear distance of the lowest point of the sag above high water is 208 feet. The cables are said to move less in a windy day than in a quiet one, the strain of the wind probably acting so as to destroy any vibratory movement in the cable, and equalizing to a steady pressure in the long line, there is no swinging. In high winds it has been noted that the cables become charged with static electricity from the friction of the moving air.

THE rulings of the U. S. Land Department have made marble locatable under the provisions of the Revised Statutes relating to placer claims. Another ruling of the department requires a discovery of the mineral (marble) on each 20-acre tract of a location. If the marble is a horizontally bedded deposit a placer location could be made with a little exploratory work to include 160 acres. If the deposit is narrower and dips beneath other rocks, a high authority on mining law states that properly the deposit should be located as a lode which would limit a claim to 1500 by 600 feet, or 20 acres. The Land Department, though later rulings say marble is placer, has accepted and patented limestone deposits as lodes. On what would be strictly speaking a ledge of marble neither lying nearly flat or nearly vertical, a locator might take it up both ways, as a placer and as a lode.

THE rim speed or rate of motion of the circumference of a water wheel of the Pelton type should be exactly one-half the velocity of the jet of water impelling the wheel. The velocity of the jet is taken as the spouting velocity of water through a circular opening in a thin plate multiplied by a fractional coefficient determined experimentally. With the rim speed exactly one-half of the velocity of the impelling water jet, action and reaction are equal. The water in doing its work loses half of its velocity, and the remainder of the velocity keeps the water even with the motion of the rim of the wheel till the two separate, the water by gravity, its force spent, dropping into the waste way. If the rim speed exceeds this half of the spouting velocity of the water, the wheel is racing, and it requires either less water or more load; if the rim speed is less than half the velocity, it requires more water or less load. In either case there is a loss of efficiency.

THE official call of the fourth annual session of the International Mining Congress at Boise, Idaho, July 23d, states the objects of the congress, among which are: "To secure better recognition of the mining industry by the National Government; to bring about needed changes in the Federal mining laws; to exchange practical ideas covering the various phases of the mining business and especially to take under advisement the importance of the creation by the Congress of the United States of a department to be known as the Department of Mines and Mining, thus securing a cabinet officer that represents an interest which affects more than one-third of the people of the United States, producing in 1900 over one billion of dollars." The basis of representation will be: The Governor of each State and Territory to name thirty delegates at large; the county commissioners of each county to name five delegates at large; the mayor of each city and town to name five delegates at large and one additional for each 10,000 population or fraction thereof; each mining bureau, each mining exchange, each real estate exchange, each chamber of commerce, each board of trade, each miners' union and each trade and labor union to name five delegates, and other commercial bodies to select a like number of delegates.

GOLD MINING AND MILLING costs are not always capable of direct comparison between different mines. In the mining, the size and pitch of the vein, the hardness of the rock, amount of water to be handled, the nature of the power and machinery employed, involve in different mines unavoidable influences in costs of extraction and delivery at the reduction works. In the milling, the hardness of the ore, the fineness of the crushing, quantity and character of the sulphurets that must be concentrated, source of power employed, are another set of conditions making unavoidable differences in costs. Sometimes these differences balance off in the aggregate, more often their effect cumulates the total difference. While it is desirable to take as a standard the cheapest successful mining and milling, expectations of profit in new enterprises should not be based on realizing it. It is quite a fad with prospectus writers to use the extremely low cost charges obtained under exceptional conditions, after years of experiment and improvement, to demonstrate the desirability of the new enterprise they offer. The facts are, however, against these figures. The conditions are never the same and even the best that can be done with mining and milling in any mine is only learned after doing a great deal of it with that mine.

## Pneumatic Processes for Leaching and Cyaniding.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OBYL.

These two processes, known respectively as the pneumatic process for the lixiviation of copper ores and the pneumatic cyanide process, both of which are covered by patents, are worthy of the most intimate consideration and study, since they introduce an element into the extraction of copper and gold values from their respective ores which is of the greatest import as to the increased output effected thereby and the reduction of the time employed in the usual leaching operations effected by means of sulphuric acid or cyanide. They are based upon the principle that the air contained in the solvents employed is not present in quantities sufficient to support and maintain the oxidation process ensuing, and that the oxygen required must, therefore, be applied from the outside in a mechanical manner, so as to render the dissolving reaction a continuous one and to assure a complete extraction of the values present. This purpose is accomplished not only by the introduction of perforated pipes, which send a steady current of air bubbles through the liquid, but also by applying heated and compressed air, when the increased affinity and the agitation produced thereby cause a more intimate contact of the gold, silver or copper atoms with the solvent, while the presence of free oxygen enhances the formation of the metallic solution to a remarkable degree. When applying the pneumatic cyanide process the perforated pipes, mentioned above, are made of iron throughout, as potassium cyanide in aqueous solution does not affect them, while in the pneumatic process for the extraction of copper ores these conduits are constructed for the main part of iron, and only so far of lead as they are immersed in the dilute sulphuric acid or other solvents attacking iron.

Besides these points, however, another principle of physics, bearing upon the pneumatic processes, is to be taken into consideration, for it is well known that on conducting air into water and expelling the former by boiling the original proportion by volume of oxygen to the nitrogen, as contained in air, which is 21 to 79, respectively, undergoes a remarkable change, since the oxygen contents are materially increased thereby. This circumstance is readily explained by the greater solubility of oxygen in water in comparison to that of nitrogen, so that the air expelled from that liquid consists of 34.9 volumes of oxygen and 65.1 volumes of nitrogen. (Bunsen.) On the other hand, water saturated with air or aerated water, as it is always found in nature, contains by the short ton or 34 cubic feet but  $\frac{1}{2}$  cubic foot of oxygen, weighing 141 grains, or nearly  $\frac{1}{2}$  ounce avoirdupois, and  $\frac{1}{2}$  cubic foot of nitrogen, weighing 249 grains, or about  $\frac{1}{2}$  ounce—a quantity which must necessarily appear as quite insufficient for "maintaining" the dissolving process carried on either in the presence of cyanide solution or sulphuric acid. These points will gain considerably in clearness by considering the relative chemical formulæ representing the processes to which we have reference, when it will be seen that 158.6 parts by weight of chalcocite require 128 parts of oxygen for complete solution, while gold and silver, which are both saved in the cyanide process, require one atom of oxygen for every atom of the two precious metals for perfect extraction.

It is also evident from this equation that the complete decomposition and oxidation of chalcocite is accompanied by the regeneration of the original weight of the sulphuric acid added, and it is known that a result approaching these conditions can be reached by applying cold, heated or compressed air as a promotive medium in the lixiviation of gold, silver or copper ores. The equation representing the reaction occurring as to the two first named minerals is generally given in the following form, and is known as Elsner's equation, the latter chemist having first advanced it as given below, and called special attention to the necessity of oxygen being present in abundance:

Identical with this equation is that given for silver, inasmuch as that metal forms also a double salt of silver and potassium cyanide, analogous in composition to that of gold, as shown below, both metals being recovered from the solution when passing the zinc shavings in the precipitation boxes, whence they are removed to be subjected to the fluxing process usually employed for the reduction of bullion:

These points having become clear, it will be seen

from the following representation of the reaction ensuing on subjecting chalcocite or speckled copper ore of the composition of  $\text{CuFeS}_2$  to leaching with sulphuric acid that the same weight of oxygen is required for producing complete oxidation and solution as in the case of chalcocite, while the iron and sulphur present absorb four molecules of oxygen to be transformed into ferrous sulphate and sulphuric acid, respectively. This view of the reaction is undoubtedly the correct one, if we bear in mind that the molecule of sulphuric acid added selects the copper of the mineral for its base exclusively, and combines with it to form copper sulphate—a procedure which is most likely to ensue. We assume, of course, that the ores to be treated in these cases are concentrates, relatively free from foreign admixtures, and have not been subjected to a previous roast, as is actually done in many lixiviating works. Whenever it is intended to leach the ores under these conditions, however—and it seems that modern methods naturally aim at the simplification of the operation as far as possible—the employment of the pneumatic process becomes of vital importance, since, without it, the leaching of the ore must necessarily absorb a great amount of time, and become very tedious on account of the absence of the oxygen required for perfect solution. The respective chemical equation in the case under consideration is as follows:

and it will be seen that in this instance 128 parts by weight of oxygen are required for bringing 183.3 parts of chalcocopyrite into solution, and that one-half the weight of sulphuric acid suffices for this purpose in comparison to the weight of acid employed for the leaching of chalcocite. On the other hand, two molecules of sulphuric acid are reproduced in the case of chalcocite (Equation I), while only one molecule of that acid results on treating chalcocopyrite.

If we consider, now, in comparison with the points given above, the reaction ensuing with roasted chalcocite, and assume that the roasting has been carried out to perfection, so as to change all the sulphide present into oxide, the equation representing the leaching process will be as follows:

On examining this reaction more closely it will be seen at once that under existing conditions no addition of oxygen is required. The question, therefore, resolves itself into the consideration, what copper concerns, whether the roasting or the pneumatic addition of oxygen can be effected at less expense. We are inclined to say that of these two methods the pneumatic process deserves preference, since the roasting of chalcocite or chalcocopyrite requires a continuous and hence large supply of fuel, representing a prohibitive factor for many localities, while the pneumatic procedure can be applied either without heating the air conducted into the liquid, or by warming it by means of an oven through which the air passes before entering the conduits. Even if compressed air is employed—a certain pressure being required in all cases—for the production of which appropriate machinery is required, the initial outlay caused by the construction of a plant of this character remains far below the cost incurred by the erection of a roasting furnace, which is not only a costly structure from the beginning, but also an expensive one to maintain on account of the frequent and unavoidable repairs occurring.

Time is considered as being equal to money by business men, and the majority of mechanics are paid by the hour, so that the financial point in the case under discussion represents a momentum of vital importance. It is stated, therefore, that the thorough lixiviation of a certain weight of ore is effected in twenty-four hours, and that the same result can be reached, when applying the pneumatic method, in less than half the time, the importance of the process becomes very striking and evident. In favorable cases this time is even reduced to ten, eight and six hours for complete extraction, since the excess of the free oxygen present contributes remarkably to the speediness of solution. This observation refers to copper as well as to gold and silver ores, and is supported by practical and scientific facts, which cannot be disputed.

Modern methods aim at perfection, at the avoidance of all losses, at the utilization of all by-products, and the complete extraction of values by lixiviating or cyaniding processes, and it must be well understood that none of them answers its purpose entirely as long as these points are not approximately reached. Such results are seldom accomplished from the beginning, and it is only by continuous study and observations, and the contributions of many, that a process is finally brought to that degree of perfection which is so essential for its application. The two pneumatic processes under discussion are, therefore, to be considered as most valuable additions to

the knowledge already acquired, and the time will not be far distant when the producer of one or the other of the metals mentioned will not be satisfied until he has managed to add these great saving appliances to the existing machinery and implements of his plant.

**OTHER ECONOMIC PROCESSES.**—If we now extend our researches to the behavior of the most abundantly occurring copper ore—namely, chalcocopyrite—and assume that this mineral was subjected to a "dead" roast, that is, to complete decomposition and oxidation, and the expulsion of the acids present, as shown by the equations VI, VII and VIII, it will become evident that but one molecule of sulphuric acid is required subsequently for the transformation of the cupric oxide produced into sulphate (equation V), since the ferric oxide present is not affected in the cold by dilute sulphuric acid, and is, therefore, successfully eliminated in this manner.

Results of light oxidizing roast:

Results of dead or decomposing roast:

The question of economy enters naturally into all mining operations as an essential factor, and the wasting of any by-product must necessarily appear as a defect in the process applied. It will be seen from equations VII and VIII that on roasting chalcocopyrite to complete decomposition a great amount of sulphurous and sulphuric fumes are produced, which are generally allowed to escape into the atmosphere and thus go to waste. The loss ensuing in this manner might be readily avoided by conducting the acid vapors into vats containing the subdivided and previously roasted ore, besides the necessary amount of water, when the sulphurous and sulphuric acids thus formed will effect the solution of the cupric acid. The behavior of sulphurous acid, when obtained in this or the manner indicated below, will become apparent from the following considerations.

If sulphur dioxide only is produced by burning chalcocopyrite on properly constructed grates, the gas evolved by the co-operation of atmospheric oxygen, admitted in abundance, consists practically of sulphur dioxide alone:

This gas may be utilized either in the manner described before—that is, by conducting it into the vats filled with the crushed ore and water—or it may be introduced into the latter alone. Assuming the first mentioned method having been chosen, the metallic solution resulting will contain, besides the cupric salt produced, a certain amount of cuprous sulphite of the formula  $\text{Cu}_2\text{SO}_3 \cdot \text{HO}_2$ , which represents a substitution product of sulphurous acid, two monovalent copper atoms having replaced two hydrogen atoms in the latter:

In the second case under consideration—that is, on introducing the sulphur dioxide produced into water—sulphurous acid will be formed exclusively, which, however, decomposes, when in contact with air, and especially if exposed to sunlight, into sulphuric acid and free sulphur:

Since the latter settles in the bottom of the vat employed in a finely divided condition, it represents a by-product of appreciable value, fit for medicinal purposes, if washed and dried in the proper manner. The supernatant liquid, which is drawn off into another tank, consists of a dilute solution of sulphuric acid only, which is applied for the lixiviation of the cupric oxide produced.

If we calculate, now, the amount of sulphurous acid obtainable from a ton of chalcocopyrite by burning the mineral on grates and conducting the fumes into water, we will find from equation IX by introducing the atomic weights:

and the proportion

$$366.6 : 256 :: 2000 : x \\ x = 1396$$

that 1396 pounds of sulphur dioxide can be produced, according to theory, from a ton of chalcocopyrite. Since it is known, however, that the latter mineral, when subjected to burning, retains a certain percentage of sulphur at the temperature prevailing in the furnace, we will figure on the conservative estimate of 1000 pounds of sulphur dioxide per ton of

## Electric Locomotives.

The coal operator who opened his mine but a few years ago, and employed mules for hauling his coal, soon found that some quicker means was necessary for delivering coal to the tippie. The convenience and simplicity of electric haulage was early recognized, and the increasing demand for electric locomotives is ample evidence that they have met every requirement of the mine. The necessity for locomotives of large capacity has grown with the output of the mine, but the original low and narrow entries have proved a serious obstacle to their use.

To meet the demand for a locomotive of large hauling capacity, and yet of so compact a form that it can be used in the average entry, the Jeffrey Mfg. Co., Columbus, Ohio, has brought out among its later designs the twenty-ton locomotive shown in the illustration, which the makers say is one of the largest yet built for mine use.

The manufacturers claim that the rated draw bar pull of this locomotive is 8000 pounds and that under test the locomotive developed over 11,000 pounds draw bar pull before the wheels slipped. The speed dependent on load ranges from 6 to 10 miles an hour, and the motors are of ample capacity to skid the wheels on the best track when using sand.

It is equipped with three 60 H. P. motors, each geared to an independent axle and pair of drivers. The drive wheels are pressed on and keyed to special, hammered, open-hearth steel axles. The wheels themselves are of the open-plate cast-iron type with chilled tread. The axle journal bearings are made of a very tough and durable bearing metal, and are of sufficient size to make the pressure on the journals well within the safe limit. The wheels being inside the locomotive frame, the axle journal bearings are accessible for oiling, or for renewing the linings.

The frame of the locomotive is of massive iron castings rigidly bolted together with heavy steel bolts, and supported by equalizing leaf springs, which rest in suitable chairs on the journal boxes. The frame covers are of sheet iron hinged so as to allow easy access to all interior parts of the locomotive.

The brake mechanism is very simple but effective. Pressure on the six brake shoes is equalized by a system of levers. The brakes are operated by a screw which is keyed into the hub of the hand wheel.

Twenty-Ton Electric Mine Locomotive.

No ratchets and pawls are necessary for locking this brake mechanism, as the screw makes it self-locking in any position. Sand boxes of large capacity are provided at both ends of the locomotive, and operating levers for them are placed within convenient reach of the operator.

The motors are water and dust proof. They are wound for either 220 or 500 volts. The motor frames are of cast steel. The armature shafts are made of high-grade crucible steel and bearings for both are made of the best bearing bronze obtainable, carefully bored to alignment and scraped to fit before assembling. The commutator is made of drop forged copper segments, insulated with mica.

The controller used on the locomotive is the Jeffrey Class 9. It has specially large, milled contacts, and is so arranged that the motors may be run either in series or in parallel. The resistance coils, of ample capacity, are at the top of the locomotive, and so arranged that there is a constant circulation of cool air about them. On either side of the locomotive frame is a cored receptacle for the Jeffrey Standard trolley base, which admits of the trolley pole being placed to suit the mine wiring.

Every motor used on the Jeffrey locomotives is given a full load and overload test before placing on the locomotive. After the locomotive is complete it is placed in a special testing frame and made to run the equivalent of several miles under load in both directions.

A NEW geyser has appeared near Lake Echo, Romtomahana, N. Z. It is described as a mass of boiling water, half an acre in extent, lifting in a great dome, through which a column of steam, water and stone rises 300 feet.

## Power Transmission from Niagara Falls.

There are three separate transmission circuits from the Niagara power house to Buffalo, two of which are copper, and installed on the same pole line. The third circuit is strung upon a separate pole line throughout its entire length, and is of aluminum instead of copper. This aluminum line has the same resistance as each of the other two, and is composed of three cables of 500,000 circular mils each, made up of thirty-seven strands. At the present market price of copper wire it is cheaper to use aluminum for overhead lines where the conductors do not have to be insulated. The conductivity of aluminum is less than copper, and the price per pound is greater, but the volume per pound of aluminum is much greater than that of copper on account of the lower specific gravity of the metal. When, therefore, resistance per pound is taken as the basis for comparison, aluminum is found to be cheaper.

Since the long-distance service to Buffalo was started in 1896, the line has been operated at a potential of 11,000 volts; but recently the voltage has been raised to 22,000, and the capacity of the three Buffalo circuits is now 30,000 H. P., with about 10% line loss. No power is taken from the Buffalo transmission line until North Tonawanda is reached—a distance of about 10 miles—where the Tonawanda Power Company at present utilizes about 1000 H. P.

At the point where the Buffalo transmission line is tapped with supply lines for the Tonawanda sub-station the transmission line which supplies the city of Lockport with electric power is also connected. This branch line, consequently, has the same voltage, phase and frequency as the Buffalo line. Its length is about 15 miles, making the Lockport sub-stations about 25 miles from Niagara Falls. Three hundred H. P. is used by the local electric lighting company in motor generator sets, and about 600 H. P. in a rotary converter sub-station which supplies power for local electric railroad service. It is from this sub-station that the forty-ton electric locomotives are operated which daily haul heavy freight trains on this feeder to the Erie railroad, hauling at times as many as twenty-eight loaded freight cars. Since the sub-station feeds direct current for a distance of 10 miles beyond the sub-station, on certain sections of this route the locomotives receive their power at

## A Slow-Speed Mill.

The old, slow-working arrastra, used for crushing ore, is claimed by some mill men to be a better amalgamator than the modern stamp mill. There have been many mills built of the type of this old mill, but they have usually been fast-speed mills, running at thirty to eighty revolutions. The Lane slow-speed

The Lane Slow-Speed Roller Mill.

roller mill, a cut of which is shown, is one of the latest roller mills. It is a slow-speed mill, making twelve revolutions per minute. It amalgamates, so its manufacturers say, as well as an arrastra, and from 10% to 20% better than stamps. Its capacity is greater than that of stamps of equal cost.

The particular advantages claimed for the Lane mill by its manufacturers are the saving of a greater amount of the gold at a less expense for running and repairs, and at smaller original cost than a stamp mill of equal capacity. A 7-foot Lane mill costs less than a 5-stamp mill does, and will do work of ten stamps and much better amalgamating. It weighs less, which means a saving in freight, and can be set up for less, because it requires less grading and foundation work. Ordinarily it is run as a plain rolling mill, crushing to any desired mesh. If very fine pulp is required, it can be changed into a roller-grinding mill to crush as fine as 150 mesh. The inside of the screens can be brushed while the mill is running, and leaves, roots and chips can be removed with the hand. The space of screens in the 7-foot mill is 50 inches. The 5-foot mill is in general construction the same as the 7-foot mill, which is described in detail, but is, of course, lighter in many of its parts.

## Recent Additions to Museum California State Mining Bureau.

Selenite crystals from geodes, Wayne Co., Utah. Curiously marked argillaceous sandstone, called "town plat rock," Glen canyon, Arizona.

Auriferous volcanic tufa, Bishop Creek, Inyo Co., Cal.; Thos. Rigg.

Platinum and associate minerals, Happy Camp, Siskiyou Co., Cal.; O. C. Pope.

Rich gold quartz, Jumper mine, Tuolumne Co., Cal.; P. Geo. Gow, manager.

Hydrophane (variety of opal), a peculiar mineral which becomes translucent when soaked in water, Riverside, Cal.

"Stream tin" (oxide of tin), Dominion creek (Klondike), Yukon Territory; Arthur Bolton.

Cinnabar, recent discovery at Terlingua, Brewster Co., Texas; Judge M. H. Hyland.

Cinnabar, crystals on crystallized pyrite, H. & N. mine, Stanislaus Co., Cal.; E. P. Newhall.

Gold quartz showing free gold, Oregon & California mine, Siskiyou Co., Cal., and Gold King mine, Shasta Co., Cal.

Gold quartz showing free gold in talc, Gold Hill mine, Kelsey, El Dorado Co., Cal.; T. D. Manson.

Auriferous "ruby sand," beach at Nome City, Alaska; P. L. Wooster.

Nickel ore from Sudbury nickel mines, Canada.

Koppite (pyroniobate of cerium calcium, etc.), with magnesio-ferrite in limestone, Schelingen, Baden, Germany.

Perthite, a variety of feldspar consisting of orthoclase and albite.

Scapolite, three specimens finely crystallized, Canada.

Zircons, Zirconia, North Carolina.

Sodalite, apatite, celestite, chrysotile, arsenopyrite, actinolite, corundum, muscovite, etc., etc., Canadian localities. HENRY S. DURDEN, Curator.

U. S. CONSUL F. H. MASON reports to the State Department a great improvement in Welsbach gas-lights made by R. Langhans, an Austrian engineer, resident at Berlin, who has discovered and perfected a chemical complex, which, added to the thoria-ceria mantle, converts it from a loose structure hardly sustaining its own weight into an elastic glass, chemically combining the constituents. The mantle is made not only stronger, but it holds the ceria to its work, maintaining the constancy of the light emission and resists the shrinkage tendency of the thoria.

a distance of 35 miles from the Niagara power house. This is a forcible illustration of what can be accomplished by the application of electrical power to steam railroad service.—H. W. Buck in Cassier's Magazine for May.

THE Government of British Columbia is said to have made arrangements with the Con. Cariboo H. M. Co. to forward to Glasgow models of the gold bars made from the 1900 clean-ups of the mine at Bullion, and in addition an actual block of solid gold, to weigh in the neighborhood of half a ton, which will be the first clean-up of this season's operations at the mine. The expense to which the Province will be put in the matter is cost of transportation and insurance from either New York or Montreal to destination. The appearance of this ingot at Glasgow cannot fail to attract a great deal of attention, and no better way of advertising the mineral wealth of British Columbia could be possibly devised.

A RUSSIAN GOVERNMENT expert, who has investigated the fatigue of the eyes by light, says the involuntary closing of the eye (winking) is a sign of weariness. Using surfaces illuminated by various lights, he counted the involuntary movements of the eyelid, his results being that, when candle-light was used, the eyes were closed 6.8 times a minute; with gas-light, winking occurred 2.8 times a minute; with sunlight the eyes closed 2.2 times, and with electric light 1.8 times. From these facts he draws the conclusion, which seems to be corroborated by other observations, that the electric light is the least injurious to the eyesight of all varieties of artificial illuminants.

# Mining and Metallurgical Patents.

Patents Issued April 16, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 671,970; H. Koch, Tarrytown, N. Y.

Combination with cylinder, piston, distributing slide valve, and valve operating mechanism, which operates the valve at certain points in stroke of piston, but leaves valve free to move at other periods in operation, of means for holding valve against movement, due to its weight, when drill is pointing downwardly and the valve is not held or positively actuated by valve operating mechanism but whereby valve is free to move by its own weight when drill is pointing upwardly and valve is not held or positively actuated by its operating mechanism.

ROCK DRILL.—No. 672,083; L. T. Sicka, Denver, Colo.

The combination of inclosing case, shaft journaled in one end, crosshead mounted to slide in case, and connected by link to crank on shaft, a U-shaped spring secured to crosshead and extending lengthwise within case, plunger rod mounted to slide within case lengthwise of and with ends between arms of spring, swiveled collar encircling neck of rod so as to permit it to rotate, and a pivoted link connection between collar and free end of spring arms.

ELECTRIC CRUCIBLE FURNACE.—No. 672,054; G. de Chalmot, Holcombs Rock, Va.

A furnace body or shell forming chamber within it, crucible suspended within chamber, the chamber being materially larger than crucible to form a heat in-

sulating space around latter, a carbon support for crucible making circuit connection therewith, support connected to one terminal of circuit, and a carbon electrode contact with lower part of crucible and connected to other terminal of circuit and movable so that it may be fed toward crucible as it is consumed.

MINING DREDGE.—No. 672,072; W. T. Urie, Kansas City, Mo.

A dredge boat, and dredging devices upon forward end of boat, and boat-anchoring spud at rear end of dredge boat having a sheave at upper end, guide boxes for spud connected with rear end of boat, braces extending horizontally from rear end, and inclined at angle to sides of boat, and toward each other, and having sheave in ends, means for raising and lowering spud, and winch upon boat, and cable connected with lower end of spud and extending over the sheaves upon braces, and upper end of spud, and also connected with winch.

TROUGH CONCENTRATOR.—No. 672,298; C. A. Taylor, Leadville, Colo.

A table, series of troughs on table, each trough having side plates perpendicular to table, the side plates of each trough being relatively parallel at plurality of points throughout length of table, whereby space between such plates is greater at one end of the table than at other, outlet openings being formed in each trough between several adjoining parallel portions of side plates.

MEANS FOR COOLING ORES FROM ROASTING FURNACES.—No. 672,373; J. Jacobs, Florence, Colo.

A car adapted for reception of ore, series of cooling pipes located within body of car and so arranged that cooling medium passes first through bottom pipes and thence upward to top of car, and means

for temporarily connecting pipes with a source of fluid supply.

APPARATUS FOR OXIDIZING ORE.—No. 672,065; H. C. Lawrence, Denver, Colo.

A water-jacketed precipitating chamber, hollow shelves provided with circulating plates mounted in chamber communicating with water-jacket and arranged to provide circuitous passage for vapors and gases through chamber, doors to chamber for removal of precipitated products from shelves, a chute mounted on outer wall of chamber for conveying removed product to suitable receptacle and valved pipes communicating with water-jacket.

IMPACT WATER WHEEL.—No. 672,315; W. A. Doble, San Francisco, Cal.

A composite wheel, consisting of nave of cast metal, and successive cast metal rings, one or more, secured to nave and to each other by bolts or equivalent fastenings, rings being made of metal of different degrees of tensile strength, progressing outwardly, to provide against progressively increasing strain from nave outward due to centrifugal action.

METHOD OF TREATMENT OF AMALGAM CONTAINING COPPER OR PRECIOUS METALS.—No. 671,988; J. H. Burfeind, Salt Lake City, Utah.

The method of treating amalgams containing copper and precious metals, which consists in adding sulphur to amalgam at temperature not exceeding boiling point of water, and separating from amalgam the copper sulphide formed.

## Stream Tin in Alaska.

Stream tin is found in considerable quantities on Buhner creek, which enters the Anakovik river from the west side, about 3 miles from Behring sea. The occurrence is perhaps best located by stating that it lies some 10 miles east of Cape Prince of Wales, and hence very near the northwestern extremity of the continent. The stream tin is concentrated on the bedrock with other heavy materials and was found by the miners in the sluice boxes. A sample of the concentrate in one of the sluice boxes was examined and yielded the following minerals: Cassiterite, magnetite, ilmenite, limonite, pyrite, fluorite, garnets and gold. The determination of percentage by weight was as follows: Tinstone, 95%; magnetite, 5%; other minerals, 5%. The cassiterite occurs in grains and pebbles, from the microscopic in size to those half an inch in diameter; they have half-round and rounded forms. In some cases there is a suggestion of pyramidal and prismatic crystal forms. The cassiterite varies from a light brown color to a lustrous black.

A second locality of this mineral was found on the Anakovik river, half a mile below the mouth of Buhner creek. Here the cassiterite is also found with the concentrates from the sluice boxes of miners. I observed one specimen from this locality which was some 2 inches in diameter.—Alfred H. Brooks, in Science.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

A glacier is reported to be forming on the mountain back of Dawson. The ice is 12 to 15 feet thick and is making part of the town uninhabitable.

J. J. Habecker, manager of the Philadelphia Crude Ore Co., states that his people will mine crude sulphur from the crater of Mount Makushim, an extinct volcano on Unalaska island. Beds of sulphur are found at the crater of the volcano, 200,000 tons being said to be exposed in one part where hot vapors have melted the snow. It is proposed to build 20 miles of railroad from the seashore to the base of the mountain. Surveys were made last summer. Manager Habecker proposes to send a party to the mine about July 1st.

The Philadelphia M. Co., at Rampart City, Erastus Brainerd manager, is operating on Idaho bar, using machinery and a big force of men.

Quartz mining at Rampart City is beginning to receive attention. J. Langford and his partner have discovered a big ledge on Mike Hess creek. Assays show gold in paying quantities. The ledge has been traced and located a long distance. Present indications are that a stamp mill will be erected near Rampart City.

The Treasury Department at Washington is considering the appointment of D. B. Harrison of Illinois as collector of customs at Sitka, to succeed J. W. Ivey.

The Gladhouse mine on Virgin bay, bonded for \$60,000 by J. J. Maanach, has been developed by him. A smelter shipment, taken out of the ledge below high water line, netted about \$30 per ton. A shaft has been put down 120 feet and the ledge cut by a drift from the bottom at 114 feet. It is expected the ore will run between \$40 and \$50 per ton. About 500 tons of ore are to be shipped at once.

## ARIZONA.

### GILA COUNTY.

J. A. Fleming, Pres. Black Warrior C. Co. of Globe, states that the mine will soon begin operations, handling 300 tons of ore daily. The plant consists of a leacher of 125 tons capacity, a smelter, a refinery and an acid plant.

### YAVAPAI COUNTY.

E. W. Wells and W. C. Parsons of Prescott and H. McCrum of San Francisco are reported to have sold the McCabe mine at Prescott to Chicago people, F. Jager being the head of the new organization, who announces that new machinery will be bought immediately and the shaft sunk to 1500 feet. They also propose to build a smelter.

## CALIFORNIA.

### AMADOR COUNTY.

The Particelli mine, near Irishtown, has been bonded by J. E. Dye and associates of Jackson, who propose to begin work on it immediately. They will reopen one of the old tunnels, put on a steam hoist and sink a shaft, and will put up a mill.

L. Cassinelli of Volcano has bought the Griesbach & Mason quartz claim in Pioneer district.

### BUTTE COUNTY.

The Oroville Gold Dredging & Exploration Co. has incorporated in Arizona, capital stock \$500,000, to mine for gold by dredging at Oroville.

### CALAVERAS COUNTY.

A rich quartz strike has been made near Mokelumne Hill. The ledge, a blind one, is about 3 feet in width and carries specimen rock. The locality, French Hill, in early days was a rich placer, and it is believed that the feeder to these gravel deposits has been found in this ledge.

The Phoenix M. Co. has bought the Merrimac gravel mine at Central Hill, near San Andreas, and have put nine men at work on it.

The Salvator G. M. & M. Co. has incorporated to mine in Calaveras county. The directors are H. C. Newman, San Francisco; F. Largomarsino, Mokelumne Hill; W. C. Ramsey, F. R. Clark, H. M. Lander, P. Taglio, O. B. Parkinson, Stockton.

It is said that the expert who examined the copper mines about Copperopolis has made a favorable report and that the Ames estate and other owners will at once start development work on a large scale.

Official reports of the Gwin Mine Development Co. for the year just past say that, though nearly 100,000 tons of ore were extracted, the shaft being no deeper, the estimates of ore reserves show 330,000 tons of ore above the 1600-foot—or lowest—level, compared with 311,500 tons a year ago, due chiefly to the unusually large development of ore on the 1600-foot level, the grade of which, thus far worked, has

not averaged less than \$5 per ton. The production of the mine during the present company's ownership has been to April 1, 1900, 171,748 tons of ore, which yielded \$702,003.81, and from April 1, 1900, to April 1, 1901, 99,211 tons, which yielded \$419,421.48, a total of 270,959 tons, which yielded \$1,121,425.29. The gross profits of the year were \$151,749.19, from which \$120,000 was paid in dividends. The old board of directors was re-elected, with F. F. Thomas president and general manager, C. S. Benedict vice-president, D. McClure superintendent and J. J. Crawford secretary.

### EL DORADO COUNTY.

S. C. Jordan of Dutch Flat, Placer county, has bonded the Clipper quartz mine at Georgetown.

At the Ford mine and vicinity, Georgetown, a deposit of rich copper ore is attracting much attention, and many claims are being located. Several transfers are said to have been made.

J. Richards is prospecting the Crown Point mine, Placerville. There is a shaft 500 feet deep on the mine.

Work has been commenced on a quartz ledge on the ranch of O. E. Hughes of Sacramento near Pleasant Valley, El Dorado county. Ore taken from it assayed \$17 a ton.

### FRESNO COUNTY.

Powell Bros.' copper mine, near Doyle's, is reported to show up very rich. The rock can be packed out and hauled to the railroad at Porterville for \$10 a ton.

### KERN COUNTY.

The 100-stamp mill of the Yellow Aster M. Co. has been started. The mill crushes 450 tons daily.

### MENDOCINO COUNTY.

The Mendocino Electric Quicksilver M. Co. has incorporated at Cloverdale to work a quicksilver deposit near Hopland. The deposit is a large body of yellow ochre, rich in cinabar. The company intends to have a furnace at the mine and to begin tunneling shortly.

### MONO COUNTY.

The Sweetwater M. & M. Co., J. J. Phelan one of the principal stockholders, has bonded the Sayre mine, near Sweetwater. A contract is to be let to build a road to the mine.

The Southern Con. M. Co. has incorporated to mine the Noonday group at Bodie. J. B. Haggin, Hearst estate, J. S. Cain, A. J. McCone, W. H. Metson and J. W. Kelly are stockholders. Hoisting works will be put on the Red Cloud shaft.

### NAPA COUNTY.

The D. Patten & Co.'s Silverado mine at Calistoga is shipping ten tons of ore daily to the smelter.

### NEVADA COUNTY.

The Lamarque Con. mine at Grass Valley has been bonded to E. J. Caldwell and C. T. Seitz of San Francisco. They propose to put in new machinery and to sink the incline now down 300 feet deeper. The mine adjoins the North Star.—The Iron gold mine, near Newtown, has been bonded by E. Hooper and Williams Bros. of Grass Valley, who have commenced work reopening it.

A strike has been made by Buck Bros. of Moore's Flat in a claim near the Plumbago mine. They have taken out by a hand mortar several thousand dollars. They state that it is their intention to erect a 5-stamp mill on the property this summer.

### PLACER COUNTY.

The Pioneer-Lynn G. M. Co. at Towles are stated to be preparing to add additional stamps to the mill. J. Sullivan is Supt.

### PLUMAS COUNTY.

The Ingalls mine in Light's canyon is said to be sold to an English syndicate for \$350,000.

The Glazier drift mine, on the north fork of Feather river, is reported to have been bought by J. H. Weber and associates for \$10,000 and some stock. The mine is on a gravel channel running through Oak Flat which has yielded considerable gold.

It is said the Plumas-Eureka at Johnsville will be started up this summer and employ about twenty men. The mine has been leased to J. O'Brien and others. W. Metcalf will be Supt.

### SHASTA COUNTY.

Charles Butters has located a claim to 50,000 inches of flow of the Sacramento river at Tunnel No. 3.

The Mountain Copper Co., Ltd., at Keswick, in their report for 1900, give the following figures: Ore extracted—1897, 165,060 tons; 1898, 221,895; 1899, 203,965; 1900, 179,694. Ore smelted—1897, 97,185 tons; 1898, 168,514; 1899, 176,689; 1900, 207,571. Copper (in matte form) produced at Keswick—1897, 7238 tons; 1898, 10,721; 1899, 10,664; 1900, 11,978. Copper produced at New Jersey Refining Works—1897, 5958 tons; 1898, 8273; 1899, 11,388;

1900, 11,443. Copper sold—1897, 6025 tons; 1898, 8273; 1899, 9647; 1900, 10,558. The report says about one-half of the property still remains to be explored, and it is estimated that (including the stocks on the surface and in process) about 1,000,000 tons of ore, likely to average about the same value as that already dealt with, is still in sight. The net profits for the year were £300,269 (about \$1,500,000).

The Clover Creek Cinnabar Co., mining for quicksilver near Millville, has contracted with J. Werne and W. Morgan to run a tunnel 300 feet in length to crosscut the ore body at a depth of from 250 to 300 feet. The ore is estimated to contain from 3% to 5% quicksilver.

The Miller mill and mining property, between Redding and Middle Creek, has been sold by the Gold Reward M. Co. to the Crown Deep M. Co. The property consists of eight mining claims, the Miller's Custom Mill and the Charley Zenser Ditch.—The Trinity Copper Co. have bought the Ridge, Motion Creek, United, River and Wash Boulder placer mines, in Flat Creek mining district, the purchase price being said to be about \$5000.—A rich strike is reported in the Except mine, on Clear creek, near French Gulch. It is said a tunnel is being driven in on a 5-foot ledge which carries rich values in free gold.

The Highland mine, near French Gulch, is to be reopened. M. C. Peck has bonded it and will put men on cleaning out old workings and developing.

The Phoenix mine has been bonded by C. Watson of French Gulch and W. D. Watson of Redding for six months. An engine, pumping and hoisting machinery are to be put in and a shaft sunk.

### SIERRA COUNTY.

A rich strike in the Golden Era quartz mine at Sierra City is reported by the owner, T. Murphy.

### SISKIYOU COUNTY.

Coal and asphaltum are found at points in Shasta valley and in the Siskiyou mountains. There is coal close to Yreka and also at Willow creek, 10 miles north. It also exists near Siskiyou, where C. Dollard made considerable development some years ago.

The Black Bear mine at Black Bear, it is said, will be reopened on a large scale.

### SONOMA COUNTY.

At the Culver & Boer quicksilver mine, near Cloverdale, the tunnel has been advanced to 540 feet. The 1900 product was 106 flasks.

### TRINITY COUNTY.

A wagon road is proposed from Delta, on the railroad in Shasta county, to Trinity Center. The distance is 10 miles and the estimated cost \$20,000. It is believed the road would reduce cost of transporting ore from \$20 a ton to \$8 a ton, and in addition would open up a timber belt in western Shasta.

### TUOLUMNE COUNTY.

The Riverside mine is being reopened by San Francisco people, C. G. Grim Supt. The company proposes, after some additional development work, to enlarge the mill from ten to forty stamps and add a cyanide plant to it.

A rich pocket, estimated to contain from \$30,000 to \$50,000, is reported struck in the Mountain Lily mine, Columbia. For some time the miners had been working through extremely rich ore before the pocket was cut.

The Dutch is in bonanza on the 1200 level. The shoot shows 15 feet width.

### YUBA COUNTY.

The Cabbage Patch mine, near Smartsville, has been bonded by W. Billings, E. Roberts, R. Quick, W. Foote, W. Eddy, W. Argall and C. E. Clinch of Grass Valley for \$30,000 on eighteen months' time and continuous operation. It will be immediately pumped out and new machinery put in. The construction of a mill is in contemplation in the near future.

## COLORADO.

### BACA COUNTY.

G. T. Feast, of Lamar, and other Lamar parties propose to build a matte smelter on Carrizo creek to work copper ores. The smelter is to have a capacity of from 75 to 100 tons of ore a day. After the ore is smelted the matte will be hauled to Lamar on the railroad and shipped to Pueblo. The Independence, owned by C. F. Liggett, A. J. Harker and F. B. Drew, has contracted to furnish ore for the smelter for three years.

### BOULDER COUNTY.

The Texas mine, at Ward, has been bought by the Texas G. M. Co. of Montreal, Canada, for \$12,500 cash. The Texas has been idle for some time. The new owners will, it is said, install a large plant, unwater the shaft, and sink 300 feet deeper.

The contractors sinking the shaft of the San Blas mine, at Ward, have made a rich strike of gold ore assaying \$65 a ton.

## CHAFFEE COUNTY.

The Vesper M. & M. Co., at Turret, is driving a tunnel, now in 300 feet on the vein, assays showing an average value of \$12.50 per ton in gold.

The Latchaw M. & T. Co., near Buena Vista, have resumed work on the tunnel.

## GILPIN COUNTY.

The Ridgewood G. M. Co. has incorporated, capital \$300,000, to operate the Rialto mine, Central City. The mine has been developed by a shaft, down 600 feet, and by several levels.

Development work on the Seneca G. M. Co.'s Brooklyn mine, Central City, is to be resumed. New York parties own the stock.

H. P. Lowe and T. S. Dynes of Denver, leasing the National and Hecla mines, on Quartz hill, propose the erection of a mill in Central City. They have not yet decided the style of mill to be put in, except that it will be specially a concentrating mill.

## GUNNISON COUNTY.

A find has been made in Vulcan district by M. E. Smoot, of Spencer, in working some claims on the Cebolla through the Eagle Rock tunnel. A short distance underground a blind lead was cut, assaying from 9% to 15% copper and a little gold.

## HINSDALE COUNTY.

A power plant at the Henson Creek lead mines, is projected, to cost about \$20,000.

The Tobasco G. M. & M. Co., Sherman, R. L. Ray manager, are having plans and surveys made for a dam and power plant.

Reports from Lake City state that rich ore bodies recently opened in the Golden Fleece are being vigorously worked, yielding large amounts of ore.—Work is soon to be commenced on a power plant at the Henson Creek lead mines property, near Capitol City.

## LAKE COUNTY.

The Leadville Gold Basin M. Co., of Leadville, has been incorporated; capital \$500,000. It will operate twenty acres belonging to Big Four Gold-Copper Co. This ground is near the Fanny Rawlings and the Little Johnny. A 300-foot shaft has been located and will be pushed down to the ore on the north end.

The Kubera, a new proposition, is located near the Continental and G. M. Favorite, and a shaft is being sunk on it by T. L. Davis and F. X. Hogan.

Considerable attention is being given to placer mining deposits in Lake county and ground is being tested with drills.

J. W. Dixon, manager of Little Joe group, at Twin Lakes, Leadville, says the 20-stamp mill and tables will be completed.

## MINERAL COUNTY.

The Big Kanawha Leasing Co.'s United mine, at Creede, in by a tunnel 8700 feet, have struck ore assaying \$27 a ton at a depth of 1560 feet below the surface. The vein is said to be 5 feet in width, carrying 37% lead, .36 ounces gold and 2 ounces silver. The company propose to erect a mill.

## OURAY COUNTY.

The Home pyritic smelter, at Ouray, burned down a month ago, is to be rebuilt by the owners upon larger and more modern plans than the one burned. It is expected to have the new smelter ready for operation about July 1. T. Osborne is the manager.

## PITKIN COUNTY.

The Della S. mine, at Aspen, is discovered to carry cadmium in the ore. The whole face of a drift is in this character of ore and is said to assay 8% cadmium.

## SAN JUAN COUNTY.

The tunnel of the Waterfall, owned principally in Silverton, is in 200 feet and the face shows from 15 inches to 3 feet of ore said to go from half an ounce to an ounce and a half in gold and from thirty to forty ounces in silver. It is said the owners propose putting in a cyanide plant this season for the treatment of the ores.

The American tunnel of the Gold King Con. M. Co., at Silverton, is in 1000 feet. Manager Kinney contemplates the enlargement of the Gold King mill by the addition of forty stamps.

## TELLER COUNTY.

The new shaft of Orphan Belle, to work the Isabella at depth of 800 feet, is down 170 feet.

The Consolidated G. M. Co. and Bull Hill Consolidated Co., of Victor, have passed the dividends for April pending arrangements for consolidation of the two companies.

At the 100-foot level Little Frank S., Cripple Creek, the vein is believed to be an extension of the Joe Dandy vein.

The south drift on 700-foot level Independence is 800 feet south of the shaft and will be driven 700 feet farther. No change in the rock has been noticed. The shaft is now 1100 feet deep.

Work has been resumed on the mine of the Hilderbrand G. M. Co. at Cripple

Creek. The shaft is now down 250 feet, and it is proposed to cut a station at the 300-foot level and run laterals out to explore the ground.

Manager Harmon of the Atlanta claim of the Gilpin & Cripple Creek Co., Cripple Creek, states that a station at the 475-foot level has been started and the company propose to drive to the sidelines both east and west.

It is said work is to be resumed shortly in the United Mines Transportation tunnel. The bore is now close on the territory of the Coriolanus, and will cut it down 628 feet.

Parks & Berger, leasing block No. 1 of the Black Belle Co.'s property, at Victor, are driving for the ore shoot on 200-foot and 300-foot levels and producing excellent ore from the 150-foot. They shipped forty tons recently. The lessees have about 35 feet of work yet to reach the ore shoot in the two new levels.

J. Barbee, leasing on the Columbia claim of the Cripple Creek Columbia Co., has shipped twelve tons of ore estimated at eight ounces per ton. The ore is from winze from 340-foot level.

Manager Timmils of the Contact G. M. Co., at Cripple Creek, says they will immediately sink the shaft on the Don claim 250 feet deeper. The depth is now 165 feet.

The Clyde G. M. Co. has completed the 800-foot station and is installing a pump of 500 gallons per minute capacity. Sinking is to be continued to the 1000-foot level.

The shaft on the Comstock of the Solitaire Co. is down 50 feet, showing a 4-foot vein of the average value, it is claimed, of more than \$20 per ton.

The Leclair G. M. Co. has been incorporated at Cripple Creek. The officers are: President, A. Sharpe; secretary and treasurer, C. A. Gill. The company owns the Poor Man Extension, Lady Josephine and Quaker Asp. The Poor Man Extension is to be worked on company account.

The Independence ore shoots in the upper levels are reported to have been opened in the 900-foot level.

The Hoosier shipment of fifty tons from Tenderfoot hill, Cripple Creek, is reported to have returned values of \$183 per ton.

#### IDAHO.

##### KOOTENAI COUNTY.

L. Wagner, of St. Paul, Minn., who has examined the mine of the Harrison M. Co., at Harrison, says the company will put in a stamp mill this summer.

The Idaho G. & C. M. Co. are putting machinery on their claim in the Wolf Ledge district, near Coeur d'Alene. E. L. Abrams is superintendent.

It is reported that the ledge from which the gold on the Tyson placer claim—the new strike east of Tekoa, Wash.—is supposed to have come, has been found on their claim. The gold taken out has been rough and unwashed. R. Neill, of Tekoa, has bought the claim, paying, it is said, \$9000.

##### LATAH COUNTY.

The Jerico M. & M. Co., Kendrick, will build a road to its property on Gold creek. Machinery for development will then be taken in.

Placer mines in Gold Creek district are working with a good water supply. There is more placer work being done this season in that district than in recent years.

##### LEMHI COUNTY.

The International G. M. Co., a Vermont and Quebec corporation, is developing the Mastodon group, a gold-copper mine on Lost creek, near the north fork of the Salmon river. The vein outcrops 15 feet wide, and if the results continue favorable, a concentrating plant will be installed.

##### OWYHEE COUNTY.

Capt. J. R. DeLamar has brought an action against the DeLamar M. Co., at DeLamar, for \$300,000. The charge is infringement on a patent on the cyanide process by using zinc dust as a precipitant. The allegation is made that 75,000 tons of ore have been treated, and \$1 royalty a ton is asked and \$225,000 for damages. The suit is a test case. If DeLamar wins, similar actions will be brought against a number of other companies.

##### SHOSHONE COUNTY.

It is reported that J. Gaffney is working on the Ozark mine, Prairie City, getting out a mill run of ten tons to find the value saved by ordinary mill process. If results are satisfactory he will build a mill immediately.

#### MICHIGAN.

##### HOUGHTON COUNTY.

Calumet & Hecla is reducing 4500 tons of rock daily. The trap rock underlying the Calumet lode is now being mined and stamped. It is positively denied that the Calumet & Hecla Co. have any connection with the copper trust.

The Tamarack and Osceola companies at the opening of lake navigation last year

had 7000 tons of refined copper on the docks. There are now but 300 tons. This is the first time in the history of Lake Superior copper mining that the docks were so bare of copper at the opening of navigation.

President J. Stanton, of the Mohawk M. Co. says: The new Mohawkite vein is 50 feet long, from 6 inches to 3 feet in width, and runs at least 600 feet from the surface diagonally downward. There are at least 3000 tons of this ore in sight.

#### MONTANA.

##### BEAVERHEAD COUNTY.

G. W. and A. French have shipped twenty-five tons of high-grade ore to the smelter from the Gold Finch and Dolphin mines, near Argenta, and expect a return of \$100 per ton.

##### CASCADE COUNTY.

The Missouri River Power Co., owning a dam and power plant at Canyon Ferry, and now constructing a pole line to Butte, will build another dam across the Missouri river at Stubbs' Ferry, 5 miles below the present plant. The new dam and plant are to cost \$1,000,000 and will develop 10,000 H. P., which will be sent to Butte. The company has contracts for power from the Amalgamated and other big companies operating in Butte.

##### FERGUS COUNTY.

The Spotted Horse mine is shut down to install a cyanide plant.

It is reported that Finch & Campbell will take up their bond on the Kendall mine, North Moccasin, and build the largest cyanide mill in Montana. It is said that they have bought the water power on Warm Spring creek and will put in an electric power plant, transmitting power to the mill, about 5 miles, and also a pumping station and a pipe line for water supply.

The Spotted Horse mines, near Lewistown, have been bought by the Central Montana Mines Co. for \$130,000, the first payment of \$30,000 being made. The Spotted Horse group has already produced several millions of bullion, and then suspended because of lower ore values not paying with the old costly methods of milling. Last season the reopening of mine and 20-stamp mill was begun and the Johana M. Co. organized. The mill had been repaired and was being prepared to start when the Central Montana Co. bought it.

##### FLATHEAD COUNTY.

The Fisher Creek M. Co. propose to increase their mill near Libby from ten to forty stamps. A turbine of 100 H. P. will be put in. G. Berrien is manager.

##### JEFFERSON COUNTY.

The Cataract C. M. Co., to mine claims in the Cataract mining district, has been incorporated with a capital of \$2,500,000; M. L. Hewitt, manager.

##### LEWIS AND CLARKE COUNTY.

The litigation between the Amalgamated C. Co. and H. M. Parthen over forty acres of land in Kenwood will, it is said, be settled out of court, and the Amalgamated Co. will at once start development of the ground.

J. J. Grady of Helena has bonded the Christiana mine in Greenhorn gulch. Mr. Grady intends to install a boiler and hoist and commence sinking.

M. Mitchell and T. Hird have bonded and are working on a copper mine at Old Blackfoot City, prospecting the surface to determine the best place to sink the shaft. The copper properties on the head of Snowshoe are attracting the attention of Spokane and Butte parties.

The Silver King mine, on the Ellis Fork of the Blackfoot, will be reopened by Peterson & Co.

##### MADISON COUNTY.

A shaft is down 300 feet on the Mountain View, near Twin Bridges, and a vein 25 feet wide is struck. It is claimed there is 6 feet of 10% copper ore, carrying some gold. J. C. Johnson, A. Johnson and E. C. Baxter of Butte are the owners.

Cutler, Morris, Wilkinson & Champlin of Whitehall have leased the Alaska mine.

##### SILVER BOW COUNTY.

The Boston & Montana Co. are asking the court to increase the bond of the Montana Ore Purchasing Co. in the Pennsylvania mine case from \$950,000 to \$1,250,000.

A new copper vein in the Anaconda mine has been found on the 1400 level. The discovery was made in a crosscut about 100 feet south of the stopes.

#### NEVADA.

##### CHURCHILL COUNTY.

A copper smelter is projected by Denver people in Churchill county for the Bell Mare Copper & S. Co., which they own. H. H. Barbee, manager, is to make the arrangements for the erection of the smelter.

##### ELKO COUNTY.

The Dexter Co., of Tuscarora, product

for March was: Gold bullion, \$9000; and cyanide cleanup, \$3000.

##### HUMBOLDT COUNTY.

J. C. Pierson is developing a sulphur proposition at Humboldt House.

##### LINCOLN COUNTY.

D. P. Doak and J. Schrader have bonded the Keystone mine, near Good-springs, and are reopening the old workings.

Goodsprings, April 18.

Manager P. Ryan of the Golden Star, at De Lamar, and his Eastern associates, have bought interests in the Jim Crow No. 2 and Nalad Queen mines, adjoining the De Lamar company's domain at De Lamar. Seven-eighths of the first and five-eighths interest in the second were taken on a basis, it is said, of \$50,000.

##### NYE COUNTY.

The 2-G and some other claims at Tybo are said to have been bought by the Tybo M. & R. Co., V. Barnd manager.

##### WHITE PINE COUNTY.

The Rocco-Homestake M. Co., of Salt Lake City, have recently had their mine at Galena examined by P. J. Donahue, who is said to have reported favorably and recommending the sinking of a new shaft.

##### WASHOE COUNTY.

At the Reno Star the ledge has been found and the owner, G. Wedekind, says it has been explored in width for 150 feet without signs of wall. The ore, he says, is pebbly in character, cemented with horn silver.

Sixteen men are working in the Reno Star and a carload is being shipped daily.

#### NEW MEXICO.

##### BERNALILLO COUNTY.

On the Star mine at Bland the Navajo Co. is using two air compressors and making much development, blocking out large bodies of ore.

##### COLFAX COUNTY.

The Golden Era M. & M. Co., Elizabethtown, have elected M. R. Baker president, F. L. Mulky secretary, and D. B. Loy treasurer. The company have their mill nearly completed.

The tunnel being run into Baldy mountain, Elizabethtown, by the Gold & Copper Deep Tunnel M. & M. Co. is now in 300 feet. The work is being done to reach copper deposits that are believed, from surface indications, to exist in this mountain.

##### GRANT COUNTY.

The Husten & Thomas group at Pinos Altos has been bonded by W. Kent and H. L. Hollis, Chicago parties. Twelve men are working under F. J. Buck, in charge as foreman.—E. Baker is doing development work, sinking and drifting on the Gold Coin mine at Hanover. The ore—a copper sulphide—is largely a concentrating proposition, and Mr. Baker is making tests to get the best method of treatment.—F. G. Cline is said to be successfully treating tailings from the Gold Hill mill, at Hanover, by the cyanide process, recovering about 70% of the value.

#### OREGON.

##### BAKER COUNTY.

A rich strike on the 160-foot level of the Perry mine, Baker City, has been made. The ore body is 5 feet wide and is said to average \$60 per ton. The mine is owned by J. W. McCoy and G. S. Wilson of Chicago.

The Brazos M. & M. Co. has incorporated, to exploit a mine near Baker City; capital, \$1,000,000.

A strike has been made in the Texas, Iowa & Oregon mine, on the North Powder river, about 27 miles north of Baker City. The mine is owned by B. F. Colley and G. S. Howland.

The Leo, in the Alamo district, is being experted by representatives of an English syndicate. If the report is favorable and the mine bought, \$100,000 is to be expended on it this season.—Eastern people have bonded the Climax and say the purchase money, \$150,000, will be paid within thirty days.—Milwaukee men have bonded the Blue Bird for six months at \$50,000.—L. Delome, of Montreal, Canada, representing stockholders, and Leon Shoyer, a French mining engineer, have examined the Richmond.

##### GRANT COUNTY.

It is reported that the Cougar mine, at Granite, has been sold for a large sum. It is owned by Larkins & Evans of Spokane, Wash.

##### JACKSON COUNTY.

The Sterling Placer, Ashland, is running with a big clean-up in sight.—On Foot's creek Stansell & Co. have hydraulicked a large area; coarse gold and some nuggets are yielded by this mine. This company, having a timber tract at the mine, propose to put in a sawmill at Woodville, the nearest railroad town.—The Ashland mine has a hoisting and pumping

plant on the 250-foot level and a full crew of men is employed. The base ore is shipped to the smelter.—It is reported a recent shipment to the smelter from the Reader mine, in Ashland Creek canyon, returned about \$60 gold per ton.

##### JOSEPHINE COUNTY.

A strike has been made at the Mountain Lion quartz mine, Missouri Flat district, near Grant's Pass. The mine is owned by L. L. Jewell, C. E. Harmon and G. and J. Bailey.

Hoffman & Pool, of Grant's Pass, developing the Archer ledge, in Thompson Creek district, near Grant's Pass, have taken out of ten tons of ore \$600.

#### SOUTH DAKOTA.

##### PENNINGTON COUNTY.

The Spearfish M. Co., operating claims in Deadwood district, has been working about three months, taking out, it is said, about \$20,000.

#### UTAH.

##### BOX ELDER COUNTY.

The Copper Mountain mine, near Tecoma, Nev., E. G. Tuttle manager, is having the Bingham C. & G. M. Co. smelt several hundred tons of ore. The group was bought about three years ago by the Lewisohns of New York for \$149,000. Recently negotiations for a sale to the Bingham Co. were begun. According to New York statements, the Copper Mountain group is to be taken into the Bingham consolidation for \$500,000.

##### JUAB COUNTY.

The Godiva, at Tintic, is working fifty men and is prospecting in new ground.

The Centennial-Eureka M. Co. is to construct a \$300,000 smelter at Tintic. The plans, made by G. K. Fischer of Salt Lake City, provide for 400 tons daily capacity.

The Humbug silver mine, at Tintic, has been bought by J. E. Dubois, of Dubois, Pa., and E. W. Center, of Salt Lake City.

##### PIUTE COUNTY.

Ogden and Salt Lake parties have incorporated to develop the Cyclone, Champeys, Monitor and Black Diamond claims in this county; capital \$5000; T. Champeys of Ogden is Pres. and C. Hill-ton of Salt Lake City is Sec.

##### SALT LAKE COUNTY.

The Northern Light, Grizzly and Fairview mining claims at Bingham have been bought by the United States M. Co. for about \$50,000.

##### SANPETE COUNTY.

The May Queen M. & D. Co. has incorporated at Gunnison to operate the El Paso and May Queen, in the Goose Creek district. The incorporators are F. M. Strong, C. B. Seldomridge, F. B. Tiffany, of Colorado Springs.

##### SUMMIT COUNTY.

The Century and West Century M. Cos. have executed an agreement terminating their conflicts and the suits are to be dismissed.

##### TOOELE COUNTY.

The Geyser-Marion, Rover, Silver Lode and Gold Dust group, at Mercur, are proposing to consolidate. The intention is to have R. C. Gemmell, State Engineer, survey the territory of the proposed consolidation, then to make an examination of the ore bodies now exposed in each group.

##### UINTAH COUNTY.

The Colorado-Grande Dev. Co., capital \$125,000, has been incorporated in Denver to mine manganese iron ore 12 miles south of Little Grande, where it owns 1140 acres. D. C. Dodge is president and E. T. Wolverton, vice-president and general manager. It is said the latter in prospecting for copper found an enormous deposit of manganese iron. There are also said to be coal deposits near by. A line for a branch railroad from Little Grande to the iron and coal fields is being surveyed. Four carloads of the ore have been shipped to steel works and the analysis made by them is stated to be:

|                  |       |
|------------------|-------|
| Iron .....       | 0.8   |
| Phosphorus ..... | .011  |
| Silica .....     | 4.35  |
| Manganese .....  | 42.65 |
| Lime .....       | 12.21 |

##### WASHINGTON COUNTY.

An additional payment of \$15,000 has been made on the Dixie mines and smelter at St. George, making the amount now paid \$75,000, and reducing the balance to \$125,000. The final payment of \$50,000 is to be made on June 20th. At present the smelter is running on excellent ore, while at the mine the opening up of the ore bodies at greater depth continues.

#### WASHINGTON.

##### FERRY COUNTY.

The entire mill plant of the Republic is now running and 150 tons are treated daily. As the mill wears to place, the speed will be increased and it is then expected to mill 200 tons.—The shaft on the Mountain

Lion, Republic, is down 670 feet, and will be carried down to 725 feet. Stations will be cut at the 600 and 700 foot levels. Crosscuts will be made to the ledge and the vein drifted upon and opened for stopping. There is claimed to be 12,000 tons of broken ore in the shoots and several thousands on the dump. Manager J. S. Wyatt has gone to Portland, Or., to consult with the company.—The Flag Hill, Republic, has been developed several hundred feet by tunnels. A 50-foot winze has been sunk from the tunnel level and drifts extended for about 350 feet. A winze is being sunk about 190 feet from the intersection point of the tunnel. The ledge is 6 feet between walls, the ore body from 4 to 5 feet. The ledge is believed to be the east and west ledge found in the Chespa-Blue Jay, Morning Glory and El Caliph claims.

The Chico shaft, at Republic, is to be put down 100 feet deeper before further drifting on the ledge. The ledge is said to be 6 feet wide, carrying ore averaging \$30 per ton.

#### OKANOGAN COUNTY.

The Rossman Co. is said to have bought a mill of 100 tons daily capacity for the Wauconda. The tunnel is in 675 feet and has passed through 42 feet of the ledge.

#### STEVENS COUNTY.

W. F. Stevens, superintendent of the Acme group, has returned to Kettle Falls from San Francisco and says a compressor, drills and steam engine will arrive and be placed in position at once. Mr. Stevens intends putting a large force at work. The Acme group is owned by the Northwest M. Co. of San Francisco. Barclay Henley is president; C. E. Finkam, vice-president; and W. A. M. Van Bokkelen, secretary.

#### WYOMING.

##### CARBON COUNTY.

The Burlington C. M. Co. has incorporated to mine four claims in Grand Encampment district. Directors are M. B. Camplin, New Castle, Wyo.; J. Wagoner and W. L. Sill, of Encampment; C. B. Camplin and H. G. Camplin, New Castle.

### FOREIGN.

#### BRITISH COLUMBIA.

The Fisher Maiden-Troy Mines, Ltd., has incorporated to work the Fisher Maiden group, near Selkirk. Work will be resumed about May 1st. C. H. Fisher, Rossland, is the organizer of the company.

A rush is being made to new placer discoveries in the Boundary district, on Rock creek, below White's bar.

On the Sunset, in Deadwood, Boundary district, some record-breaking shaft sinking is being done under contract by twelve men. Supt. H. Johns reports that in twenty-five days the shaft was sunk 110 feet. It is down 320 feet. The shaft is double-compartment, each 4½ x 5 feet in the clear.

B. Rea reports that the Tammany group, Rossland, will be started up. The control of the company has been bought by Saginaw, Mich., capitalists.

W. Y. Williams, Supt. Miner-Graves properties at Rossland, states that tenders have been asked for a forty-drill compressor and a hoist capable of handling 1300 tons daily for the Phoenix group.

The report of the Ymir Gold Mines for the year 1900 states that during the year the company added a 40-stamp battery to its stamp capacity and paid for it out of the year's profits. The directors report that, charging off £5605 for development, depreciation, cost of additional machinery and repairs to the old 40-stamp battery, a net profit of £30,928 remains. Concerning development, the report says the Ymir shaft has reached a depth of 258 feet below No. 3 level, or about 650 feet below the surface. The 1000-foot adit level is in 506 feet and is advancing 125 feet per month, and should reach the vein by the end of the current year, some four months before it is possible to work out reserves above No. 3 level. The vein above No. 3 level is reported wider than originally calculated. The question of applying the cyanide process for the treatment of the mill tailings has been considered, tests having been made with satisfactory results, and a ten-ton plant should now be in operation.

#### MEXICO.

The Ramona mine, at Galiban, Sonora, has a 4-foot ledge of high-grade silver ore exposed for stopping by a 300-foot shaft and 600 feet of drifts. It is equipped with a steam hoist and a 10-stamp mill; J. D. Fresh is Supt.

#### NEW ZEALAND.

Thirty-four men are employed on hydraulic sluicing claims in the Livingstone Goldfield, Otago, about 40 miles from Oamaru. The first dredger in that district is approaching completion and will operate near the mining reserve opposite Livingstone Township.

### Personal.

E. M. BIND of San Francisco has gone to Mexico to examine mines.

J. RICHARDS has returned to San Francisco from Washington, D. C.

W. H. JEFFREY has resigned as manager Sunset mine, Whitewater, B. C.

W. F. ENGLEBRIGHT of Nevada City, Cal., is visiting in San Francisco.

G. W. GRAYSON, who has been visiting Boise, Idaho, has returned to San Francisco.

JNO. C. RALSTON, mining engineer of Spokane, Wash., is visiting in San Francisco.

L. G. CLOUD, manager La Democrata mine, Cananea, Sonora, Mexico, is in New York.

C. S. MARINER, manager Dewey Con., Grangeville, Idaho, is visiting Spokane, Wash.

F. R. CULBERTSON, manager Tiger-Poorman mine at Burke, Idaho, has resigned.

J. A. FLEMING, Pres. Black Warrior C. Co. of Globe, Ariz., is in Philadelphia, Pa.

M. D. KELLY has accepted the superintendency of the Old Bonanza mine, Sonora, Cal.

J. W. DOWNING, Supt. Downing Con. G. M. Co. at Hornbrook, Cal., is in San Francisco.

LEWIS SEARING of the Denver Engineering Works, Denver, Colo., is in New York City.

J. T. WATERHOUSE, manager Con. Golden Trout M. Co., Lumpkin, Cal., is in San Francisco.

D. B. HUNTLEY, manager DeLamar M. Co., DeLamar, Idaho, is visiting Boise, in the same State.

MM. A. FARISH has returned to Denver, Colo., after several months' absence on professional business.

B. S. REVETT, manager North American G. Dredging Co., Colorado, is in Mexico, examining mines.

J. E. BEVERIDGE of Salt Lake City, Utah, has gone to Mexico to examine mines for Eastern people.

JAS. W. NESMITH, Pres. Colorado Iron Works, Denver, Colo., has returned from a brief sojourn in California.

CAPT. JOHN GRAY of Spokane, Wash., manager of the Crystal mine, has returned from a visit to Eastern points.

H. E. WHIPPLE, who has been at Torres, Mexico, for some months, has returned to Salt Lake City, Utah.

THOS. OSBORNE, manager of the Home Pyritic Smelter, Ouray, Colo., has returned from a visit to New York.

GEO. H. EVANS has bought 16,400 feet 5-inch pipe for use this season in his hydraulic operations at Breckenridge, Colo.

JACOB E. BAMBERGER has been elected Pres. Daly-West M. Co., Park City, Utah, taking the place of the late R. C. Chambers.

GEO. MCGILLIVRAY of San Francisco goes to Dawson, N. W. T., early in May to accept a position with a hydraulic mining company.

GEO. E. AMES, the San Francisco representative of Fraser & Chalmers (Inc.), Chicago, Ill., has returned to this city from the East.

CHARLES BUTTERS, managing director Minas Prietas Red. Syn., has been visiting the cyanide plant of the company at La Colorado, Sonora, Mexico.

J. A. KIRBEY, Supt. Daly-West, at Park City, Utah, has been appointed to similar position with the Diamond Con., at Tintic, in the same State.

THOS. J. BARBOUR of the Risdon Iron Works, San Francisco, returned from Nova Scotia as far as Denver, Colo., last week and went thence to Washington, D. C.

### Recently Declared Mining Dividends.

### Commercial Paragraphs.

THE Colorado & Southern Railway has issued an excellent railroad map of Colorado.

A. J. VAN DRAKE, expert machinist, on May 1st will move from his present location to the new building, 308 Mission St., San Francisco, Cal.

THE Pacific Engineering Co. has been organized to do general mining and metallurgical engineering. H. T. Brown and Clarence S. King are the managers and they have opened an office at 325 Montgomery street, San Francisco, Cal.

F. L. SMITH & Co., 66 Maiden Lane, New York City, engineers and builders of cement manufacturing machinery, have received the contract for equipping with Davidsen patent tube mills the plant of the Iroquois Portland Cement Co., now being built at Caledonia, N. Y.

THE Colorado Iron Works, Denver, Colo., are furnishing a 42x150 copper matte furnace for the Guggenheim smelter, at Aguas Calientes, Mexico; and a set of water jackets for the East Helena, Montana, plant of the American Smelting & Refining Co.

WM. B. SCAIFE & SONS, Pittsburg, Pa., have received a contract from Spang, Chalfant & Co., for extensive additions to their Etna Tube Works. A number of large steel frame buildings covered with corrugated iron will be erected, involving a heavy tonnage of structural material.

GEO. W. PENNINGTON SONS, Inc., have removed their office and branch works to 313 Folsom St., San Francisco. The main works remain at S.W. corner Montgomery and Chestnut Sts. They have recently added very large steam hammers, and have made other improvements, which enable them to make iron or steel forgings up to 30,000 pounds in weight.

### List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING APRIL 16, 1901.

- 672,344.—SNATCH BLOCK—Amundson & Knight, Blue Canyon, Wash.
- 672,401.—BICYCLE SUPPORT—R. Axel, S. F.
- 672,256.—MOTIVE POWER—G. A. Bobrick, Los Angeles, Cal.
- 672,257.—REFRIGERATOR—G. A. Bobrick, Los Angeles, Cal.
- 672,309.—LOCATING MINERALS—F. H. Brown, Los Angeles, Cal.
- 672,413.—GOLD-SAVING APPLIANCE—T. J. Burke, Los Angeles, Cal.
- 672,075.—STEERING GEAR—E. H. Cowart, S. F.
- 672,315.—WATER WHEEL—W. A. Doble, S. F.
- 672,186.—GAS GENERATOR—J. T. Edwards, Weaverville, Cal.
- 672,187.—GAS GENERATOR—J. T. Edwards, Weaverville, Cal.
- 672,320.—COUNTERBALANCE—R. E. Ford, Pasadena, Cal.
- 672,321.—BADGE—F. Frazier, Scottsdale, A. T.
- 672,406.—DESK TELEPHONE—H. Herbst, S. F.
- 672,371.—JAR CAP SEALER—W. L. Ingram, Wilderville, Or.
- 672,131.—TYPE JUSTIFYING—Lena A. Merrill, Riverside, Cal.
- 671,973.—GOLD-SAVING APPARATUS—W. Mobery, Oceano, Cal.
- 672,328.—NIGHT LAMP—H. Moller, S. F.
- 672,132.—NUT LOCK—Morgan & Main, San Jose, Cal.
- 672,242.—GARBAGE FURNACE—J. C. H. Stut, Oakland, Cal.
- 672,248.—FLOUR BOLTING MACHINE—C. L. White, Dayton, Wash.
- 34,378.—DESIGN—J. Ewing, S. F.

### Obituary.

THOS. TENNENT, one of the pioneers of San Francisco, coming before the discovery of gold, died in San Francisco on the 22nd inst. His first public work was as surveyor of the city under W. M. Eddy. In 1864 he began the publication of "Tennent's Nautical Almanac and Tide Register," which he continued for many years, and his tide and rain tables were considered of such value that they are still in use.

### Trade Treatises.

The Thompson & Boyle Co. have issued an attractively prepared catalogue of the Lane slow-speed roller mill, which can be had on application to Thompson & Boyle Co., 1101 North Main street, Los Angeles, Cal.

### Latest Market Reports.

SAN FRANCISCO, April 25, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 50c San Francisco, 48½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.75; carload lots, 16.62½. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £70 11s 3d per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.27½; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 7s 6d per ton—2.78½ cents per lb.

Lead is selling in London from 1½ to 1½ cents per pound lower than in New York. Sales in New York for foreign orders are made at this difference below domestic rates.

SPELTTER.—New York, \$4.20; St. Louis, \$3.75; London, \$16 2s 6d per ton—3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@16c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 28c; 1000 lbs., 28½c; 500 lbs., 28½c; less, 29c; bar tin, \$32½c.

ifornia St., San Francisco, Cal.

**Valuable Hydraulic  
Mining Property,**

located in Plumas County, Cal., containing 273  
acres, title U. S. patent, water rights, ditches,  
etc. **FOR SALE AT A BARGAIN.** Terms easy.  
For further particulars, apply to **ALMARIN B.  
PAUL**, 27 Crocker Building, San Francisco, Cal.

**FOR SALE.  
Gold Dredging Land.**

About 100 acres on river in California; few miles  
from railroad. Nine dredgers making big money  
in vicinity; other dredgers building. Land esti-  
mated to hold \$8000 gold dust to acre; 30 feet deep.  
Bond given. Address Box 40, this office.

**FOR SALE.  
ONE COMPLETE PLACER MINING DREDGE  
OF THE ELEVATOR TYPE.**

With buckets having capacity of seven and a half  
cubic feet. Dredge only used few months. Located  
on Grasshopper creek, near Bannack, Mont. For  
full particulars, address **THE BUCYRUS COM-  
PANY**, South Milwaukee, Wis.

**THE S. H. SUPPLY CO.,  
THE MACHINERY DEPOT  
OF THE WEST.**

22d and Larimer Streets, DENVER, COLO.

We have a 10x12 Lidgerwood Geared  
Hoist which is in as good condition as  
new. This is an exceptional bargain.  
We are offering it at \$950. The only  
objection we have to quoting prices in  
our advertisements is that a connection  
might be made between the price and  
the condition of the machine. This is  
not the case in this instance. Among  
the other hoists which we have are:

6x8 Double Friction, New.  
10x12 Double Friction.  
12x16 Double Drum Geared.  
11x15 Double Drum Geared.

We do not buy a boiler until we have  
the State and city inspection bureaus  
pass on it and state that they will issue  
a certificate as to the amount of pres-  
sure it will safely carry. This class of  
boilers, while not as cheap at first cost,  
are a great deal cheaper than those  
which you may find after a few weeks'  
service are condemned boilers. We also  
think we have the lowest prices on new  
standard and high pressure Boilers.  
The ones on hand at present are:

2 100 H. P. Heine Water Tube.  
2 80 H. P. Horizontal Tubular.  
1 60 H. P. Horizontal Tubular.  
2 40 H. P. Horizontal Tubular.  
2 35 H. P. Horizontal Tubular.  
15, 10, 8 and 6 H. P. Vertical.

Feed Water Pumps and Tank Pumps  
in every size that is made. We test all  
our pumps before sending them out.  
They are all guaranteed to give good  
service:

12x8 1/2 x 10 Worthington Duplex.  
12x12x12 Davidson Single.  
10x5 1/2 x 12 Deane Duplex.  
10x5 1/2 x 12 Smith-Vaile Duplex.  
12x7 1/2 x 12 Marsh.  
5 1/2 x 4 Fairbanks.  
Every size and make Boiler Feeds.

You know that we issue a catalogue  
every two months which can be had for  
the asking. This gives a good idea of  
our stock, and all prices are placed at  
the net prices so that you can tell just  
what it will cost you.

There is no question about our having  
the trade on Wrought Iron Pipe and  
Fittings. Send for quotations. We  
know that we can sell you pipe at sav-  
ing over any house in the city. These  
are new goods.

**THE S. H. SUPPLY CO.,  
22d and Larimer Streets,  
DENVER, COLORADO.**

**Bond and Lease Offered.**

Will give bond and lease on the Franklin &  
Union group of two patented claims on Turkey  
creek, Bradshaw mountains, 20 miles south of  
Prescott, Arizona. Has 600 feet development  
work, showing good body of high grade silver ore.  
Correspondence solicited.

P. P. BUSH, 1607-17th St., Denver, Colo.

# 120-Stamp Mill

**At Hassel, Montana,**

## FOR SALE.

**Will be Sold as Separate Items or Entire Mill.**

**Erected in 1897 by the Union Iron Works of San Francisco.**

**Only Partially Operated for a Few Months.**

**Guaranteed in Splendid Condition.**

**WILL NAME PRICES F. O. B. TOWNSEND, MONTANA, OR DELIVERED.**

## SPECIFICATIONS (Condensed).

- 2 NO. 5 McCULLY GYRATING CRUSHERS, with steel wearing parts.
- 26 ORE BIN GATES, 20" x 24", made of 5/16" steel plates, with racks, guides, boxes, pinions, shafts and hand wheels.
- 11 UNION CHALLENGE ORE FEEDERS, 11 right and 11 left.
- 11 10-STAMP BATTERIES. Stamps weighing 1000 lbs. each, arranged to be run in mortars of 5 stamps each, driven by belt and tighteners. Mortars especially arranged and designed for inside amalgamation, and weigh with apron 6500 lbs. each. (5 batteries never used.)
- 66 COPPER PLATES, 4' x 5', weighing 5 lbs. per square foot, plated with one ounce of silver per square foot.
- 6 OVERHEAD CRAWLS, complete with Norway Iron Hooks.
- 420 LINEAL FEET 1/4 x 1 1/2 TRACK.
- 6 1-TON DIFFERENTIAL CHAIN BLOCKS.
- 3 2-TON CHAIN BLOCKS FOR CRUSHERS.
- 47 UNION IMPROVED 4' VANNER CONCENTRATORS, complete in every particular. (29 never used.)
- 2 AMALGAM CLEAN-UP BARRELS, 28 x 36.
- 1 AMALGAM CLEAN-UP BARREL, 20 x 30, complete with tight and loose pulleys.
- 3 4' SWINGING BATTEAS and all fittings complete.
- 1 CAST IRON WASH TANK for clean-up work, 48 x 30 x 16.
- 1 HORIZONTAL 12" GOLD RETORT with all iron work complete.
- 1 SET OF IRON WORK FOR BULLION MELTING FURNACE.
- 2 MAIN DRIVING PULLEYS, 78 x 23 1/2.
- 2 MAIN ROPE WHEEL, 120", grooved for eight 1 1/2" ropes.
- 6 PULLEYS, 36 x 17.
- 1 LOT, being all necessary shafting, hangers, pulleys, belting, etc., for mill.
- 1 LARGE LOT OF PIPING, all sizes.
- 1 RAND DRILL COMPANY'S COMPRESSOR, 16 x 22, Class D, duplex (never used).
- 1 RANKIN & FRITSCH 16 x 22 CORLISS ENGINE.
- 1 HORIZONTAL RETURN TUBULAR BOILER, 75 H. P.
- 1 3-PHASE ALTERNATING CURRENT GENERATOR, 500 K. W., 60 cycle with 24 poles, type A. P., volts full load 2400, A. M. P. 120, revolutions 300, with rheostat.
- 1 ELECTRIC GENERATOR OR EXCITER, 12 1/2 K. W. Multipolar Direct Current Exciter, type M. P., class 4-12.5-12.75, volts 125, with rheostat.
- 1 MARBLE GENERATOR SWITCHBOARD PANEL, 30" x 90" x 2", containing one general field rheostat, one exciter field rheostat, one station transformer, one potential indicator, one current indicator, one pilot lamp, one ground detector with plug and receptacle, 3 type L lightning arresters, 6 feeder fuse blocks, one double pole exciter switch, two single pole switch brake 2000-volt switches, iron angle frame.
- 3 3-PHASE INDUCTION MOTORS, type "I," class 12-150-600, form "A," H. P. 150, cycle 60, volts 2080.
- 2 3-PHASE INDUCTION MOTORS, type "I," class 8-30-900, form "A," H. P. 30, cycle 60, volts 220.
- 1 3-PHASE INDUCTION MOTOR, type "I," class 10-50-720, form "B," H. P. 50, cycle 60, volts 2080.
- 100,000 FEET NO. 2 B. & S. COPPER WIRE.
- 1 LARGE LOT OF ELECTRICAL FIXTURES AND FITTINGS.
- 2 PELTON WATER WHEELS, 350 H. P. each.

# UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

Patented Dec. 5, 1899; May 29, 1900.

## THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

## HOLT BROS. Traction Engine For Freighting and Logging.

50-HORSE POWER. CYLINDER 11 x 12. MAIN WHEELS 24" x 7' 6".

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

**EVERY ONE A SUCCESS AND MONEY MAKERS.**

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

## THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/2 to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Sole Manufacturers of

**Kendall's Patent  
Quartz Mills.**

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at Greatly Reduced Prices. Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

## P. & B. READY ROOFING

is adapted for either flat or steep roofs of any design. The laying of it is so simple that any person can complete from 6 to 10 squares a day, thus saving in labor.

P. & B. Ready Roofing is used successfully and easily over old and worn-out roofs, shingles, tin or asphaltum roofs, and is the only good roofing that does not require a heavy truss system to support it.

P. & B. Ready Roofing is 32 inches wide and is put up in rolls containing sufficient material to cover 200 square feet and weighing 90 to 120 pounds, according to grade. Its low rate of classification makes it the cheapest roofing to transport and its manner of manufacture makes it the most easily handled roofing. Anyone can lay it.

Send for booklet. Address Department "A."

PARAFFINE PAINT CO.,

116 Battery St., San Francisco, Cal.

## ADAMANTINE SHOES AND DIES.

\*\*\*\*\*CHROME CAST STEEL\*\*\*\*\*

CANDA Improved Self-Locking CAMS.

TAPPETS, BOSSES, ROLL SHELLS AND CRUSHER PLATES.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

## MINE BELL SIGNALS.

Adopted, Used and in Force in Accord-  
ance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

# CATES IRON WORKS,

650 Elston Ave., = CHICAGO, U. S. A.

It is now twenty years since we designed and began to build the GATES GYRATORY ROCK AND ORE BREAKER, since which time we have built nearly 5000 of these machines and set them at work in every quarter of the globe. The success attained by the introduction of this wonderful invention has been equaled by few triumphs in mechanical arts. We have constantly been improving the construction of the machine, and although in the lapse of time many of the original patents have expired, the Gates Breakers to-day are covered by more patents than ever before. We have continually been increasing the size of these machines until now we offer the public our size 9, weighing 150,000 lbs., having a capacity of **200 TONS PER HOUR**, and receiving masses of rock or ore weighing more than half a ton.

There are more than two hundred of these Breakers in the South African gold mines.

The Homestake Mining Co. of South Dakota, one of the largest mining properties on the North American Continent, paying a dividend every month, and having ore enough in sight to keep its 1000 Stamps busy for fifty years, uses

## 15 GATES ORE BREAKERS

and buys Gates justly celebrated Stamp Shoes in lots of 10,000.

We build every class of strictly modern

## MINING MACHINERY.

For instance: The Trail Smelters and the Granby Consolidated Mining & Smelting Co.'s plant were supplied by us, and they are the model smelting plants of British Columbia. We guaranteed a capacity of 500 tons per day in the Granby Co.'s two furnaces, while they average 600 tons per day, and have handled as much as 736 tons of copper ore in twenty-four hours.

Gates Mining Machinery is always a little better than it is guaranteed to be.

We build the following Specialties besides those above mentioned: **Stamp Mills, High Grade Rolls, Dryers, Roasting Furnaces, Hoists, Elevators, Screens, Concentrators of every class**, and, in short, every improved mechanical device for working and reducing the precious ores. We built the first Stamp Mill ever set up in the Rocky Mountains. Our manufacturing history covers a period exceeding sixty years. We publish seventeen booklets fully describing our

**MINING MACHINERY, CEMENT MAKING MACHINERY, ROCK AND ORE CRUSHING PLANTS,** Including Ballast and Macadam Plants.

## AMERICAN EXPANSION PULLEY.

RUN

ANY CONCENTRATOR

application.

## DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

**NO WATER NEEDED.**

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quick-silver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

## No. 045 Button Balance.

Sensibility 1-50 Milligramme.

This balance was designed with a  
 view to furnishing an accurate and  
 reliable balance for silver button and  
 moderately accurate gold button  
 work.

It has all the latest improvements  
 and is an up-to-date balance in every  
 particular.

If you anticipate buying and want  
 a good balance at a moderate price,  
 write us for particulars; you will be  
 surprised to find how cheaply this  
 balance can be purchased.

For complete description of this and  
 other balances write for catalogue A to

**Wm. Ainsworth & Sons,**  
 (Successors to WM. AINSWORTH.)

## SCALE---SCALE---SCALE---SCALE---SCALE.

It does not do you any good to overlook your boilers; and because there are some 3000 ideas on the market which have been tried and have failed, is no sign it cannot be removed and kept out. There is no money, knowledge or Laboratories back of these 3000 patent medicines.

Try a little Chemistry and Laboratory direction and see the saving in coal, boilers, etc. Write us.

**DEARBORN DRUG & CHEMICAL WORKS,**  
27, 28, 29, 30, 31, 32, 33 & 34 Rialto Building,

SOLE AGENTS.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

**CYANIDE WORK**

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## SOLAR HOUSE LIGHTS

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs \$4.00 Per Light

EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Needs any town gas service in existence. No complications, nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No small, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known. Write us for particulars.

DISTRIBUTORS TO THE TRADE:

## DEWEY, STRONG & Co.,

**PATENT SOLICITORS,**

330 MARKET STREET, - SAN FRANCISCO, CAL.

AND 918 F STREET, N. W., WASHINGTON, D. C.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

## THE CAL. ANTI-CALORIC COMPANY,

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD savor in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

### The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

## ASSESSMENT NOTICES.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.  
Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of April, 1901, an assessment (No. 22) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALEX. GRANGER, Secretary.

Office—Room 223 Crocker Building, San Francisco, California.

**SOUTH SLIGER GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Spanish Dry Diggings Mining District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of March, 1901, an assessment (No. 1) of two cents per share was levied upon all the issued or subscribed for capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 402 Front street, Room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. L. DANIELS, Secretary.

Office—402 Front street, Room 8, San Francisco, California.

**AMERICAN OIL AND REFINERY COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of March, 1901, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, Room 323 Parrott building, 825 Market St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. C. ANTHONY, Secretary.

Office—Room 323 Parrott building, 825 to 855 Market St., San Francisco, California.

**OSCEOLA CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of April, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

## DELINQUENT SALE NOTICE.

**LARKIN MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 10) levied on the 12th day of March, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Names             | No. Cert. | No. Shares. | Amt.   |
|-------------------|-----------|-------------|--------|
| T. W. Baker.....  | 201       | 250         | \$5 00 |
| T. W. Baker.....  | 22        | 20          | 5 00   |
| T. W. Baker.....  | 201       | 250         | 5 00   |
| T. W. Baker.....  | 201       | 250         | 5 00   |
| J. E. Krafts..... | 211       | 250         | 5 00   |
| J. E. Krafts..... | 354       | 250         | 5 00   |

And in accordance with law, and an order from the Board of Directors, made on the 12th day of March, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 112 Main street, San Francisco, California, on WEDNESDAY, the 15th day of May, 1901, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

## Special Meeting.

**OXFORD BETA TUNNEL AND MINING COMPANY.**—There will be a special meeting of the stockholders of the Oxford Beta Tunnel & Mining Company, to be held at the office of the company, No. 135 Geary St., Room 111, San Francisco, at the hour of 4 o'clock P. M. on the 4th day of June, 1901, for the purpose of increasing the capital stock of the company from twenty-nine hundred shares of the value of one hundred dollars each to one hundred thousand shares of the value of two dollars and fifty cents each. By order of the Board of Trustees.

W. H. KNIGHT, Secretary.

## FRENIER'S SPIRAL PUMP.

For Elevating Tailings, Slimes, Battery Sands to Jigs, Etc.

## Mother Lode of California.\*

Twenty-one years ago the writer rode over the line of the mother lode from Placerville in El Dorado county to Princeton, in Mariposa county, Cal. It was then an almost unbroken line of abandoned mines and silent stamp mills. It was the low level, the depression point, of the gold quartz mining industry resulting under the old conditions of costly mining and milling, and a belief that the profitable ore bodies were near the surface and had all been worked out.

A scant half dozen mines in that whole line were active and producing. The Keystone at Amador City, a view of which appears on this page, the Haywards mine at Plymouth, the Mahoney at Sutter Creek and the Gwin in Calaveras county were the only live mines then. The Utica, Kennedy, Argonaut, Oneida, Rawhide, Dutch, Jumper, and many others, since then large and profitable producers, were at that time believed to be worked out and dead permanently. It was a matter of common belief then that the mother lode could be bought from end to end for less than a million dollars. No one then would have considered the investment desirable.

Now a similar journey would disclose practically the reverse condition, an almost unbroken line of active producing mines. New ore bodies have been found in the interval, the limits of the old known ones have been extended, costs of exploitation have been reduced, the mines have been found to go down, and as a consequence many great mines have years

of active profit-earning life ahead of them.

The revived gold mining industry is industrially clean. It produces yet does not compete. Its production is directly available to the miner, the money

metal of the world. It has all markets. No adverse organized commercial interests, by merely changing bits of paper between them, can divide its legitimate profits with the people really entitled to them.

## Secretary's Decision in Oil Land Cases.

The Secretary of the Interior has dismissed the appeal of the scrippers from the decision of the Commissioner of the General Land Office, sustaining the mineral claimants in the oil land cases. He says in his decision that the right of selection of lieu land for land included in a forest reservation was an offer to exchange on the part of the Government, and that it is incumbent on any one selecting to take advantage of the offer made by the law to establish the fact that the land selected is of the character contemplated by law. Until this fact is established the proffer of exchange is not completed. To lodge in an applicant for exchange of lands under this law vested right as against the ownership of a third party, it must be made to appear that the land sought to be acquired is of the character contemplated by the law. It is essential that the applicant should show that the land selected in exchange is vacant. Portions of public lands may be occupied and for that reason be not subject to selection, and yet there be no mention of their occupancy in the records of the land department. It frequently occurs that persons desiring to secure title to lands under the homestead law settle upon and occupy the same for months and even years before placing their claims on record. The decision also notes the discovery of petroleum made on the land since the contest was initiated as having made the land clearly mineral land, and, therefore, not subject to selection.

The decision is a gratifying victory for the miners. The language of the decision is very broad. Besides practically settling the vexatious litigation which has burdened the oil industry, there is a recognition of principles that have a bearing on the long-drawn-out contest between the miners and the land grant railroads. The definition of lands that could be selected in exchange for forest reserve lands as lands that must be vacant, unoccupied physically or unclaimed, at the time of selection would seem to apply to the separate tracts of land granted a railroad at the time the grant attached. So applied, much—and, indeed, most—of the mineral lands in dispute would be excluded from the grant and could not thereafter be brought within it.

The fees allowed by Judge Clancy in the receiverships of the Boston & Montana Co. are a reminder of bonanza days on the Comstock. T. R. Hinds, receiver for five and one-half days, was allowed \$200,000 and counsel fees and expenses amounting to \$31,116 more.

## Miners' Associations.

Some ten years ago, as a result of business conditions that had been gradually growing up during the preceding decade, the miners of California organized in self-protection the California Miners' Association. An organization, based on a measure of real injury to some valley lands as a result of forty years of mining in the mountains, was actively engaged in closing down without recourse a great existing placer mining industry—at the most, only partially responsible for the injury. The railroad was engaged in restricting the area of mineral land open for the exploitation of the miner by appropriating under its land grant lands which Congress had intended to reserve from the grant for the miner. These two strong organizations attacked the miners, who had no organization and no unity of action, and were rapidly annihilating and appropriating their industry. The miners, realizing their individual helplessness, organized to resist the pressure on them. The result of that organization is the practical restoration of hydraulic placer mining, and the preservation in the public domain of vast areas of mineral-bearing land. Directly they accomplished the specific objects of their organization, and indirectly they did greater things. They developed the idea and fixed it in the minds of people who were not miners that mining was a legitimate business, which could repay thrift and intelligence, the investment of money and time, just as did any of the other commercial occupations. Mining as an industry in California to-day is a business of greater magnitude, as a result of the interest developed in it by the organization of the California Miners' Association. It receives more consideration and assistance from all classes of our people as they realize how dependent on it have been all the other producing and commercial industries of the State of California.

This brief resume of conditions and how they were met and overcome is given to draw a parallel between California mining of ten years ago and what it seems the mining of other States and Territories is now. Miners in these States are finding that there is on them a commercial pressure to their disadvantage. Just as in California, there are two interests opposing—the railroad, as in California, and the combined trust of the smelting industry. The alliance between the two adverse interests is closer than it was in California. In the latter State the gold mining was so independent of transportation that the method of attack by discriminating freight charges could do little; but with miners dependent on smelting methods of reduction, the pressure of discriminating transportation can be made annihilating in its force. The smelters have even greater repressive power; for the railroads are semi-public institutions which are common carriers. Smelters are private affairs entirely and have no quasi public control over them.

The condition confronting the miners of these States is made rather more serious than the California condition by the control of the market possessed by the combination of smelters and railroads, or, rather, of the people who own both. They are, as well, the sole sellers of the products, and the great manufacturing trusts they also control are the chief buyers.

The miner in the scheme of things as being contrived is simply a producer of raw material, reduced to a condition of indirect involuntary servitude. Singly he is helpless against such attacks as the iron-clad contract being submitted to him by the American Smelting & Refining Company. He must accept the partnership of people in his profits who carry absolutely none of his risk. The result this paper anticipated on the announcement of the organization of the Smelting Trust is already forced. The miners must combine.

The meeting of all the silver-lead mine owners in the West called from Denver is a result. It is necessary, proper, and timely. It should go further, and be more inclusive. The example and lesson of California experience should be studied and followed. Organization should begin with units of counties, it should build into State organizations, these last should affiliate and become as one. The interest should not be limited to one class of ore production as the silver-lead men. It should include the mine owners of all classes of mines, the owners of indepen-

dent treatment plants, the local builders of mining plants and machinery, the commercial men of the mining camps and the workers in mines, the men who have brain as well as brawn. All these people should realize the interdependence of their interests in the contest now initiated and should stand together. The power opposed which can enforce the acceptance of such contracts as are proposed by the American Smelting & Refining Co. can decide whether or not a mining town shall exist or be wiped off of the map. Others besides miners are interested in this phase of the question.

California miners did not find it necessary to consolidate their mines to accomplish results. It does not appear necessary now. What is wanted is unity of action and directness of purpose. There should be no scattering among many desirable things that miners' associations could accomplish. There is work enough cut out now. The issues should be limited to it.

The business of mining was based on the principle that the rewards of it belong to those who seek and secure them in the bowels of the earth, risking fortune and life in the attempt, and not to those who on the surface of the earth, risking neither life or fortune, beneficate what has already been brought into being. The profits of mining belong to the miner, not to the millman or smelter or railroad carrier. Let the effort of association be directed to make this principle, which was, when men from choice became miners, be the principle which is, now that miners have only to hold what their effort has gained. Establish this business principle with all the force of law. Make it operative commercially. Establish further the principle that the small mine owner has an equal right to the profit of the ore he produces with the large mine owner. That he is entitled to the same payments and to no greater costs per unit. It must be conceded that he has far more than an equal necessity for this equality of commercial right.

The condition does not admit of compromises. The miners are logically and commercially right in demanding the profits of mining. The industrial condition which would give to the smelters and transportation these profits is an absurdity. It cannot exist if the miners' associations properly direct their efforts and persist in their direction till they have accomplished.

THE State of Nevada shows signs of a revival of something like the old time activity in mining. Tonopah, from all accounts a live, growing mining camp, is building up on a discovery of value in lodes the croppings of which are said to stand out so boldly as to be visible miles away. That the discovery should not have been made years since is surprising. Reno is starting into mining activity over a close-by discovery of rich silver ore. Float chloride of silver was first found, and then traced to its lode source. The latter—hardly scratched yet—is said to be showing considerable extent and excellent values. The location is not distant from the Comstock lode and the developments made so far make this discovery well worth watching.

THE Colfax Folio of the U. S. Geologic Atlas practically completes the publication covering the gold-bearing region of the Sierra Nevada mountains in California. The work as a whole shows progressive improvement with the successive folios issued and is invaluable to California miners, and of unique technical interest to geologists generally. There is probably no similar area anywhere in the world. The yield of either placer or lode gold has not been attained areally in any other locality. There is no lode system on so grand a scale. The phenomena of buried rivers and of the structural geology they make are nowhere more intelligible, nowhere are they more commercially fascinating.

THE foreign agitation of a commercial alliance against the United States for the purpose of restricting our export trade could hardly result in affecting the exports of the products of our mines. These latter are indispensable in increasing quantities to foreign industry, and the foreign countries requiring them do not seem able to increase the production of their own mines.

## Concentrates.

THE metal from Bishop Creek, Inyo county, Cal., is tin.

SUBMERGED gravel beds can be tested for gold by drills.

A TASMANIAN tin mine has paid 287 dividends aggregating \$9,000,000, being \$705 on each share.

EMERY WHEELS should be given a rim speed of 5500 feet per minute to work at their best efficiency.

THE total gold production of Cripple Creek to date is \$100,000,000. Of this, \$20,000,000 has been paid in dividends.

THERE is an increasing demand for mica for use in the arts. It is employed ground very fine in the manufacture of fine grades of wall paper.

INFORMATION relating to mining of borax deposits is to be found in the third, eighth, tenth and eleventh reports of the State Mineralogist of California.

ACID WATERS are prejudicial to amalgamation. The quicksilver is attacked and sickened. Quicklime added to the water will remedy the acidity of the water.

THE most intense heat known is that of the electric arc. Next to that is the heat produced by the combustion of aluminum. It is known to be in excess of 5000° Fahr.

GOLD in black sand is ordinarily a mechanical admixture. Drying the sand and removing the magnetite by magnetic parting devices leaves the gold in much easier recoverable condition.

CINNABAR occurs occasionally in crystalline incrustations, color red, streak scarlet. Its composition is: Mercury, 86.2%; sulphur, 13.8%. It has been found in the Cascade mountains, in Oregon.

MAGNESITE, carbonate of magnesium, is used in the manufacture of paper. The preparation consists of roasting and grinding to a powder. There is a roasting furnace in operation at Porterville, Cal.

AT the Harrison Gulch mine, in Shasta county, from ore assaying \$30 a ton, there is recovered \$20 by amalgamation and \$9 by cyanide treatment of the tailings. The total recovery is thus about 96.66%.

CALIFORNIA has the distinction of having the longest electrical power transmission in the world. The Standard Electrical Co. transmission line from the Mokelumne river in Amador county to San Jose is 184 miles long. The voltage used is 60,000.

IN locating a claim, the natural objects or permanent monuments required by the mining statutes to be referred to are not required to be on the ground located, though they may be, and the natural object may consist of, any fixed natural object.

MAGNALIUM is the name of a new alloy of aluminum and magnesium, containing from 2% to 30% of the latter. This new metal is said to retain the better qualities of aluminum. It can be worked with a file, turned or planed, and is a good solder.

POWER SCHEMES including whole counties have been projected in England. The proposition was to convert coal into electrical power at the coal mines and to distribute it by wire to all users of power, doing away with independent plants altogether.

OPALIZED WOOD has no regular market value. The Arizona variety is sometimes cut into slabs for ornamental purposes. A start was made at using it for an abrasive, but the discovery and manufacture of carborundum made it unprofitable.

OIL WELLS have great drainage power. They have been known to draw from distances up to half a mile. It is not necessary to sink wells close together to get all the oil. The sinking of a well on each acre of an oil-bearing tract is wasteful and unnecessary.

THE right to a mining claim location, once sufficiently marked out upon the ground and the other necessary acts of location performed, cannot lapse or become forfeit by the obliteration of the marks or removal of the stakes without the fault of the locator.

THE total population of Alaska, including the natives, is 63,592, according to the census of 1900. Nome City had a population of 12,486, Skagway 3117, Juneau City 1864, Sitka 1306. Porcupine, Seward City and Klukwan are omitted from the return of population.

THE aim of the millman operating a stamp mill should be to eliminate what are termed avoidable losses of time. There should be no keys working loose, no belts or tappets slipping, no stamp heads coming off. All of these causes make time losses that are avoidable.

FOR dry crushing rolls, ball mills and stamps have definite ranges of efficiency which determine the choice of type for any particular kind of work desired. The rolls give a better result in granulation, ball mills in absolute pulverization. Stamps are not as satisfactory as either of the others.

NEVADA STATE has offered a bounty of \$1000 to the producer of the first five barrels of petroleum from a well in that State, and to the producer of the first thousand feet of natural gas. The person who has the first 6-inch artesian well 1000 feet deep flowing not less than sixty gallons of water a minute shall receive \$2500 bounty.

FOR a very long pipe line, designed to carry a large

volume of water, the economic head is usually very low. That is, it is less costly to increase the diameter of the pipe and decrease the velocity of flow, so as to make the delivery with the lowest practicable head. The economy comes in in decreased cost, due to a decreased quantity of metal required in the pipe.

SOME gold in ores exists in such a fine state of division that it will float almost indefinitely in water. Occasionally an ore is found in which the quantity in such fine state of division is so large that its loss makes wet crushing and amalgamation wasteful. The proper method of treatment, other than smelting which would surely save it, would seem to be by crushing dry and cyaniding.

IRIDIUM and osmium combined in the mineral iridosmine occur in small, flat scales in gold-bearing gravels of northern California. A lately discovered locality is in one of the headwaters of Cottonwood creek, in Shasta county. There is quite a demand for osmium in connection with the mantles for incandescent gas lamps. The commercial price of the refined metals is about the same as platinum.

THE discoverer of a lode may locate portions of his lines on a previously located claim so as to get all the extralateral rights that are not appropriated by the extralateral rights of the previously located claim, and in mining may follow his lode within the lines of the previously located claim so long as the workings are not on portions of the lode held under the extralateral rights of the prior location.

THERE is considerable variation in the quantity of water required in stamp mill practice. In California mills the range has been from 227 cubic feet to 513 cubic feet to the ton of ore stamped. While the character of the ore and the fineness of the crushing determine to some extent the amount used, the construction of the mortar and the height of the discharge are the principal factors in causing the wide range of variation.

THE formula for indicated horse power of a steam engine is  $IHP = \frac{2PLAN}{33000}$ , where P = mean effective pressure of the steam on the piston head per square inch, A = area in square inches of the piston head, less one-half the area of cross section of the piston rod, L = length of stroke in feet, and N = number of revolutions per minute.

STEAM COAL for naval use at Manila is restricted to a choice between inferior Japanese coal, costing \$4 a ton, or Australian of good quality, costing \$12 a ton. There are coal beds of excellent quality for naval use close to Vladivostok, in Siberia. The conservatism of the Russian Government has prevented development, though their accessibility is such that the production would take the market to the exclusion of the Japanese coal, on the score of quality, and of the Australian, on cost.

A METHOD of gold mining employed in a few instances in California, and notably in Georgia, combines hydraulicking and wet crushing by stamp mill. The soft gold-bearing rock and its surface soil and sand covering are hydraulicked through sluices and the coarse rock that does not pass the grizzlies is delivered by the sluice at the mill, where it is stamped. The total cost for all the material handled has been brought as low as 8 cents per ton. The stamping is necessary, as the gold is largely in the coarse rock that the hydraulicking does not break up.

A NOVEL application of compressed air lately suggested is in timber felling. The practical difficulty would be to supply the compressed air. Substituting for compressed air an electric motor, the technical difficulty disappears and comparative cost to hand labor is the only point to be considered. The motor could be attached to the auger, the tool used. Sawmills are now provided with electrical plants, and the wires transmitting are readily placed and movable. Two men with electric power augers can do the work of a dozen men with saws, both in felling and cutting into lengths.

A GOOD MIXTURE for the molds when casting steel is made by using linseed oil in place of molasses and sour beer in to hold the sand together. Owing to the higher temperature of fusing of steel over iron, the sand itself becomes fused and glazes, and roughens the castings. The linseed oil seems to soften the sand of the cores. The reason for it is that the oil is fired by the hot metal in being poured. The gases released produce a film between the casting and the core sand, keeping them separated, and vent holes should be provided. Other oils have not been used successfully. They burn out in the drying of the core, whereas the linseed oil thickens and forms a gum, to which the sand adheres.

POTASSIUM CHLORIDE, the mineral carnallite, is practically the commercial source of the potassium chemicals. In the locality of its occurrence at Stassfurt, Germany, it is found in beds alternating with thinner beds of salt and kieserite, a hydrated sulphate of magnesium. Carnallite is a brittle, transparent to translucent mineral, milky white and often reddish in color, strongly phosphorescent. It is readily soluble and has a bitter taste. Its composition is potassium, 14.1%; magnesium, 8.7%; chlorine, 38.3%; water, 39%. As found in nature it can be separated in a fairly pure condition by solution and crystallization by similar means to those employed in the preparation of commercial borax. It has little direct use but is the raw material for most of the potassium chemicals. Its probable value at chemical works is from 1 to 2 cents a pound, but if a large deposit were found in

the United States it is valuable and important enough to be worth consideration as the basis of a chemical works itself. The potassium chloride, the mineral sylvite, corresponds to the sodium chloride, common salt. It is, so far as yet known, a mineral too uncommon to be used commercially to any extent. It is found at Stassfurt. Containing 52.4% of potassium it would be worth as raw material about four times as much as the carnallite. Carbonate of potassium is so deliquescent, absorbent of water, that it is of doubtful occurrence in natural deposits. It would be, if found, as valuable as the chloride as raw material for the commercial potassium chemicals. There is no reason why these salts should not exist in some of the dry lake beds of Nevada and southeastern California and be as commercially utilizable as the borax deposits.

CONTACT LODS—that is, veins formed at the line of joining of two dissimilar rock formations—frequently offer opportunities for the employment of diamond or core drills in prospecting. This is particularly the case if one of the formations is notably softer than the other. Lodes formed on contacts are frequently accompanied by more or less regular bodies of ore in the softer rock, with which they are connected by seams and stringers, or by a lesser mineralization of the intervening rock. All the stringers do not lead into ore bodies of commercial value, and it is not always economical to follow them by the ordinary mine openings. The core type of drill can be utilized to considerable advantage in cross-cutting the probable ore-bearing zone. The cores assayed permit the construction of a map which will be a guide not only for the direction of further use of the drill, but for directing the exploitation of a proved deposit.

SOME of the quicksilver-bearing deposits and oil-bearing sands lie close together in California. The metaliferous lodes are younger than the sandstone formations which hold the oil, as they are in part formed in them. The source of the metal is in the underlying metamorphic eruptives but the fissuring from below has in some instances broken across the overlying unaltered sedimentary beds. In mining in these lodes petroleum developed gases are sometimes encountered, indicating the breaking through of the oil-bearing formation by the lode fissure. The indications of near-by petroleum are so conclusive that a quicksilver mining company is proposing to drill for it on the surface of its lode claim. Petroleum is to some extent a metamorphic mineral. It is in its existent form as the result of a considerable degree of heat applied. The heat was not, however, sufficient to metamorphose the rock. Cinnabar and quicksilver volatilize at comparatively low heats. There is a strong possibility that the same heat which made the petroleum was also the moving force in the quicksilver lode formation, and that both were formed at or about the same period of time.

TECHNICAL ADVANCE in the application of mineral substances in the arts is so rapid, and is so wide industrially, that the prospector is safe in having every mineral new to his experience that he discovers determined before passing it by. Uses for minerals that a few years since were mere laboratory curiosities are becoming numerous and are demanding enormous quantities. Others that are common as a result of chemical and metallurgical discoveries become valuable where they were before unavailable. Notably is this so with iron. The reduction in the cost of making it from its ores has made transportation the great single item of the cost to the consumer of the finished product. The inevitable tendency, in order to reduce transportation costs, must then be to make the production as near as commercially practicable to the consumer. Cadmium seems to be another metal, hitherto of no commercial value because of restricted use, that now, as a result of special availability for electrical storage batteries, will be in considerable demand. Another conclusion that suggests itself is that it can hardly be said that any mining district is yet fully prospected and known. Such are worth going over again for the minerals that preceding prospectors were not looking for.

THE right of location of a mining claim can be exercised by the discoverer of valuable mineral on vacant public land—that is, public land that is not occupied by another valid mining location or on public land occupied by an agricultural claimant who has not proved up his claim. The discovery must be on this vacant public land. The discoverer of valuable mineral on land already validly claimed or occupied cannot by location hold anything at all. Mining location cannot hold the discovery and if it is not good as to the discovery it cannot hold ground on which there was no discovery, even though it is included in the location. The best way to do under such circumstances is for the discoverer to trace his discovery to a point outside of the validly appropriated land and, making a new discovery outside, to start his location from that. The lines of this location made from this last discovery may extend within the previously appropriated ground in order to secure the extralateral rights to the deposit discovered outside. It would seem that it were vital to the validity of a location to make the discovery on vacant public land. The ownership of the appropriated land on which a discovery was made is not material. The fact that the discoverer owns it by mesne conveyance or otherwise does not make a location made on it valid in locating ground outside of it. Ground inside of its boundaries does not require location to hold the mineral discoveries.

## The Keystone Con. G. M. Co.\*

The Keystone Con. mines are situate at Amador, in Amador county, Cal., and are among the oldest properties on the mother lode. They were discovered and first worked in 1850, yielding well from the old surface workings. The Keystone Con. M. Co. was organized in 1866 and in 1869 bought the adjoining Spring Hill mine. M. J. McDonald of San Francisco is president and principal stockholder in the corporation; W. A. Pritchard is the superintendent.

This paper in March, 1866 [Vol. XII, page 13], published the first printed account of the mines as part of its staff correspondence. The writer seems at that early day to have comprehended the geology of the mother lode, his description being singularly accurate to the facts as the subsequent mining has demonstrated them. He describes the great "mother vein of the State" as consisting of a principal ledge, "flanked by a series of subordinate, parallel ledges, running through the country in a northwesterly and southeasterly direction, and keeping the line of contact between the ordinary slate formation of the country on the western or foothill side, and a narrow belt of greenstone, which forms the eastern or hanging wall. The subordinate veins are wholly in the slate, or greenstone, as they happen to lie to the eastward or westward of the principal lead. The main Carson ledge [the old name of the mother lode] varies in width from 3 to 30 feet, and dips (to the eastward in all cases) from 35° to 50° from the vertical. The principal feature of this vein is the large size and steady character of the chimneys of paying ore, which, however, is generally of a low grade, from \$6 to \$8 per ton being considered a fair yield. The large size of the vein and uniform character of the quartz make its extraction and working very easy and economical. The subordinate veins vary more in the character and richness of their ores, and are generally smaller, although in one case—that of the Keystone claim at Amador City—the ledge, lying westward of the principal vein, is 20 feet in thickness." This general description of the mother lode, stated thirty-five years ago, cannot be improved on to-day.

Locally at the different mines on the hundred miles of the mother lode that have been more or less exploited there are variations of detail from this general description. The Keystone in detail has three veins—the main mother lode vein, the west vein and a third vein between, which has been called the

local enrichment of the vein. Raymond, in his Reports of Mineral Resources West of the Rocky Mountains in 1876, says: "The vein system of the mother lode varies in width, sometimes expanding to half a mile and again presenting the features of a true fissure. Where these expansions occur the veins are always broken and of low grade."

The underground developments on the Keystone

sequent working has been on the west or Keystone vein. Some has been done on the middle vein and less on the foot wall of the main vein in the old Spring Hill claim. The west vein was the principal source of the gold yield, however. The aggregate of it, including the yield prior to 1866, is \$11,575,451; and since 1866, \$3,765,900 was paid in dividends. The aggregate of its gross gold yield classes the Key-

Keystone Mine—Grey Ore in Face, 800-Foot Level South.

mine show a correspondence with the surface trend of the greenstone walls. The levels on the main mother lode vein and the middle vein conform to the alignment of the east wall of greenstone, taking a curve with the hollow facing northeasterly. The levels on the west (Keystone) vein seem to trend with the west wall and curve in the opposite direction. Going downward on the vein the east greenstone wall is persistent in dip northeasterly; but the west wall, after following the dip of the east wall to the 800-foot level, straightens up and appears to reverse its dip, so that the lode formed between the greenstone

stone as one of the great gold mines of the world. In its period of years of continuous operation and production it is probably the leading mine of the State of California.

The interesting feature of the property is the comparatively recent developments of ore in enormous quantities and of great profit-earning possibilities, the existence of which during all the years of operation of the mine had been overlooked. The west vein, mined so profitably, consists of a characteristic ore. It is full of little jet black seams (joint planes), along which the gold is principally found. It contains pebbles or kernels of quartz, which, broken, are found to contain a nucleus of gold. It is usually ribboned quartz, with black, slaty seams, is soft and easily broken under the stamps. The ore of the main mother lode vein is distinctly dissimilar in appearance, texture and mineral contents. The rock is exceedingly tough and hard as compared with the black ore, and contains twice as much sulphurets. It consists of masses of quartz in irregular bunches, irregular reticulated veins branching and feathering in every direction, all set in a great mass of more or less altered eruptive rocks, sheared, splintered, made schistose and slaty and sheeted by compression—the debris of an enormous fault fissure more or less replaced by deposits from infiltration of mineral-bearing waters. It is highly siliceous, though containing in veinlets some calcite. Gold and pyrite are found in the entire mass, except the larger and harder ribs or masses, which closely resemble the greenstone walls. The pyrites is more in the eruptives than in the quartz. The gold can be seen in the quartz occasionally. Next to the east greenstone wall there has been considerable enrichment, and in the Spring Hill mine and in crosscuts from the shafts of the Keystone proper this hanging wall seam has been followed and has yielded considerable rich ore, notably some extremely rich pockets.

In making the crosscuts to reach this extremely rich vein—or, more exactly defined, "seam of a vein"—the great mass of ore of the character described above was cut across and referred to by the miners as a mixture of greenstone and slate. The possibility that it was ore, that it carried gold in payable commercial quantities, that the rich hanging wall pocket seam and a rich foot wall seam, also mined to a minor extent, were integral parts of it were all overlooked for nearly a half century's mining. It is the discovery made inductively, not by accident, that this great mass of rock that has been passed by is really ore, "grey ore," as it is named by its discoverer, from its characteristic appearance in mass as shown in the half-tone view of the face of a 55-foot wide stope on the 800-foot level south—it is this discovery which has given to the old mine a new lease of life as long if not longer than it has had already, and possibilities of profit earning far exceeding its already excellent record.

The credit of the discovery belongs to Mr. Edward Lynch, not a miner either by profession or occupa-

Keystone Mine—Face of Stope, 500-Foot Level South.

middle vein. All of these at the surface outcrop between two bodies or walls of greenstone, which on the Keystone are close together, but which separate both to the northward and southward. The richest deposits of ore in the mine are where these greenstone walls are closest together, and a like condition of these walls in other noted mines on the mother lode seems invariably to be accompanied by a similar

walls appears to open out downward as well as laterally. The cross-section plat shows the characteristic relation of the three veins and of the greenstone walls.

Down till 1866 the greatest depth of the workings on the mine was 584 feet, and by far the greater extent of the workings was above 200 feet. The gross yield of the mine, the Keystone proper, up till that time is claimed to have been \$2,225,000.

The great extent of this old working and the sub-

tion. Perhaps to that, unconsciously, is due his accomplishment. An exaggeration of the minor details of local ore occurrence, so common to the miner who knows one mine only, did not confuse his inductive reasoning and the development of broad generalizations from maps and comparisons with other mother lode mines.

The "grey ore" is not an exception on the mother lode. It is the rule. Comparison with the ore worked at the Utica mine, Angels Camp, on the mother lode, about 30 miles distant, shows it to be identical in character. The same grey ore exists in the Kennedy mine, in the Wildman mine and in many other mines extending from Tuolumne county into El Dorado county. The great bonanza ore bodies of the Utica mine have been this ore. It is the persistent characteristic ore of the mother lode fissure. It is probable that to the exceptional extent and richness of the west or Keystone vein is in reality due the long continued overlooking of the greater ore deposit of the main mother lode vein.

The workings of the west and middle veins and of the foot and hanging wall seams of the main vein have practically opened the latter to 1000 feet of

depth. The crosscuts made in the old workings and the exploration drifting of the last three years since the discovery have developed a known linear extent of lode of 2100 feet. The developed width ranges up to nearly 200 feet, and may average 100 feet. The depth obtained in the Kennedy and Eureka mines may be safely anticipated in this. The half-tone showing the stope face on the 500 level south shows 96 feet width of ore. The half-tone on page 207 showing the double track on the 300 level north illustrates again the magnitude of the great lode.

A test run of 1000 tons made on the grey ore yielded \$5.30 per ton. Average assays from 10 or 15 feet thickness run between \$9 and \$10 to the ton. Some extremely rich pockets of specimen ore have been taken out; one in 1899 yielded \$25,000.

The cost of working, mining and milling with the present plant—steam-power hoist and water-power 40-stamp mill—is from \$2.36 to \$2.46 a ton. The company has recently let a contract to replace it by a new 60-stamp mill of heavier stamps, and have arranged to substitute cheaper electric power for the steam and water power now employed. The economies that will result with the improvements and changes are expected to materially reduce the operative costs. It is believed that the conditions will then be so far favorable that the record figure of low operative costs of quartz gold mining can be reached.

The Keystone mine has had an exceptional history covering all the years of California gold mining. It is not, however, so exceptional but that the advance of our knowledge of the mother lode may not in time prove that there are others, that have only been dormant possibilities, waiting the application of the same inductive logic and broad generalizations to become appreciated as being as great mines as the Keystone promises to be.

#### Value of a Theory.\*

It is the object of experiment to discover the facts that stud any region of nature—to chip away every encasing substance and lay bare the immutable kernel for contemplation by the mind: it is the province of theory to exercise the imagination and reason upon the relative bearing of these facts—to explain them—to weave about them a fabric whose design shows order, regularity and sequence, rather than mere agglomeration—to make this mantle of such form and size that, without undue stretching and piecing, it will cover new facts as they arise, and that others, obviously related to their predecessors, will not rend it.

A theory, besides thus affording a rational mental view of grouped phenomena, has the further value of pointing out the way in which new discoveries lie, and even sometimes of predicting the very nature of the facts to be found.

Facts are the isolated ingredients of which a theory may be compounded; and although the theory may be crude in the first workman's hands, still

others of more skill continually arise, until at last a genius gives it a touch, and we have a masterpiece, as in the grand triplet of electricity-magnetism-luminosity—a combined wave motion—growing out of the simple undulatory theory of light.

### Neocene Middle Fork of American River.

From Colfax Folio U. S. Geological Atlas.

There is not the slightest doubt that a river corresponding roughly to the present Middle Fork of the American had its source near Castle Peak, thence flowed across to Soda Springs and approximately followed the present Middle Fork, entering this (Colfax) quadrangle under the ridge between Long canyon and the Middle Fork, and in the southern portion of this ridge curving into the Placerville quadrangle. It entered the Colfax quadrangle again a few miles west of this, and the channel emerged from under the volcanic capping at Ralston's. A tributary from the Duncan Peak region joined it with a general southerly direction. From Ralston's much of it is eroded, but it may be regarded as certain that the main channel continued westward, touching Michigan Bluff and Sage hill, here receiving an important tributary running nearly due south from Damascus. The deposits of this latter channel are preserved below the lava ridge between Damascus and Gas Hill. Near the latter point it receives a tributary from Last Chance and Deadwood.

Again, east [west.—Ed.] of Michigan Bluff the channel is eroded; but it is certain that its continuation is found at Bath, whence the main channel ran through to Mayflower. Here it made a wide curve and ran southward to Forest Hill and the Dardanelles. Thus far the general course is outlined without uncertainty, but from here on the difficulties begin. This main channel is marked by its heavy deposits of gravel and clay and its broad, well-defined channel. Under the southwestern prolongation of the Forest Hill lava ridge nothing has thus far been found which would indicate that the main old river channel flowed down in this direction. It is true that a narrow channel of the intervulcanic epoch continues down in this direction; but these channels were notably independent of the older and main drainage basins. The intervulcanic channels were excavated after a large part of the old river basins had been filled by accumulations of silt and volcanic mud, and probably also after the tilting of the Sierra Nevada had taken place. Their direction, then, offer no criterion of the pre-volcanic drainage lines. It would certainly seem as if some fragments of the accumulations of the old channels would have been preserved southwest of the Dardanelles had the channel taken this course. The gravels exposed at Todd Valley offer no solution of the problem, for they are at a higher level and evidently represent a bench filled with gravel after the clogging of the main channel.

There is, however, a solution of this problem which is advanced as having many plausible points, though it cannot be said to be free from all objections. This is that the old channel of the Forest Hill divide emerges at Yankee Jims and Georgia Hill, and that its course from there is northward to Wisconsin Hill, thence through the lava ridge and curving eastward to the Morning Star mine, thence to Iowa Hill, crossing the canyon of the present river to Indiana Hill, and from there northward to Dutch Flat, whence its course has already been established. This hypothesis, in the first place, necessitates the existence of a deep and continuous channel between Dutch Flat and Indiana Hill. That such a deep channel exists appears now very probable, and may be regarded as certain, if the developments south of Dutch Flat in Squires canyon will show the existence of a deep trough at this place, which it has been asserted was found by the explorations. One of the principal difficulties appears to be the fact that the gravel at Georgia Hill and Yankee Jims differs somewhat in character from that of the Mayflower and Forest Hill. This may be explained by the fact that the river at this point spreads over a larger and flatter bottom, which would naturally influence the character of its deposit.

The difficulty which at first glance appears to be an insuperable one, i. e., that of the grades, on closer examination converts itself into an argument in favor of this hypothesis. From the Dardanelles to Yankee Jim is a slight grade which is sufficient for the requirements. From Yankee Jims to Wisconsin Hill the channel would at present have a slight upward grade. From Wisconsin Hill to Iowa Hill it is approximately level. From Iowa Hill to Indiana Hill it has a slight southward grade, and similarly from Dutch Flat to Indiana Hill is a grade which, though slight is opposite to that which the river, according to this hypothesis, would have had.

From Yankee Jims to Dutch Flat the Neocene river would have pursued a nearly due northerly course; now it is likely that this river from Yankee Jims to Dutch Flat had originally a very slight grade northward, similar to that of the Neocene river between You Bet and North Columbia. Examinations of channels in various parts of the Sierra Nevada have

shown the occurrence of a tilting movement which has affected the grades of the channels according to their direction. Channels running north-northwest to south-southwest would retain their original slight grade. Those running west of this line would have their grades materially increased by the tilting. On the other hand, those flowing in a more or less easterly direction from this axis of tilting would have their grade decreased or even reversed. A close examination of the elevations of Indiana Hill, Dutch Flat, Iowa Hill, Wisconsin Hill and Yankee Jims, will show that in fact the present level character or slight southward grade of these channels is exactly what would follow if the Neocene river, with a northerly course, had participated in a westward tilting of the block of the Sierra Nevada amounting to about 60 or 70 feet per mile.

If this hypothesis be true, it solves in an exceedingly satisfactory way a number of the perplexing problems which were presented by the enormous accumulation of gravels in the drainage of the old Yuba river. It increases vastly the watershed of the Neocene stream, which as now outlined extends from the headwaters of the North Fork to the Yuba. The waters of all this territory found an outlet through the narrow channel from North San Juan to Smartsville. In the central part of this drainage area longitudinal depressions existed, bordered on the west by the high diabase ridges of the foothills. All these conditions naturally tended greatly to increase the accumulation of gravels. What has formerly been supposed to be the North Fork of the Neocene American river now becomes the South Fork of the great Neocene Yuba river. The Neocene American river is reduced in size and consists only of the stream coming down from Pyramid Peak by way of Placerville.

[The hypothesis suggested by the writer seems insufficiently sustained by facts to warrant the change from the opinion expressed by him some years ago in a publication entitled "Two Neocene Rivers of California." The tilting which would have the effect on the old gradients which he has described, undoubtedly has taken place. There is much geological evidence to sustain it. The area west and southwest of the Dardanelles mine has not been explored beneath the lava. In that mine the old Neocene channel turned northwest, but is cut across almost at the beginning of the turn by an intervulcanic channel running southeast at the point of crossing, but which must within a short distance turn west or northwest. The old Neocene channel has not been connected across this cut, no effort having been made to that end. So far the writer's theory is not negated. But 2 miles southwest of the Dardanelles, at Spring Garden, there are channel remnants, long since mined out, that possess the characteristic physical appearance of the old Neocene channel. They are fragmentary, but there is no reason why the intervulcanic channel could not have as completely eroded and occupied the situs of the old Neocene channel as the existing channels have eroded and occupied the lines of both the old Neocene and its intervulcanic successors. At Jones Hill, 3 miles farther south, is another remnant of an old Neocene river bed. Physically, it belongs to the main Neocene channel, just as the remnants at Spring Garden do. Whether or not the old Neocene channel was as richly gold-bearing as in the Dardanelles and other mines above, is a question aside from the identity of the old channel line of flow. Mr. Lindgren does not in his statement in the Colfax Folio break down the logic of his other statement in "Two Neocene Rivers." The best that can be said for the hypothesis he now advances is that it is possible.—Ed.]

PROF. GEORGE T. WRIGHT of Oberlin College, Ohio, recently returned from geological explorations in northern Siberia, says there are no marks of the glacial period in that country. [Probably the reference is to such glaciation as the ice movement has left on the rocks of Ohio and other Eastern States. Mining engineers who have been to the same country have confirmed this in papers specially prepared for this paper, but have pointed out as well that there were other evidences than marks of ice movement, which indicated that the Glacial period covered Siberia with ice just exactly as it covered northern Europe and northern America.—Ed.]

THE State of Texas has appropriated \$10,000 a year for two years to have made a geological and mineralogical survey of the school lands belonging to the State. The regents of the State University have charge of the work. Persons employed in the survey must have had five years experience in chemistry, geology and mineralogy. The statistics and information gathered are to be published. A penalty is provided for the disclosure of any information obtained during the work except through publications for the general benefit.

\* T. A. LYONS in *Electromagnetic Phenomena and Deviations of the Compass*.

## The Wonderful Becquerel Ray.

Written for the MINING AND SCIENTIFIC PRESS by  
EDWARD BOOTH.

A recent telegram from Washington announced that the State Department had just received official information from Germany that recent investigations were in progress at Berlin on the "Becquerel ray." The telegram refers to the "Becquerel ray" as somewhat similar to the celebrated Roentgen or X rays, and says "the experiments are said to have disclosed the fact that an entirely new element is responsible for the Becquerel rays, and that they render almost every transparent substance luminous in the darkness. The new rays make it possible to tell genuine diamonds from artificial ones in the dark. The experiments, it is stated, also have demonstrated that rays emanating from a large quantity of the new element make the air such a conductor of electricity as to promise that the property can be utilized in wireless telegraphy."

Whether the Becquerel rays can ever be used in the practical way indicated by the above telegram remains to be determined. Perhaps the experiments now in progress at Berlin may lead to some such results. But, whether they do or not, the fact remains that the discovery of the Becquerel rays furnished another problem for scientists to solve; and, although many explanations have been suggested, it still remains unsolved.

As the Washington telegram says, the Becquerel rays are somewhat similar to the Roentgen ray, and their discovery resulted from investigations conducted to determine the characteristics of these latter rays. It is only a few years ago that the discovery of the Roentgen ray astounded the world. The first telegrams announcing that the coins inside a purse had been photographed by this new ray, that it was able to penetrate many opaque materials, was received with incredulity except by the very few who knew of previous work in this direction. And when it was found that not only could a living man's skeleton be photographed, but that it could be actually looked at and its imperfections investigated, it seemed as if the limit in this direction had been reached.

Henri Becquerel, the eminent French scientist, was one of those who became profoundly interested in these discoveries. The Roentgen rays are given off when an electrical current is passed through a vessel from which nearly all the air has been removed. Ordinary air is an extremely poor conductor of electricity—almost an absolute non-conductor—but when it becomes rarified it allows the passage of the current much more readily. The current passing through these vessels of rarified air (technically called Crooke's tubes) emits comparatively little light, but gives off in great abundance these non-luminous Roentgen rays, which have a chemical effect similar to the light rays in the silver salts and consequently make photography by this means possible. These are the rays that pass through many opaque substances and that have already proved of inestimable value in medicine.

These rays have the property of making many substances fluorescent. Fluorescence is very similar to phosphorescence, the substance possessing it having peculiar luminous properties. It was while investigating this latter property that Becquerel found that the element uranium had the property of giving out rays with nearly all the properties of the Roentgen rays. The peculiar fluorescent properties of the uranium salts have long been known, and have been used in a practical way in glass making, where a yellow uranium glass with a greenish opalescence has often been employed for ornamental purposes. But Becquerel was the first to ascertain that this fluorescent property was inherent to the element itself, and that it was more strongly manifested in the pure element than in any of its compounds. This peculiar property was found not to consist merely in the visible manifestations, but to have a far deeper power. It was found that if uranium or its compounds were taken into a photographer's dark room, and placed on a sensitive paper, which had previously been wrapped in black light-proof covering, the paper would in the course of a few hours be affected as if it had been exposed to the light. That is to say, uranium gives off rays having the same power as the Roentgen rays, of penetrating opaque materials.

Moreover, one of the most notable characteristics of the Roentgen ray is its ability to make air and other gases good conductors of electricity. As stated above, air under ordinary conditions is a non-conductor. But, when subjected to the action of the Roentgen ray, its character in this respect is completely changed and it becomes a good conductor. The rays from uranium were found to have this property, also—another point of similarity with the Roentgen ray.

The discovery of these peculiar rays—which were promptly named after their discoverer—increased the interest felt in this whole subject and was quickly followed by the discovery of like properties, to a less extent, in thorium, and, to a very much less extent, in tantalum.

Other investigators took up the work, and with

even more astonishing results. One of the principal sources of uranium is the mineral pitchblende, an impure oxide of uranium, containing a variety of rare elements. Two French chemists, P. Curie, and his wife, Mme. Sklodowska Curie, investigating the rays given out by the natural mineral, found them more powerful than those of pure uranium. This was in direct contradiction to the discoveries of Becquerel, who had found uranium more powerful than any of its compounds. The only explanation that could be suggested was that, besides uranium, pitchblende must contain some element still more active. After considerable work, the Curies succeeded in obtaining what they claim to be two new elements. One, which resembles bismuth very closely, they named polonium, after Poland, the native land of Mme. Curie, and the other they called radium, on account of its wonderful power of emitting these curious Becquerel rays. Chemically, radium so closely resembles barium that many chemists still refuse to admit that there is any difference between them.

Subsequently another French chemist, A. Debierne, found still another active body in pitchblende, and he, claiming it to be a new element, named it actinium. It is remarkably like titanium in its chemical behavior.

So within the last four or five years three substances, claimed as new elements, have been found, each possessing this peculiar property of emitting these remarkable rays, and each of them vastly more powerful than uranium, the substance in which these rays were first discovered.

The characteristics of these Becquerel rays are these:

1. They traverse opaque objects.
2. They affect photographic plates, showing that they have chemical power.
3. They make air and other gases conductors of electricity.
4. They make various substances phosphorescent when they come in contact with them.
5. They can impart their own properties to other substances with which they have been in contact, so that these substances are able for a considerable time to give out similar rays.
6. The rays are affected by a magnet, and can in this way be turned from their true course.
7. This power is apparently an inherent property of the element, as it remains with it, notwithstanding the chemical changes to which it may be subjected.
8. This power does not depend on any previous exposure to light, as in the case of ordinary phosphorescent substances. These radio-active materials have the same effect on photographic plates after having been kept for months or for years in the dark.

Many of these properties are possessed also by the Roentgen or X ray; but a few seem to be peculiar to the Becquerel rays. The inexplicable feature is that these new elements, if elements they be, have the power of emitting a vast amount of energy, and as yet it has not been ascertained where they get it or how they give it out. It is a well known natural law that energy cannot be either created or destroyed—that it is indestructible. The energy given out by polonium, or radium, or actinium, must come from somewhere. But where? That is the question yet requiring an answer.

It is easy to measure the strength of these substances by taking advantage of their power of making the air a conductor of electricity. Two ordinary conductors separated by an air space are used. As long as the air is in its ordinary state no current will pass. When a radio-active substance is placed on one of the conductors the air obtains its new power, the current passes and its strength, measured in the ordinary way, is a measure of the activity of the tested material. In this way radium has been found to possess a power 50,000 times that of uranium.

The most recent investigations on this subject have just been published by Henri Becquerel in the *Comptes Rendus* of a month ago. A brief statement of his results will show the remarkable character of these rays. He took a solid block of lead, about a quarter of an inch thick, a little more than 1 inch long and a little less than 1 inch wide. In the middle of one of the large faces of this block he cut a groove about as large as would be needed to furnish a bed for an ordinary-sized pin. This groove he filled with radium compound. That is to say, he took the smallest pinch of his radio-active material and placed it on a lead block a quarter of an inch thick. This block he then placed on a package of photographic plates that had been previously wrapped in black paper. He allowed it to remain for forty-eight hours, and, on developing the plates, found that three of them were affected, the upper two showing with distinctness the outline of the block, the lower one showing it in a more hazy way. That is, the rays from this mere pinch of material had passed through at least a quar-

ter of an inch of solid lead and through the ordinary light-proof paper and had still retained their wonderful power.

Various theories have been advanced in explanation of these rays, but so far they are all mere theories. Perhaps the commission now engaged in the investigation in Berlin will be able to throw light on the matter.

### Mica Grinding Mill.

The increase in the use of ground mica has made a demand for special machinery for doing the grinding. The process of making mica flour, or ground mica, is as follows: First, the mica as it comes from the mine is sorted, some of the large pieces being sorted and split into isinglass. The trimmings of these and the small pieces are thoroughly washed in a special machine and ground in the mica mill until it is in the form of a paste. It is then drawn off into pans, dried, crushed, reground in a dry buhr mill and finally bolted, as is done with flour. This ground mica is used, among other uses, especially in the manufacture of fine wall paper. The cut shows a

special mill, manufactured by C. O. Bartlett & Co. of 43 Center street, Cleveland, Ohio, for grinding mica in a wet or paste form. A special buhr stone is dressed on the sides and bottom, to which is fastened a heavy flange or driver attached to an upright shaft carrying a pulley. This stone is made to revolve rapidly in a lined frame and the grinding is done both in the bottom and on the sides. To the top of the upright shaft or spindle is attached a heavy ball bearing suspended by a chain and hand wheel, so that the pressure of the stone in the grinding tub can be controlled at will by raising or lowering the stone.

### Recovery of Cyanide.

TO THE EDITOR:—I think the statement in "Concentrates" in the issue of the 20th, that "cyanide might be precipitated by zinc sulphate, but that it is believed to be too expensive," might be amended by saying that in the majority of cases any process to recover cyanide would be too expensive to warrant the erection of a recovery plant. There are many plants running in which the total consumption of cyanide is less than one pound per ton of pulp treated. It can, therefore, be easily understood that the margin for the profitable recovery of cyanide in these instances is very small.

There are, however, cases which may be called "exceptional," where a stronger solution of cyanide is used, or where the solution becomes "fouled" by the presence of copper, etc. In these cases the recovery of cyanide would be profitable and its being economically accomplished might make good the difference between a loss and a profit for the treatment. Some years ago I patented the "zinc sulphate" method (U. S. patent No. 548,058, of 1895). Briefly stated, this process consists in precipitating the cyanide solution with zinc sulphate. The precipitate of zinc cyanide, etc., is then placed in a still, sulphuric acid added and the hydrocyanic acid

evolved absorbed in caustic soda, forming alkaline cyanide again. The zinc sulphate remaining in the still can then be used to precipitate more cyanide solution. Sulphuric acid and caustic alkali, therefore, are the only chemicals consumed in the process, so that the cost is low and should not exceed 15 cents per pound of cyanide consumed.

This process was tried experimentally at a tailings plant in Arizona, where the accumulation of copper in the solution had given us a great deal of trouble. It worked perfectly, but as the consumption of cyanide was less than one and one-half pounds per ton of tailings the owners did not think it was worth while going to the expense of erecting a permanent recovery plant.

The value of a recovery process depends on the price of cyanide, and when that is less than 30 cents a pound the margin for profitable recovery is not at all large, except under very unusual circumstances, where comparatively strong solutions of cyanide are used.

BERTRAM HUNT.

San Francisco, April 20.

There are some exceptional cases where the cyanide process is used where as much as \$3.50 cost of cyanide is employed per ton of tailings treated. It would seem that a recovery of the cyanide at a rate of one-half this sum would prove quite profitable.—Ed.]

## ing and Metallurgical Patents.

Patents Issued April 23, 1901.

pecially Prepared for the MINING AND SCIENTIFIC PRESS.

ALGAMATOR.—No. 672,740; L. Mayhew, Newcom, Wash.

having dish portions 14; riffle plate 16, mounted upon each bottom 14; well extending full length of pan; hopper having its lower end fitted within well to form side passages for material between it and well walls, bottom of hopper being of an inverted dish shape, hopper having extending its full length; and series of plates fixedly connected to hopper, partitions forming transverse partitions extending full transverse area of panning spaces above hopper 14, having pendent members adapted to spaces and having foot portions extending under dish bottom of hopper, foot portions means for supporting hopper within well and partitions being detachably mounted within well.

METHOD OF BREAKING ROCK.—No. 672,616; T. A. Edison, Llewellyn Park, N. J.

Method of breaking rock consisting in driving pair of independently driven and disconnected massive rolls at high speed by means of small power capable of running rolls up to speed when no work is being

done, partially arresting the motion of rolls by successively and periodically delivering charges of rock to them, thereby breaking rock by kinetic energy, and restoring speed of rolls during the intervals.

MEANS FOR CASTING INGOTS.—No. 672,447; A. J. Lustig, Newark, N. J.

Ingot mold, mold support, consisting essentially of chambered base, having internal supporting ribs, a loose material, which is a non-conductor of heat in base plate or foundation, means for conducting reducing gas into same, mold support on ribs, having gas passages or ducts, supporting plate having central depression, and plate therein made of refractory material, all arranged for support of ingot mold and for retaining gas in base while mold is cold, but permit it to pass through supports when heated by molten metal, and frame-like receptacle having perforations and constructed to contain a carbonaceous material, arranged upon mold support.

AMALGAMATOR.—No. 672,524; G. Ghiglieri and J. M. Schofield, Stockton, Cal.

A stationary frame, a suspended tray provided with fixed partitions and depending post, series of amalgam rollers and aprons suspended in tray; in combination with driving shaft, gear wheel fixed thereon and wrist pin carried by gear wheel, a countershaft and crank and pinion fixed on countershaft, pinion being in mesh with gear wheel, a crank lever fulcrumed in frame and having one arm operatively connected to crank and the other to tray.

AMALGAMATOR.—No. 672,739; L. Mayhew, New Whatcom, Wash.

Pan having fixedly held vessel in nature of pan having central well and side portions having dish bottom, flange 5, projected up from dish bottom, and an inner vessel comprising cylinder 6, of less diameter than well, cylinder being adapted to fit in well, whereby vertical discharge passage is produced between wall of well and cylinder, inner vessel also including an inverted cone-shaped hopper 9, lower end of which terminates above bottom of well; in combination with series of partition plates, each comprising upper outwardly extending member 10, adapted to rest upon dish bottom and abut flange 5, a vertical member 10<sup>a</sup>, adapted to extend down and fit within discharge passage between cylinder 6 and well wall, member 10<sup>a</sup>, being of length to extend down and rest upon bottom of well, member 10<sup>a</sup>, terminating in inwardly extending seat portion 10<sup>b</sup>, which forms a rest for bottom of cylinder 6, member 10<sup>a</sup>, merging with member 10<sup>b</sup>, that extends upward into cylinder 6, and has inner edge arranged to engage and form seat for lower end of cone member 9, and means for holding several plates 10 in their proper vertical positions.

PROCESS OF TREATING ZINC-BEARING ORES FOR OBTAINING ZINC, ETC.—No. 672,637; S. O. Cowper-Coles, London, England.

The treatment of complex zinc ores, such as those known as Broken Hill ore, consisting in first roasting, crushing and screening ore, placing it in vats and washing with water, afterward run into an evaporating pan, leaching ore with a weak solution of sulphuric acid to abstract zinc and copper, passing solution containing zinc sulphate and copper sulphate through a body of carbon and an electrolytic positive metal to recover copper, electrolyzing re-

maining solution to recover zinc, again washing ore with water which is afterward also run into evaporating pan, treating ore with a solution of caustic soda to extract lead in form of sodium plumbate, electrolyzing solution to recover metallic lead, and leaching remaining ore in vats with potassium cyanide and subsequently electrolyzing solution to recover metallic silver and gold.

FLUID PRESSURE TURBINE.—No. 672,838; F. Hodgkinson, Wilkesburg, Pa.

One of the blade supporting members of which is provided with undercut grooves and laterally offset insertion recesses and with sets of blades or vanes having integral base blocks that are removably fitted into and completely fill grooves, and locking blocks fitting into recesses.

PROCESS OF WELDING ALUMINUM AND ALUMINUM ALLOYS.—No. 672,744; M. Schmidt, Berlin, Germany.

Welding aluminum and aluminum alloys consisting in applying to heated edges of aluminum a solid body of high fusion point which forms part of an electric circuit that includes parts to be welded and moving body along between edges for purpose of removing oxide therefrom both mechanically and electrolytically.

## Tamping in Blasting.

TO THE EDITOR:—I read an article recently in the MINING AND SCIENTIFIC PRESS in regard to tamping dynamite in blasting holes, in which the writer asks if it is necessary, and, if so, why? In a varied experience of twenty years in Montana, I spent eight of them in working as a quartz miner, and I have often asked the same question as the writer, and, where the answer was in favor of tamping, I always failed to get a satisfactory reason in support of that theory. I have always maintained that tamping of any kind on dynamite or giant powder was superfluous, and have proved my theory on many occasions in working with partners who insisted that tamping was necessary to obtain the full effect of the powder. As far as could be judged, the visible effect was the same in all kinds of rock, with the powder tamped or untamped. My mining experience commenced without any prejudice in this matter, engendered by a former use of black powder, and I am inclined to think that this is the reason why so many miners of long experience still cling to the habit of tamping, it having become a habit through the use of the black powder.

While it has been my experience that not one valid reason can be advanced why dynamite should be tamped, there are many reasons why it should not. First and foremost, safety to the workman; missed holes are a common occurrence, and very little risk is encountered in going into a missed hole that is not tamped, as it is only a second's work to remove the fuse and cap and insert another. This reason alone is sufficient to commend the practice to any intelligent miner. I will state that it is my practice to insert a rag in the mouth of the hole, in order to hold the fuse and also to keep the dirt from filling the hole. There is also a large saving of time in loading a round of holes.

I have worked in all kinds of rock, used both fuse and battery in discharging, and have always found that the amount of work done compared well with that of miners wedded to the tamping theory. My experience with explosives has been limited to that known as giant powder, Nos. 1, 2 and 3, mainly No. 2. I would like very much to hear the views of other miners in this matter.

R. H. BEMIS.

Belt, Mont., April 27.

THE comparative costs of manufacture of iron and steel in Great Britain using Bilbao (Spanish) ore, and America using Lake Superior ore, work out approximately as follows, at the average normal price paid for ore, coal and wages per ton of 2240 pounds: Britain, with Bilbao ore at \$3.62 at the furnace: Ore, two tons 50% to 55% iron at \$3.62, \$7.24; coke, 1.25 tons at \$2.42, \$3.03; limestone, labor, coal, repairs, etc., \$1.81; total, \$12.08; conversion into rails, bars, etc., \$6.05, making \$18.13. America, with ore at \$2.42 at the furnace: Ore, 65%, 1.75 tons at \$2.42, \$4.23; coke, .8 ton at \$1.81, \$1.45; limestone, labor, etc., \$1.51; total, \$7.19; conversion into rails, etc., \$4.84, making \$12.03.—E. Phillips in The Engineering Magazine.

It is proposed on the electric railway between Berlin and Hamburg to obtain speeds of 125 to 150 miles an hour for passenger trains, but freight trains will be moved by steam as before. The passenger cars will be dispatched singly at intervals of ten minutes and will make the journey in a little over an hour.

## The Wonderful Becquerel Ray.

Written for the MINING AND SCIENTIFIC PRESS by  
EDWARD BOOTH.

A recent telegram from Washington announced that the State Department had just received official information from Germany that recent investigations were in progress at Berlin on the "Becquerel ray." The telegram refers to the "Becquerel ray" as somewhat similar to the celebrated Roentgen or X rays, and says "the experiments are said to have disclosed the fact that an entirely new element is responsible for the Becquerel rays, and that they render almost every transparent substance luminous in the darkness. The new rays make it possible to tell genuine diamonds from artificial ones in the dark. The experiments, it is stated, also have demonstrated that rays emanating from a large quantity of the new element make the air such a conductor of electricity as to promise that the property can be utilized in wireless telegraphy."

Whether the Becquerel rays can ever be used in the practical way indicated by the above telegram remains to be determined. Perhaps the experiments now in progress at Berlin may lead to some such results. But, whether they do or not, the fact remains that the discovery of the Becquerel rays furnished another problem for scientists to solve; and, although many explanations have been suggested, it still remains unsolved.

As the Washington telegram says, the Becquerel rays are somewhat similar to the Roentgen ray, and their discovery resulted from investigations conducted to determine the characteristics of these latter rays. It is only a few years ago that the discovery of the Roentgen ray astounded the world. The first telegrams announcing that the coins inside a purse had been photographed by this new ray, that it was able to penetrate many opaque materials, was received with incredulity except by the very few who knew of previous work in this direction. And when it was found that not only could a living man's skeleton be photographed, but that it could be actually looked at and its imperfections investigated, it seemed as if the limit in this direction had been reached.

Henri Becquerel, the eminent French scientist, was one of those who became profoundly interested in these discoveries. The Roentgen rays are given off when an electrical current is passed through a vessel from which nearly all the air has been removed. Ordinary air is an extremely poor conductor of electricity—almost an absolute non-conductor—but when it becomes rarified it allows the passage of the current much more readily. The current passing through these vessels of rarified air (technically called Crooke's tubes) emits comparatively little light, but gives off in great abundance these non-luminous Roentgen rays, which have a chemical effect similar to the light rays in the silver salts and consequently make photography by this means possible. These are the rays that pass through many opaque substances and that have already proved of inestimable value in medicine.

These rays have the property of making many substances fluorescent. Fluorescence is very similar to phosphorescence, the substance possessing it having peculiar luminous properties. It was while investigating this latter property that Becquerel found that the element uranium had the property of giving out rays with nearly all the properties of the Roentgen rays. The peculiar fluorescent properties of the uranium salts have long been known, and have been used in a practical way in glass making, where a yellow uranium glass with a greenish opalescence has often been employed for ornamental purposes. But Becquerel was the first to ascertain that this fluorescent property was inherent to the element itself, and that it was more strongly manifested in the pure element than in any of its compounds. This peculiar property was found not to consist merely in the visible manifestations, but to have a far deeper power. It was found that if uranium or its compounds were taken into a photographer's dark room, and placed on a sensitive paper, which had previously been wrapped in black light-proof covering, the paper would in the course of a few hours be affected as if it had been exposed to the light. That is to say, uranium gives off rays having the same power as the Roentgen rays, of penetrating opaque materials.

Moreover, one of the most notable characteristics of the Roentgen ray is its ability to make air and other gases good conductors of electricity. As stated above, air under ordinary conditions is a non-conductor. But, when subjected to the action of the Roentgen ray, its character in this respect is completely changed and it becomes a good conductor. The rays from uranium were found to have this property, also—another point of similarity with the Roentgen ray.

The discovery of these peculiar rays—which were promptly named after their discoverer—increased the interest felt in this whole subject and was quickly followed by the discovery of like properties, to a less extent, in thorium, and, to a very much less extent, in tantalum.

Other investigators took up the work, and with

even more astonishing results. One of the principal sources of uranium is the mineral pitchblende, an impure oxide of uranium, containing a variety of rare elements. Two French chemists, P. Curie, and his wife, Mme. Sklodowska Curie, investigating the rays given out by the natural mineral, found them more powerful than those of pure uranium. This was in direct contradiction to the discoveries of Becquerel, who had found uranium more powerful than any of its compounds. The only explanation that could be suggested was that, besides uranium, pitchblende must contain some element still more active. After considerable work, the Curies succeeded in obtaining what they claim to be two new elements. One, which resembles bismuth very closely, they named polonium, after Poland, the native land of Mme. Curie, and the other they called radium, on account of its wonderful power of emitting these curious Becquerel rays. Chemically, radium so closely resembles barium that many chemists still refuse to admit that there is any difference between them.

Subsequently another French chemist, A. Debierne, found still another active body in pitchblende, and he, claiming it to be a new element, named it actinium. It is remarkably like titanium in its chemical behavior.

So within the last four or five years three substances, claimed as new elements, have been found, each possessing this peculiar property of emitting these remarkable rays, and each of them vastly more powerful than uranium, the substance in which these rays were first discovered.

The characteristics of these Becquerel rays are these:

1. They traverse opaque objects.
2. They affect photographic plates, showing that they have chemical power.
3. They make air and other gases conductors of electricity.
4. They make various substances phosphorescent when they come in contact with them.
5. They can impart their own properties to other substances with which they have been in contact, so that these substances are able for a considerable time to give out similar rays.
6. The rays are affected by a magnet, and can in this way be turned from their true course.
7. This power is apparently an inherent property of the element, as it remains with it, notwithstanding the chemical changes to which it may be subjected.
8. This power does not depend on any previous exposure to light, as in the case of ordinary phosphorescent substances. These radio-active materials have the same effect on photographic plates after having been kept for months or for years in the dark.

Many of these properties are possessed also by the Roentgen or X ray; but a few seem to be peculiar to the Becquerel rays. The inexplicable feature is that these new elements, if elements they be, have the power of emitting a vast amount of energy, and as yet it has not been ascertained where they get it or how they give it out. It is a well known natural law that energy cannot be either created or destroyed—that it is indestructible. The energy given out by polonium, or radium, or actinium, must come from somewhere. But where? That is the question yet requiring an answer.

It is easy to measure the strength of these substances by taking advantage of their power of making the air a conductor of electricity. Two ordinary conductors separated by an air space are used. As long as the air is in its ordinary state no current will pass. When a radio-active substance is placed on one of the conductors the air obtains its new power, the current passes and its strength, measured in the ordinary way, is a measure of the activity of the tested material. In this way radium has been found to possess a power 50,000 times that of uranium.

The most recent investigations on this subject have just been published by Henri Becquerel in the Comptes Rendus of a month ago. A brief statement of his results will show the remarkable character of these rays. He took a solid block of lead, about a quarter of an inch thick, a little more than 1 inch long and a little less than 1 inch wide. In the middle of one of the large faces of this block he cut a groove about as large as would be needed to furnish a bed for an ordinary-sized pin. This groove he filled with radium compound. That is to say, he took the smallest pinch of his radio-active material and placed it on a lead block a quarter of an inch thick. This block he then placed on a package of photographic plates that had been previously wrapped in black paper. He allowed it to remain for forty-eight hours, and, on developing the plates, found that three of them were affected, the upper two showing with distinctness the outline of the block, the lower one showing it in a more hazy way. That is, the rays from this mere pinch of material had passed through at least a quar-

ter of an inch of solid lead and through the ordinary light-proof paper and had still retained their wonderful power.

Various theories have been advanced in explanation of these rays, but so far they are all mere theories. Perhaps the commission now engaged in the investigation in Berlin will be able to throw light on the matter.

## Mica Grinding Mill.

The increase in the use of ground mica has made a demand for special machinery for doing the grinding. The process of making mica flour, or ground mica, is as follows: First, the mica as it comes from the mine is sorted, some of the large pieces being sorted and split into isinglass. The trimmings of these and the small pieces are thoroughly washed in a special machine and ground in the mica mill until it is in the form of a paste. It is then drawn off into pans, dried, crushed, reground in a dry buhr mill and finally bolted, as is done with flour. This ground mica is used, among other uses, especially in the manufacture of fine wall paper. The cut shows a

special mill, manufactured by C. O. Bartlett & Co. of 43 Center street, Cleveland, Ohio, for grinding mica in a wet or paste form. A special buhr stone is dressed on the sides and bottom, to which is fastened a heavy flange or driver attached to an upright shaft carrying a pulley. This stone is made to revolve rapidly in a lined frame and the grinding is done both in the bottom and on the sides. To the top of the upright shaft or spindle is attached a heavy ball bearing suspended by a chain and hand wheel, so that the pressure of the stone in the grinding tub can be controlled at will by raising or lowering the stone.

## Recovery of Cyanide.

TO THE EDITOR:—I think the statement in "Concentrates" in the issue of the 20th, that "cyanide might be precipitated by zinc sulphate, but that it is believed to be too expensive," might be amended by saying that in the majority of cases any process to recover cyanide would be too expensive to warrant the erection of a recovery plant. There are many plants running in which the total consumption of cyanide is less than one pound per ton of pulp treated. It can, therefore, be easily understood that the margin for the profitable recovery of cyanide in these instances is very small.

There are, however, cases which may be called "exceptional," where a stronger solution of cyanide is used, or where the solution becomes "fouled" by the presence of copper, etc. In these cases the recovery of cyanide would be profitable and its being economically accomplished might make good the difference between a loss and a profit for the treatment. Some years ago I patented the "zinc sulphate" method (U. S. patent No. 548,058, of 1895). Briefly stated, this process consists in precipitating the cyanide solution with zinc sulphate. The precipitate of zinc cyanide, etc., is then placed in a still, sulphuric acid added and the hydrocyanic acid

evolved absorbed in caustic soda, forming alkaline cyanide again. The zinc sulphate remaining in the still can then be used to precipitate more cyanide solution. Sulphuric acid and caustic alkali, therefore, are the only chemicals consumed in the process, so that the cost is low and should not exceed 15 cents per pound of cyanide consumed.

This process was tried experimentally at a tailings plant in Arizona, where the accumulation of copper in the solution had given us a great deal of trouble. It worked perfectly, but as the consumption of cyanide was less than one and one-half pounds per ton of tailings the owners did not think it was worth while going to the expense of erecting a permanent recovery plant.

The value of a recovery process depends on the price of cyanide, and when that is less than 30 cents a pound the margin for profitable recovery is not at all large, except under very unusual circumstances, where comparatively strong solutions of cyanide are used.

BERTRAM HUNT.

San Francisco, April 20.

[There are some exceptional cases where the cyanide process is used where as much as \$3.50 cost of cyanide is employed per ton of tailings treated. It would seem that a recovery of the cyanide at a charge of one-half this sum would prove quite profitable.—Ed.]

## Mining and Metallurgical Patents.

Patents Issued April 23, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

AMALGAMATOR.—No. 672,740; L. Mayhew, New Whatcom, Wash.

A pan having dish portions 14; riffle plate 16, adjustably mounted upon each bottom 14; well extending full length of pan; hopper having its lower portion fitted within well to form side passages for outflow between it and well walls, bottom of hopper being made of an inverted dish shape, hopper having discharge extending its full length; and series of partition plates fixedly connected to hopper, plates having portions forming transverse partitions extending full transverse area of panning spaces above pan portions 14, having pendent members adapted to fit outflow spaces and having foot portions extending inwardly under dish bottom of hopper, foot portions forming means for supporting hopper within well, hopper and partitions being detachably mounted within well.

METHOD OF BREAKING ROCK.—No. 672,616; T. A. Edison, Llewellyn Park, N. J.

Method of breaking rock consisting in driving pair of independently driven and disconnected massive rolls at high speed by means of small power capable of running rolls up to speed when no work is being

done, partially arresting the motion of rolls by successively and periodically delivering charges of rock to them, thereby breaking rock by kinetic energy, and restoring speed of rolls during the intervals.

MEANS FOR CASTING INGOTS.—No. 672,447; A. J. Lustig, Newark, N. J.

Ingot mold, mold support, consisting essentially of chambered base, having internal supporting ribs, a loose material, which is a non-conductor of heat in base plate or foundation, means for conducting reducing gas into same, mold support on ribs, having gas passages or ducts, supporting plate c having central depression, and plate therein made of refractory material, all arranged for support of ingot mold and for retaining gas in base while mold is cold, but permit it to pass through supports when heated by molten metal, and frame-like receptacle having perforations and constructed to contain a carbonaceous material, arranged upon mold support.

AMALGAMATOR.—No. 672,524; G. Ghiglieri and J. M. Schofield, Stockton, Cal.

A stationary frame, a suspended tray provided with fixed partitions and depending post, series of amalgam rollers and aprons suspended in tray; in combination with driving shaft, gear wheel fixed thereon and wrist pin carried by gear wheel, a countershaft and crank and pinion fixed on countershaft, pinion being in mesh with gear wheel, a crank lever fulcrumed in frame and having one arm operatively connected to crank and the other to tray.

AMALGAMATOR.—No. 672,739; L. Mayhew, New Whatcom, Wash.

Pan having fixedly held vessel in nature of pan having central well and side portions having dish bottom, flange 5, projected up from dish bottom, and an inner vessel comprising cylinder 6, of less diameter than well, cylinder being adapted to fit in well, whereby vertical discharge passage is produced between wall of well and cylinder, inner vessel also including an inverted cone-shaped hopper 9, lower end of which terminates above bottom of well; in combination with series of partition plates, each comprising upper outwardly extending member 10, adapted to rest upon dish bottom and abut flange 5, a vertical member 10<sup>a</sup>, adapted to extend down and fit within discharge passage between cylinder 6 and well wall, member 10<sup>a</sup>, being of length to extend down and rest upon bottom of well, member 10<sup>a</sup>, terminating in inwardly extending seat portion 10<sup>b</sup>, which forms a rest for bottom of cylinder 6, member 10<sup>a</sup>, merging with member 10<sup>b</sup>, that extends upward into cylinder 6, and has inner edge arranged to engage and form seat for lower end of cone member 9, and means for holding several plates 10 in their proper vertical positions.

PROCESS OF TREATING ZINC-BEARING ORES FOR OBTAINING ZINC, ETC.—No. 672,637; S. O. Cowper-Coles, London, England.

The treatment of complex zinc ores, such as those known as Broken Hill ore, consisting in first roasting, crushing and screening ore, placing it in vats and washing with water, afterward run into an evaporating pan, leaching ore with a weak solution of sulphuric acid to abstract zinc and copper, passing solution containing zinc sulphate and copper sulphate through a body of carbon and an electro-positive metal to recover copper, electrolyzing re-

maining solution to recover zinc, again washing ore with water which is afterward also run into evaporating pan, treating ore with a solution of caustic soda to extract lead in form of sodium plumbate, electrolyzing solution to recover metallic lead, and leaching remaining ore in vats with potassium cyanide and subsequently electrolyzing solution to recover metallic silver and gold.

FLUID PRESSURE TURBINE.—No. 672,838; F. Hodgkinson, Wilkesburg, Pa.

One of the blade supporting members of which is provided with undercut grooves and laterally offset insertion recesses and with sets of blades or vanes having integral base blocks that are removably fitted into and completely fill grooves, and locking blocks fitting into recesses.

PROCESS OF WELDING ALUMINUM AND ALUMINUM ALLOYS.—No. 672,744; M. Schmidt, Berlin, Germany.

Welding aluminum and aluminum alloys consisting in applying to heated edges of aluminum a solid body of high fusion point which forms part of an electric circuit that includes parts to be welded and moving body along between edges for purpose of removing oxide therefrom both mechanically and electrolytically.

## Tamping in Blasting.

TO THE EDITOR:—I read an article recently in the MINING AND SCIENTIFIC PRESS in regard to tamping dynamite in blasting holes, in which the writer asks if it is necessary, and, if so, why? In a varied experience of twenty years in Montana, I spent eight of them in working as a quartz miner, and I have often asked the same question as the writer, and, where the answer was in favor of tamping, I always failed to get a satisfactory reason in support of that theory. I have always maintained that tamping of any kind on dynamite or giant powder was superfluous, and have proved my theory on many occasions in working with partners who insisted that tamping was necessary to obtain the full effect of the powder. As far as could be judged, the visible effect was the same in all kinds of rock, with the powder tamped or untamped. My mining experience commenced without any prejudice in this matter, engendered by a former use of black powder, and I am inclined to think that this is the reason why so many miners of long experience still cling to the habit of tamping, it having become a habit through the use of the black powder.

While it has been my experience that not one valid reason can be advanced why dynamite should be tamped, there are many reasons why it should not. First and foremost, safety to the workman; missed holes are a common occurrence, and very little risk is encountered in going into a missed hole that is not tamped, as it is only a second's work to remove the fuse and cap and insert another. This reason alone is sufficient to commend the practice to any intelligent miner. I will state that it is my practice to insert a rag in the mouth of the hole, in order to hold the fuse and also to keep the dirt from filling the hole. There is also a large saving of time in loading a round of holes.

I have worked in all kinds of rock, used both fuse and battery in discharging, and have always found that the amount of work done compared well with that of miners wedded to the tamping theory. My experience with explosives has been limited to that known as giant powder, Nos. 1, 2 and 3, mainly No. 2. I would like very much to hear the views of other miners in this matter.

R. H. BEMIS.

Belt, Mont., April 27.

THE comparative costs of manufacture of iron and steel in Great Britain using Bilbao (Spanish) ore, and America using Lake Superior ore, work out approximately as follows, at the average normal price paid for ore, coal and wages per ton of 2240 pounds: Britain, with Bilbao ore at \$3.62 at the furnace: Ore, two tons 50% to 55% iron at \$3.62, \$7.24; coke, 1.25 tons at \$2.42, \$3.03; limestone, labor, coal, repairs, etc., \$1.81; total, \$12.08; conversion into rails, bars, etc., \$6.05, making \$18.13. America, with ore at \$2.42 at the furnace: Ore, 65%, 1.75 tons at \$2.42, \$4.23; coke, .8 ton at \$1.81, \$1.45; limestone, labor, etc., \$1.51; total, \$7.19; conversion into rails, etc., \$4.84, making \$12.03.—E. Phillips in The Engineering Magazine.

It is proposed on the electric railway between Berlin and Hamburg to obtain speeds of 125 to 150 miles an hour for passenger trains, but freight trains will be moved by steam as before. The passenger cars will be dispatched singly at intervals of ten minutes and will make the journey in a little over an hour.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

Another discovery of rich gold-bearing ore is reported from Crackerjack, on Twelve-mile Arm, Prince of Wales island, near Ketchikan.

A barge load of concentrates from the Treadwell mine has been wrecked in Wrangell Narrows. It is believed that part, if not all, of the cargo will be saved.

### ARIZONA.

#### COCHISE COUNTY.

The erection of the hoist at the new combination shaft at Tombstone has been begun. The shaft will be a four-compartment one, the only one of its size in Arizona.

#### MOHAVE COUNTY.

It is said the old Juno mine at Chloride may be reopened, the company proposing the erection of a leaching or cyanide plant for treating the ores.

#### YAVAPAI COUNTY.

W. A. Lester & Co. of Fredonia, N. Y., are said to have bought thirty-eight placer claims in Big Bug district. The purchasers propose to install a steam-shovel and gold-saving plant, using water pumped from Big Bug creek.

### CALIFORNIA.

#### AMADOR COUNTY.

The Doyle mine, near Jackson, has been bonded to San Francisco parties at \$50,000, it is said. They are to begin operations by the first of June.

The Moon G. M. Co., Valley Springs, have begun work on the Mefford copper mine in Camp Opra district. They are sinking a shaft, using a whim.

The Chicago M. Co., J. E. Shettle manager, has bought the Price mine, near Plymouth, on the mother lode.

The Amador Queen D. Co. is reopening the Amador Queen No. 2 at Jackson. The mine is to be thoroughly prospected from the bottom of the 1200-foot shaft.

The Phoenix M. Co. is working the old Merrimac gravel mine, at Central Hill.

#### BUTTE COUNTY.

It is said that the Catskill drift mine at Bangor is to be reopened, the new owners putting on improved machinery and using electric power.—Nine dredgers are operating in the Feather river bed and adjacent in the old low-lying gravels between Biggs and Oroville, and several more are under construction for the same locality.

#### CALAVERAS COUNTY.

The Del Monte group at Railroad Flat, owned by the Del Monte M. & Co. of Jackson, Amador Co., B. C. O'Neill Supt., is being developed by a 220-foot shaft on the ledge and a tunnel running over 300 feet along it. The mill returns have averaged \$6.40 a ton on the plates. The company are projecting a 1000-foot tunnel to crosscut the ledges from 400 to 500 feet deep and propose to use air drills in construction.

The old Field mine, near San Andreas, has been bought by M. P. Morgan, D. C. Demarest, G. More, F. C. Benton and others, and work is to commence immediately.

The Haggerman mine, near San Andreas, has been bonded to D. A. Nuner and associates, who will develop it.

The Lone Star mill, West Point, is being repaired to start crushing. In the R. & H. tunnel at a depth of 1230 feet a new ore body has been uncovered. The vein is 4 feet wide and carries considerable sulphurets.

#### EL DORADO COUNTY.

The Schneider mine, near Placerville, has been bonded by W. C. Bryant to Hayward & Lane. W. I. Smart will be Supt.

#### HUMBOLDT COUNTY.

The croppings of a copper-bearing ledge traceable for nearly 4 miles, in Mattole valley, have been located by J. C. Hampton, G. C. Douglas and others of Eureka.

F. M. Shideler, manager of the Achison M. Co., has bought for that company the Little River beach sand mine. A new centrifugal pump and a gold-saving machine will be put in to work the sands.

#### KERN COUNTY.

The War Eagle Co. at Randsburg have a shaft down 100 feet.—The Yellow Poppy and Gray Eagle have two shafts down 106 and 160 feet. The vein is 12 feet wide and said to average \$4 a ton.—The last Big Butte clean-up is over \$10,000.—A coal vein has been struck 10 miles north of town.

Randsburg, April 30.

#### MONO COUNTY.

The Sweetwater M. & M. Co. are nego-

tiating to buy a mill for the Sayre mine, near Sweetwater. The principal value of the ore is in silver.

The Southern Con. M. Co. have begun work on the Red Cloud shaft at Bodie. W. H. Metson is secretary and treasurer.

#### NAPA COUNTY.

The 1900 report of the Boston Quicksilver Co. shows that during the year 8844 tons of ore were produced and roasted, yielding 99,000 pounds of quicksilver, .66% to the ton. The cost of production was 42%—about two-thirds of the product.

#### NEVADA COUNTY.

The Pennsylvania M. Co. and the Grass Valley Ex. Co. are each sinking a line of shafts, developing the apex lines of lodes the subject of the litigation now on in the U. S. Circuit Court of San Francisco. The work is part of the proof each party proposes to submit to the court.

A. P. Clarke, operating a placer mine at Quaker Hill, has had his mine closed down under an injunction issued out of the U. S. Court. The mine has been worked under a permit from the U. S. Debris Commissioners, and the provisions of the Act have been complied with.

A crushing of ten tons of ore from the Tilley mine, formerly the Midnight, at Nevada City, brought \$30 per ton. Mr. Tilley is projecting a mill for the mine.

The Jenny Lind M. Co. of Grass Valley has bought eighty acres of the I. L. Weed ranch on Alta hill, the addition giving the company 6500 feet length of ledge.

The St. Johns mine, at Nevada City, has been bonded for eighteen months to Dr. C. W. Jones and P. P. Ferron, who state that a San Francisco company will develop the property.

At the Nevada City mine, now operated under bond by a party of local miners, a rich shoot of ore is reported to have been struck.

#### PLACER COUNTY.

The Bonnie Bee Q. M. & Dev. Co. has incorporated to mine near Emigrant Gap. H. A. Frost, of Dutch Flat, is secretary. The company propose to install a compressor plant.

A bedrock tunnel to open the channel in the Tadpole mine near Secret House has been started.

Wm. Muir, superintending the Sacramento mine at Forest Hill, says blue gravel has been struck that prospects 20 cents per pan.

#### PLUMAS COUNTY.

Standart & McGill have resumed work on their mine below Round valley.—The Upper Dutch hydraulic mine, La Porte, has been enjoined by the Anti-Debris Association. Between thirty and forty men have been thrown out of employment. The mine was operating under a permit from the Debris Commission.

#### SAN BENITO COUNTY.

The annual report of the New Idria quicksilver mine states that during the year 20,638 tons of ore were roasted, producing 3990 flasks of quicksilver; this sold for \$140,828. Expenses were \$117,994, including \$19,172 for new construction and repairs and \$10,240 for depreciation. The percentage of quicksilver recovered was a little less than  $\frac{1}{4}$  of 1%.

#### SAN DIEGO COUNTY.

A new mining operation, in which Senators Morgan, Jones, Pettigrew and Dorsey are interested, is reported as preparing to put up a large gold mining plant at Picacho to mine low-grade gold ore. The milling plant is to be located on the west bank of the Colorado river, 5 miles from the mine. Surveyors are reported to be staking railroad lines from the mine to the mill site and from the latter to the railroad.

#### SHASTA COUNTY.

The smelting plant of the Mountain Copper Co. at Keswick is to be operated soon with electrical power. Manager L. T. Wright is reported to have contracted with the Keswick Electric Power Co., H. H. Noble of San Francisco president, for power for the entire plant. It is believed that 1500 H. P. will be necessary. The Keswick Electric Power Co. is installing a power plant on Mill Seat creek, in the Shingletown region, about 40 miles southeast of Redding. With the machinery now being taken in 6000 H. P. can be produced.

J. R. DeLamar has bonded the Globe group of copper claims near Copper City, within 3 miles of the Bully Hill plant, recently sold by him.

#### SIERRA COUNTY.

N. G. Read, of Downieville, has leased the Rising Sun mine and put men at work there.

The Sierra-Alaska G. M. Co. has incorporated to mine in Sierra county; capital stock, \$50,000. J. H. Helms, A. J. Gilbert, H. Warren, W. J. Saulsbury, T. Holdsworth, of San Francisco, are directors.

#### TRINITY COUNTY.

The Texas Jack mine, near Trinity

Center, T. F. Edmunds, owner, reports a thirty-day cleanup of \$1500. The owner operates alone, having a 3-stamp mill at the mine.

#### TUOLUMNE COUNTY.

The Free Lance mine has been bonded by W. Sharwood, Sonora, who states that a company will be organized to resume its operations.

The Gold Brick mine, at Jamestown, owned by C. E. Dorgan, J. Mangante & Co., is being developed by a shaft, which has disclosed a shoot of ore believed to be a continuation of the Crystalline.

At the Jumper mine at Stent the shaft is down 1500 feet, stoping being done from the 700-foot level upwards.

A rich strike is reported in the Hope mine at Sonora. S. Ralston and Boston people are the owners.

The Clio mine at Jacksonville is closed down pending negotiations for a sale to C. D. Lane.

In the Dreisam mine, at Arastraville, the Yellow Jacket vein has been struck on the 400 level, 2 feet thick and high grade.

#### YUBA COUNTY.

A rich strike has been made on the 1600-foot level of the Victor mine (formerly the Dannenberg) at Browns Valley. It is said that \$10,000 has been taken out of the pocket so far.

### COLORADO.

#### BOULDER COUNTY.

H. M. Russell of California has organized a company, known as the Century Co., to operate the American mine at Magnolia on an extensive scale. Among the people interested are R. L. Spencer, J. F. Hackstaff of New York, G. L. Zimmerman of Harrisburg and F. B. Dunn of St. Johns, N. B.

The Leviathan M. Co. is operating eighteen claims near Ward. The group is being developed by a tunnel now in 720 feet toward the main vein, 500 feet farther in. The company is proposing to install a compressor and drills.

#### CLEAR CREEK COUNTY.

The Centurion G. M. Co. at Idaho Springs, under management of R. Prentice & Co. of Colorado Springs, is commencing work on eleven claims and mill site. A contract will be let to drive 1000 feet of tunnel.

#### GILPIN COUNTY.

The East Nodaway, operated by the Town Topic G. M. Co., is shipping considerable high-grade ore and doing development work. M. D. Draper is Supt. Central City, April 22.

At the East Nodaway mine, Central City, twenty-five men are working, sub-leasing or tributing. Some leasers have been taking out smelting ore running from seven to eleven ounces gold per ton, leaving them good wages after paying royalty to the Town Topics M. Co. The clearing and retimbering of the shaft is now completed, down 400 feet. M. D. Draper is Supt. of the Town Topics Co.

At the West Nodaway, Central City, the 300, 350, 440 and 500 west levels are being worked. H. F. Pool is Supt. for the Nodaway G. M. Co.

F. Belcher and W. Flagler of Central City have leased the Springdale lode, formerly owned by the Gold Rock M. Co., and have commenced work.

It is said Philadelphia people are to work the Rara Avis group, which has a mill site in Eureka district, near Central City, and \$25,000 to \$30,000 is to be spent in improvements.

The Carbonate King mine, 6 miles north of Ohio City, has exposed a large body of lead ore. The company expects to begin operations soon. The ore will be shipped or else treated by a concentrating plant to be erected by the company.

#### HINSDALE COUNTY.

The Hidden Treasure mine plant at Lake City is to be overhauled this spring. The mine is now producing 100 tons of ore daily from the 800-foot shaft, which is concentrated four into one and is then worth \$50 a ton. The intention of the company is to substitute electricity for compressed air.

#### GUNNISON COUNTY.

S. T. Grant, president of the Cortland M. Co., Gold Brick district, says the mine has been making regular monthly shipments of about three carloads of high-grade ore, and will soon be able to ship about 100 tons. The ore shows ruby silver and black sulphurets running high in silver and wire silver and leaf silver in fracture planes. Mr. Grant says the Chloride mine, in the same district, is a shipper from the grass roots, several cars of rich ore having been shipped from the first 15 feet from the surface.

The Inez mine at Gunnison, owned by the Inez G. & S. M. Co., has been leased by J. C. Nyce and J. Peterson of Aspen. The workings are a 1100-foot tunnel and 260 feet of drift.

### LAKE COUNTY.

It is stated that a rich strike has been made in the New Monarch at Leadville. A trainload of ore is said to have returned from thirty ounces upward in gold, 4% or 5% of copper, and 30% iron excess. The company has commenced paying dividends at the rate of \$50,000 monthly, with only fourteen men employed.

Manager T. L. Davis of the Kubera M. Co. is working its leases on the Continental and G. M. Favorite claims. A contact 7 feet thick between the parting quartzite and white limestone was cut at 50 feet from the surface and the work is being done to develop it.

The Canterbury at Leadville is developing a solid body of manganiferous iron ore struck in the shaft. Assays from the top gave 33.1% iron, 19.2% manganese, and 8.5% silica, with a small amount of silver and lead.

Drifting has been resumed on the Rialto shaft, Leadville. Manager A. M. Gains says the condition at the mine is very encouraging since the water has been lowered.

#### SUMMIT COUNTY.

The hydraulic works of the Mecca Gold Placer Co. will be started again next month under L. Kingsbury's management. Last season's work was successful. Its record shows 28,000 yards of dirt handled, costing 7 cents per yard, and 24,000 yards, costing 24 cents.

Breckenridge, April 23.

The Sarsfield mine, Montezuma district, has been sold to a Denver company, which proposes to commence work about May 15.—The Mosco mine, contiguous to the Silver King, started May 1 with a large force of men.

#### TELLER COUNTY.

It has been reported that the Portland at Cripple Creek is about to be bought by Warner Beit and that \$4,500,000, 25% of the full purchase price, had been deposited in Denver.

The Vindicator Co., at Cripple Creek, report for the first quarter of the year shows 4325 tons of ore marketed, assay value \$186,927.38. Freight and treatment amounted to \$40,550.33, leaving gross proceeds \$146,376.75. Operating expenses and payments to lessees amounted to \$89,990.83, leaving as the net profit for quarter \$56,439.92.

The ore shoot in 350-foot level of the Eclipse Con. Co., Cripple Creek, is 3 feet wide. Samples taken across the vein average \$45 per ton. There is a narrow streak of high-grade ore. The company is upraising and when its extent of shoot is developed stoping will commence. The shoot is said not to have been opened in upper levels, so that from discovery there are 350 feet of ground above, and 70 feet below to the present lowest workings.

Cripple Creek mines during April paid \$571,000 dividends.

The Gold Basin M. Co. has elected officers: E. J. McCarthy, president; R. S. Casey, secretary; J. F. Walsh, manager. The company has a lease on the Big Four. A new shaft is started and is expected to reach ore in 300 feet.

The Rigi at Victor has been leased by A. C. Dake of Denver for five years. Several thousand dollars is being expended in plant on the mine which has been closed down for a year.

The Star G. M. Co., leasing the Home Fraction, at Victor, is sinking the shaft to a depth of 300 feet. The 200-foot level has been run 85 feet on a 4-foot vein. J. F. Erisman is Supt.

The Chicago M. & L. Co. have incorporated to operate by leasing in Cripple Creek district. The capital is \$500,000. The directors are M. Wolforth, A. Junge, J. H. White, W. W. Wernott and L. A. Reynolds.

The Copper Signal G. M. Co. at Cripple Creek has increased its capital stock from \$1,250,000 to \$1,500,000.

It is reported that two veins opened in the drift run from the 1000-foot level of the Portland at 500 feet from the shaft joined, and assays taken run from \$45 to \$110 per ton, the average being something like five ounces. The vein is 5 feet wide and is said to be all ore.

The Eclipse Con. Co., at Cripple Creek, has struck a 4-inch streak of ore in an upraise from the 250-foot level, showing sylvanite in large masses. Besides this streak is a 4-foot body of ore that averages between \$30 and \$40 to the ton.

Allen & Co., leasing the main block of the Pharmacist, have cut a shoot which they believe was hitherto unknown. At a depth of 170 feet they drifted 10 feet east of the shaft and cut a vein trending about north and south. On this they had drifted but a few feet when an ore body was exposed that measures 4 feet and runs \$60 a ton throughout without screening or sorting.

### IDAHO.

#### ELMORE COUNTY.

H. T. Wright has bonded the Last

Chance mine and hoist and the Brick Pomeroy claim adjoining, near Atlanta, at \$15,000—\$500 cash and the balance before Nov. 1, 1901.

#### KOOTENAI COUNTY.

Many claims have been taken up in the new St. Maries placer field east of Tekoa; but the prospecting has not developed any paying claims beside the discovery.

#### LATAH COUNTY.

The cyanide plant and stamp mill to be built by the Jericho M. Co. near Elk City is to be of twenty-five tons capacity, and it is expected that the mill will be running by July 1. Besides two shafts, several tunnels have been run and a great deal of stopping ground opened up. A hoist and pumps will not be bought until the mill is running; C. Schill, Kendrick, is manager.

#### NEZ PERCES COUNTY.

R. N. Graves, director of the Alamance Co., mining at Elk City, is superintending the reconstruction of the mill which was burned in March. The new mill will have a capacity of twenty-five tons daily and is expected to be working by July 1st.

#### SHOSHONE COUNTY.

The Frisco mine is closed down indefinitely, owing, it is said, to the unsatisfactory lead market and the desire of the owners to make needed repairs on the flume and shaft. The Frisco employs about 300 men.

The Chloride Queen M. & M. Co. at Wallace has begun a tunnel to cut 400 feet below the old workings.

#### WASHINGTON COUNTY.

A smelting plant at Weiser is said to be assured, awaiting the selection of a proper site on which to erect a large plant. The purpose is to build immediately a plant of 100 tons capacity, ultimately to enlarge to 1000 tons capacity per day. A. Eoff of Boise and others are interested.

It is reported that crosscutting and drifting is being done on the third level of Finch & Campbell's Ajax mine, at Dixie, for the purpose of determining whether the ore body is continuous, and if it is, that a 40-stamp mill will be put on the property at once.

#### MONTANA.

##### CASCADE COUNTY.

In the Sweet Grass hills an iron deposit is being developed. The ore body is from 50 to 80 feet wide, carries some percentage of copper and being a fluxing ore will be in demand by smelters.

The Blaine's Peak G. M. & M. Co. has incorporated to mine in Oregon, Montana and elsewhere. Capital is \$2880 and Great Falls the principal office.

##### LEWIS AND CLARKE COUNTY.

The Bimetallic at Washington Bar, F. Herdt manager, propose to build a mill near the mine this summer.

The Viola Jane group, near Helena, has been bonded by C. H. Rosman of Broadwater county at \$20,000. The property is developed by an incline shaft 110 feet deep. A force of men is working developing the property.

##### MADISON COUNTY.

The Big Show G., S., C. & I. M. Co. has been incorporated in Wheeling, W. Va., capital \$1,500,000, to work the Big Show, Iron Mask and Quartz Wonder mines. The incorporators are C. E. Lentz of Twin Bridges, Mont., H. F. Smith, J. B. Wolfe, E. Wagner, R. M. Shearer, J. J. Cushing.

Field & Morris have shipped a car of \$200 ore from Clipper tunnels 4 and 5 at Pony.—L. Tarbot has sold his half interest in the Bessie O'Brien lode to F. Meyers and R. T. Smith for \$2500.—The Red Bluff mine, at Red Bluff, will start up again in about six weeks.

##### MEAGHER COUNTY.

The Bob Evans C. M. Co. has incorporated in West Virginia, with principal office at Toledo, Ohio, to mine in Meagher county, Montana.

##### PARK COUNTY.

C. Werngreen and associates have bonded the Bear Gulch M. Co.'s property for nearly \$2,000,000. The foreign syndicate expect to close the deal and to proceed to equip the property with a large modern treatment plant.

##### SILVER BOW COUNTY.

It is reported that the Butte Miners' Union has invested \$50,000 in Amalgamated C. Co. stock. The investment gives every miner in Butte district a personal interest in the mines. It is stated that 8% has been guaranteed on the investment and the full price of the stock in case it wishes to sell after one year.

Two-thirds of the stock of the Boston & Montana and Butte & Boston Cos. is reported to have assented to the consolidation with the Amalgamated Copper Co. Steps have been taken to prevent the consolidation and a temporary injunction has been granted in New Jersey, restraining

the Amalgamated C. Co. from purchasing control until the full terms upon which the deal will be made are fully disclosed to the stockholders.

T. T. Hoffman has made a strike in the West Olive Branch, near Butte. The assays are said to show \$64.80 in silver and 4% copper to the ton.

#### NEVADA.

##### ELKO COUNTY.

Developments made in the lignite deposits near Elko consist of a shaft 60 feet deep with a 100-foot incline at a pitch of 20° on the vein, showing 40 inches solid coal and a 50-foot drift, which shows 33 inches of good quality coal. A partial analysis is said to show 46% fixed carbon, 47.1% volatile, 3.5% ash.

##### ESMERALDA COUNTY.

The Mascot gold mine, in Hawthorne district, has been sold by Summerfield & Bauer to the Hawthorne G. M. Co. of Boston, Mass., who will soon begin development on the claims. S. M. Summerfield of Hawthorne, Nevada, is manager.

##### HUMBOLDT COUNTY.

A San Francisco syndicate has engaged Prof. E. E. Smith of Stanford University, Cal., to make an examination of the niter beds in the vicinity of Lovelocks.

##### LINCOLN COUNTY.

The State Line Metal Co. has incorporated in Iowa, capital \$50,000, to mine in Yellow Pine district, near Pioche.

M. W. Conkling of Los Angeles, Cal., has bonded the Potosi mine at Pioche and has let a contract to J. Metcalf and J. La Cyr to run 100 feet of tunnel.—In the Green Monster mine silver ore has been struck in the 180-foot level, carrying over seventy ounces silver and 10% copper.

##### STOREY COUNTY.

It is reported that Charles Butters has bought the dumps of the Union Con. M. Co. at Virginia City and will erect a mill there to treat them.

##### WHITE PINE COUNTY.

D. C. McDonald, W. Ryneason and C. S. Lamphear, owners of the Valhalla mine, near Robust, are taking from a shaft 27 feet deep ore that goes 60% lead, 34 ounces in silver and \$1.50 in gold.

##### WASHOE COUNTY.

The Great Western Co. is sinking its shaft at Steamboat Springs 2 feet a day and expect to cut the vein shortly.

#### NEW MEXICO.

##### GRANT COUNTY.

The Pinos Altos G. M. Co. is drifting on the 900-foot level. Over 100 tons of ore are taken out daily and treated at the company's mill, the concentrates going to a smelter. The present capacity of the mill is to be doubled and the water supply increased in the near future.

##### OREGON.

##### BAKER COUNTY.

The townsite of Sumpter is believed to be on the channel of an old bearing stream. Miners sinking to bedrock have found good pay and are preparing under contract with the owners of the townsite to work extensively by drifting.—It is reported that E. H. Hackett, managing owner Tom Paine mine, Baker City, will begin work on that property at once.

At the Keystone-Belle mine, Baker City, development continues and the tunnel is now in over 800 feet; J. W. Bolland is manager.—It is reported that at 980 feet in the tunnel of the Little Giant mine, Baker City, the main ledge was cut and found very rich. The Little Giant M. Co. is the owner of this mine.

The Homestake mine, in the Burnt River district, reports a rich strike. It is owned by the Great Western P. & D. Co. of Salt Lake City, Utah. It has a ledge of free-milling, low-grade gold ore.

Ore from the Mammoth mine is treated at the Virtue mill. The former is owned by J. H. Parker, L. Sommer, I. Baer and J. Wilson of Baker City.

The owners of the Pomeroy dredger, operating on Snake river, near Weatherby, are considering the erection of another dredger of larger size, and have recently secured bonds on rich river bottom in Grant county.

##### JOSEPHINE COUNTY.

The Mountain Lion mill, situated in Missouri Flat district, has been started and is crushing ore from the vein recently discovered.

W. P. Gilkeson and J. Lewis of Seattle bought J. W. Thomasson's quartz claims, near Placer. Men have been put to work on the mine, which so far as developed shows a 2-foot vein of good ore.

It is reported that a rich strike has been made in the Roaring Gilet mine, owned by Houck & Mitchell, at Gold Hill. The property is being worked under a bond by parties who, it is said, have already taken out several thousand dollars.

#### UTAH.

##### DAVIS COUNTY.

The Consolidated M. & M. Co. has incorporated, capital \$37,500. Albem Allen is president, N. H. Ives secretary and treasurer, Ogden. The company proposes to develop claims in Weber mining district.

##### GRAND COUNTY.

The Green River Oil Co. has incorporated with capital at \$250,000 to work the Romney and other oil claims. J. H. Moyle is president and F. C. Bassett secretary and treasurer, Salt Lake City.

The National C. M. Co. has incorporated to mine the National and other claims on Onion creek. I. E. Smith is president; C. E. Peyton, secretary and treasurer, Salt Lake City.

##### JUAB COUNTY.

Dr. Franklin and J. DuBois of Salt Lake City are considering the future development of the Mountain View, at Eureka, in which they are interested. Power will probably be furnished by the Yankee when the plant is installed.

##### SALT LAKE COUNTY.

President S. McIntyre of the Mammoth refused to extend the time for the acceptance of the option held by the Bingham C. & G. M. Co. on the mine and it will not be bought by the latter company.

Col. E. A. Wall has taken an option on the Jay Gould 1 and 2 claims at Bingham, making a payment of \$1000 down, balance of \$14,000 by April 23, 1902.

The Bingham Con. M. & S. Co. has been incorporated in Maine, capital \$10,000,000, to absorb the Bingham and adjacent properties. The stockholders of the Bingham C. & G. M. Co. are to receive \$5,000,000 of this in stock in exchange for their stock, and \$2,000,000 of the stock is to pay for the Dalton & Lark and other claims and purchase of the Copper Belt R. R. from the Rio Grande Western track to the mine. The treasury is to be provided with \$1,000,000 cash and \$2,000,000 of stock are to remain in the treasury. The Mammoth and Grand Central are not included.

The Yampa group at Bingham is reported working in a new development made in the main shaft. In sinking, after the stratum of gold-bearing ore, at 90 feet depth the sulphides were entered for 40 feet in solid ore; an average sample is said to have assayed from the bottom 10% copper, sixty ounces silver and \$6 gold per ton.

During six months ended December 31, 1900, the smelter of the Utah Con. treated 40,103 tons sulphide copper ore, which produced 1199.81 tons fine copper, 48,869.52 ounces fine silver and 4341.563 ounces gold.

##### UTAH COUNTY.

The Tintic Con. M. Co. has incorporated, capital \$5000, to mine the Sister May group in Silver Lake district. O. Hudson is president, C. B. Jack treasurer and secretary, Salt Lake City.

##### SOUTH DAKOTA.

##### LAWRENCE COUNTY.

The Clara Bell M. Co. has been incorporated to work the Clara Bell mine. F. Hebert is president, C. Hebert secretary. A new shaft is to be sunk and concentrators are to be added to the stamp mill.

##### PENNINGTON COUNTY.

The Imperial M. Co. expects to begin work on their 100-ton cyanide plant at Deadwood in May.—The Hidden Fortune M. Co. propose to put in a 200-ton plant at Belle Fourche.—The cyanide plant of the Homestake mine, to treat 1200 tons daily, has started operations.

##### WASHINGTON.

##### FERRY COUNTY.

The main Wauconda ledge has been cut, the big vein recently passed through proving to be a blind lead. The average samples of 7 feet showed a value of \$13.20. A picked sample assayed \$49 per ton. The ledge is being cut almost 600 feet below the surface.

##### STEVENS COUNTY.

C. C. Knutson, owner of the Great Republic, near Northport, is reported to have interested capitalists to work the property with machinery. The ore is gold-copper, of a rather refractory nature.

##### WYOMING.

##### UINTA COUNTY.

H. A. Titcomb, Asst. manager of the Carissa mine, at South Pass, says extensive ore bodies have been developed on the lower level of that mine.

The Copper King, near South Pass, is being developed by Harsh & Vosburgh.

#### FOREIGN.

##### BRITISH COLUMBIA.

J. B. Hobson of the Cariboo Con. H. mine at Bullion verifies the statement that the first clean-up this season will be

exhibited at Glasgow. A blast of 175,000 pounds of black powder will be exploded at the mine, breaking down 2,000,000 cubic yards of pay dirt for sluicing.

Work has started on the concentrator at the Enterprise mine, near Nelson, owned by the London & British Columbia Gold Fields. The contract, which includes a compressor plant, has been let to G. McFarlane of Nelson. It is expected that the concentrator will be in operation by September.

The St. Keverne Mines, Ltd., have incorporated to work the Keverne group at Slocan. J. A. Finch of Montreal is president. There will be a considerable sum expended in development.

It is reported from Spokane that a smelter will be built this summer at Midway by J. Breen, to treat ore from the Dominion Copper Co. mines.—At the Nettie L. at Lardeau a new fan and water wheel will be installed in the lower workings. The company is considering the installing of machinery in the mine and a concentrator in Ferguson, with an aerial tramway connecting the two.

On the Green Mountain, Rossland, prospecting with a diamond drill has discovered a ledge over 100 feet wide. The ore runs from \$8 to \$10 per ton and can be concentrated. The company will develop it and erect a concentrator.

The Golden Monarch M. & M. Co. of Spokane, Wash., operating in the Foghorn at Ymir, has cut 200 feet from the mouth of the tunnel, a blind vein showing 12 inches of good ore.—A. W. Boyd, manager of the Canadian King at Erie, states that men have been put to work on this property, and that when the snow goes, the company intends to install a compressor and other machinery.

W. S. Rogers and C. Geit of Spokane, Wash., interested in the Iron Horse at Slocan, have been visiting that property. It is said the bond is to be taken up and hoisting machinery will be installed.—Work has been restarted on the Ottawa, at Slocan, recently bonded by J. M. Williams for English people.

The London Con. and Richelieu Cos., which own the Silver Hill, near Nelson, will contract shortly for the construction of a tramway 10,000 feet from the mine to the wagon roads.

A second smelter is said to be assured at Grand Forks. C. R. Tuttle, manager American M. I. Co. of Minneapolis, and some Duluth capitalists have proposed to build a 1000-ton smelter if a site could be had and contracts from mine owners for ore could be secured. The Board of Trade of Grand Forks has promised the smelter site, and mine owners present guaranteed sufficient ore to start operations.

Work on the Wreck Bay placers on the west coast of Vancouver island, suspended during the winter, has started up and gold is being taken out from black sand at the rate of \$400 a day, with two washing machines.

##### JAPAN.

Gold has been known and mined in a small way in Yezo, the northernmost of the Japan islands, for many years. The general activity elsewhere has stimulated prospecting and new and larger discoveries are being made. The climatic conditions are somewhat similar to those of southeastern Alaska. Rain is excessive and the mining ground is covered with moss and other vegetation. It is at present only a gold field for Japanese.

##### MEXICO.

The Minas Prietas Reduction Syndicate, M. P. Perry manager, Torres, Sonora, working tailings from Grand Central mill at La Colorada, is increasing the plant by adding a slimes wheel, a large dynamo and other machinery. They now separate the copper from their product and sell copper sulphate to mining companies for use in their mills. The plant treated 10,464 tons of tailings in March.

J. L. Green has bonded three mines at Galiban, Sonora, and proposes to begin work upon them at once. They are old mines formerly extensively worked.

##### NEW ZEALAND.

The dividends paid by dredging companies during 1900 were £100,211, from twenty-eight companies, having £202,652 paid up capital—about 50% per annum on capital. Seventeen other dredging companies at work, with £125,000 paid up capital, have not so far paid any dividends. The return on total paid-up capital of these forty-five dredging companies was at the rate of 31% per annum. The total gold yield of dredging for 1900 is 62,275 ounces, value estimated at £239,750.

##### PARAGUAY.

J. H. Wall of Sydney, Australia, has recently prospected the Rio D'Oro at the Matto Grosso gold diggings in the interior of Paraguay. The results of the prospecting are said to be satisfactory and the Transpacific Exploration Syndicate

has been formed in Sydney to work by dredging 32 miles of river bed in a concession obtained by Mr. Wall.

#### RHODESIA.

The Globe & Phoenix G. M. Co. started running their mill on August 5th last. The ore milled in 123 days was 30,544 tons, gold production 24,778 ounces, average extraction \$16.85 per ton, and average value of tailings \$4.73 per ton. The width of the ledges mined is 20 inches and 30 inches.

#### Personal.

J. B. JENSON of Salt Lake City, Utah, is in Mexico.

C. D. HAZZARD of Quincy, Cal., is in San Francisco.

JAMES H. KINKEAD, of Virginia City, is in San Francisco.

R. BUCK, M. E., of Dawson, Yukon Ter., is in San Francisco.

GEORGE W. STARR, Supt. Empire mine, Grass Valley, Cal., is in San Francisco.

A. LAIDLAW has resigned as manager Standard Pyritic Smelter, at Greenwood, B. C.

D. KANE of Salt Lake City, Utah, is in charge of the St. Peters mine, Grants Pass, Or.

HON. J. T. DAVIS, Pres. Sweepstake Hy. mine, Weaverville, Cal., is visiting in San Francisco.

G. KISLINGBURY of San Francisco is in Colorado examining a mining proposition for Capt. DeLamar.

W. G. DOUGLAS, Supt. Gould & Curry mine, Virginia City, Nev., has returned there from San Francisco.

J. T. FINLEN, who has been in Grass Valley, Cal., for Senator Clark's syndicate, has returned to Montana.

SOLOM SPIRO, manager Lucky Bill and Little Bell groups, Park City, Utah, has returned there from New York.

VICTOR BARND, manager Tybo M. & R. Co., at Tybo, Nev., has returned to that place from a visit to New York.

J. B. HOBSON, manager Cariboo Con. Hy. G. M. Co., has gone to Bullion, B. C., to start the mine up for the season's run.

BENJ. OPIE, Supt. Pennsylvania mine, Grass Valley, Cal., has been in San Francisco in connection with the litigation of his company.

JOHN TRUSCOTT, formerly Supt. Onaida mine, Sutter Creek, Cal., has accepted the superintendency of the Bunker Hill mine, near Amador City, Cal.

GEO. ICARD, formerly of Rough and Ready, Nevada Co., Cal., is gold mining in Benguet Province, Philippine islands, with, it is said, very good results.

I. M. KENNELLY, who has been superintending for several months the development of mining properties for the late R. C. Chambers, has returned to Salt Lake City, Utah.

WM. MAGENAT, formerly engineer for the Columbia Lead Co., of Esther, Mo., has recently returned from Mexico and is now superintendent of the Catherine Lead Co., Fredericktown, Mo.

#### Books Received.

The U. S. Geological Survey has issued a diagram and tables showing the production of the several anthracite coal fields in Pennsylvania since 1820, together with a map showing their location. The graphic method employed enables the reader to get a comprehensive grasp of a very great industry with comparatively little mental labor.

"Gold Milling, Principles and Practice," by C. G. Warnford Lock, published by E. & F. N. Spon, Ltd., 125 Strand, London, and Spon & Chamberlain, 12 Courtland St., New York, 823 pages, 8vo. The work is by far the most elaborate dealing with the special subject that has ever been published. Its limitation of discussion to what is gold milling practice today and its development of the commercial side of the subject are features that can not be too highly commended. Higher mathematics in mechanics and chemistry are not forced to the front, but principles which are their conclusions are expressed in simple, intelligible language. Designed, as the author says, to serve the everyday practice of the mill manager and his workmen, the book is valuable to the student of mining and metallurgy. The mass of statistical information reduced to common terms will save him much of the purely physical labor connected with the acquisition of knowledge of the subject. This feature of the work could have been improved for American use by giving costs in dollars and cents, as well as in English money units. The book is a valuable contribution to the text-books of a special literature heretofore scantily supplied. Price \$10.

#### Commercial Paragraphs.

THE Colorado Lamp Co., 2051 California St., Denver, Colo., has recently received a large order from the Government of New Zealand.

JAMES C. H. FERGUSON, Pacific coast sales agent for the Midvale Steel Co. of Philadelphia, has established offices at 123 California St., San Francisco.

THE Denver & Rio Grande R. R. passenger department is getting out a finely illustrated and descriptive book relative to points and sections through which their lines pass.

THE Hoff Asbestos Mfg. Co. of San Francisco and Los Angeles, Cal., report that their asbestos air cell sectional steam pipe covering has been adopted by the S. F. Gas & Electric Co. after a test on the steam plant of the Palace Hotel at San Francisco.

CRANE CO., Chicago, manufacturers of valves, fittings, etc., will erect this summer a modern fireproof building exclusively for its offices. It will be about 90 feet by 100 feet, five stories and basement, and will be located adjacent to its large manufacturing works at Canal and Twelfth streets.

THE Pacific Commercial Museum at San Francisco, Cal., is preparing an exhibit and gathering information to develop and facilitate trade with the Philippine Islands. The museum now has an agent at Manila, to whom instructions have been sent to report on the articles now marketable, their sale prices and such other information as shall give merchants and manufacturers the fullest possible information.

THE Keystone Driller Co. of Beaver Falls, Pa., are making extensive additions to their manufacturing plant. They have bought additional land and will put up three new buildings and additional machinery. They expect to increase their present output of drilling tools and supplies 400% to meet the increasing demand. They announce that they are in the market for timber and roofing slate.

THE U. S. Treasury Department, by O. P. Austin, Chief of the Bureau of Statistics, is advocating a floating exposition to carry samples of our manufactures to foreign countries. German merchants and manufacturers have had successful experience with this aid to advertising and there is no reason why our people should not. The suggestion is worth the consideration of the manufacturers of mining tools and appliances, particularly with reference to supplying the trade in eastern Asia and the islands. This field has been held by German manufacturers.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LOCKS.—No. 672,594. Dated April 23, 1901. P. V. Cornils, Seattle, Wash.

This invention relates to improvements in locks of that class known as "mortise locks." It consists essentially of a knob spindle normally rotatable to operate the latch mechanism; a lock plate at one face of the door stile exterior to the lock; devices carried by the spindle movable into and out of engagement with the locking plate to secure the spindle against rotation when engaged, and means independently operating from each end of the spindle for moving the locking devices out of engagement with the lock plate and releasing the spindle.

PIPE COUPLING.—No. 672,598. Dated April 23, 1901. W. F. Drew, Sacramento, Cal.

The object of this invention is to unite pipes at any angle at which they may meet, and to form tight joints at such angles or any change thereof as may afterwards be made. The pipe sections have the adjacent ends reversely curved so that the meeting ends of the pipes stand axially in line. A globular segment formed upon one of said ends, and a corresponding concavity upon the other into which the convex portion fits, with a clamping nut, operates to secure the parts together and allow them to be adjusted before locking.

DISK HARROWS.—No. 672,485. Dated April 23, 1901. J. Lindstrom, San Jose, Cal., three-quarters assigned to Farmers' Union, same place.

In this invention gangs of disks are mounted on standards depending from pivotally mounted horizontally turnable bars, and draft rods extend upwardly and forwardly from the lower part of the

standard. Levers are pivotally secured between their ends having opposite ends connecting with the draft rods. The slidable crosshead between the gangs and connections between the crossheads and the inner ends of the levers serve to simultaneously turn the gangs with relation to each other.

EXPANSIBLE PACKING ATTACHMENT FOR ARTESIAN WELLS.—No. 672,475. Dated April 23, 1901. F. Cavallaro, San Jose, Cal.

Within the casing of the well and between it and the suction pipe is an annular bag encircling the pipe having a reinforce bottom and expansible sides. Pipes enter the bag and adjustably suspend it at any depth below the surface. These pipes are adapted to transmit a fluid pressure to the bag to distend the sides and form a tight seal between the suction pipe and the casing. When water is being pumped a vacuum is formed below this packing bag and the air pressure thus produced in the surrounding strata causes an increased flow of water into the well.

WELL-DRILLING ATTACHMENT.—No. 672,470. Dated April 23, 1901. E. D. Wolbert, Bakersfield, Cal.

This invention relates to well-boring drills, sand pumps and like apparatus, and its object is to provide a means for slowly raising the drill or other part and then allowing it to drop more suddenly so as to penetrate the material through which it is passing, and when used in conjunction with a sand pump the sudden dropping of the pump causes it to agitate and stir up the material and thus fill the pump bucket. It consists of a fulcrumed lever, a pulley carried at the outer end, over which the drill rope passes, a revoluble cam, a slide movable upon the pulley carrying lever which is engaged by the cam, and means fulcruming the slide adjacent to the lever so that the latter is moved about its fulcrum, and the outer end caused to travel at different rates of speed. In conjunction with this is a latching device whereby the lever and pulley may be retained out of contact with the cam when desired.

#### List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,  
PIONEER PATENT SOLICITORS  
FOR PACIFIC COAST.

FOR WEEK ENDING APRIL 23, 1901.

672,691.—SAW SHARPENER—G. Y. Anderson, Dyea, Alaska.  
672,662.—DESK TELEPHONE—A. K. Andriano, S. F.  
672,816.—HAIR FASTENER—Lottie Bassett, Cedarville, Cal.  
672,438.—TRICYCLE—F. E. Black, Bellemont, Ariz.  
672,869.—BOLT CUTTER—S. S. Bolsinger, Brockway, Or.  
672,475.—ARTESIAN WELL PACKING—F. Cavallaro, San Jose, Cal.  
672,494.—LOCK—P. V. Cornils, Seattle, Wash.  
672,598.—PIPE COUPLING—W. F. Drew, Sacramento, Cal.  
672,524.—AMALGAMATOR—Ghiglieri & Schofield, Stockton, Cal.  
672,485.—DISK HARROW—J. Lindstrom, San Jose, Cal.  
672,737.—WRENCH—Mahana & Pompe, Toledo, Wash.  
672,739.—AMALGAMATOR—L. Mayhew, New Whatcom, Wash.  
672,740.—AMALGAMATOR—L. Mayhew, New Whatcom, Wash.  
672,453.—FRUIT GRADER—S. McGarvin, Fresno, Cal.  
672,801.—LOOMS—J. H. Northrop, Tustin, Cal.

#### Latest Market Reports.

SAN FRANCISCO, May 2, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 50c San Francisco, 48½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.75; carload lots, \$16.62½. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £70 7s 6d per ton.

LEAD.—New York, \$4.42½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco, \$4.90, carload lots, 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 3s 6d per ton=2.73½ cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 28c; 1000 lbs., 28½c; 500 lbs., 28½c; less, 29c; bar tin, \$3, 32½c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.00 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15c.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb., small lots.

BISMUTH.—New York, \$2.25 per lb.; 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, \$1.95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c per lb.

PLATINUM.—San Francisco, crude, \$22 per oz.; New York, \$22 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c per set; 14 oz., 40s., 9½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c per lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½, B. 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sks, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

**THE S. H. SUPPLY CO.,****THE MACHINERY DEPOT OF THE WEST,**

22d and Larimer Streets, DENVER, COLO.

During the past three months we have dismantled three mills: the Royal Gorge Mill, Canon City; the Oneida Reduction Works, Victor, Colo., and the Gold Brick Mill at Gunnison, Colo. The first of these was in actual operation less than thirty days; the second, ninety days, and the third one year. In all of these mills amalgamating machinery was used, and the consequence is that we have a great assortment of this class of machinery. For use it is as good as new in every respect. We are offering this machinery at a saving of from 50% to 75% over the cost of new machinery. We have:

- 14 Standard Amalgamating Pans.
- 7 8-Foot Sifters.
- 4 Cleanup Pans.
- 8 Amalgam Safes.
- 15 Quick Elevators.
- 4 Amalgam Cars.
- 5 Quick Tanks.
- 3 Retorts and Bullion Furnaces.

Two of these mills were dry crushing, containing the following roasting and drying machinery:

- Howell Improved White Roasting Furnace (60x27).
- 3 18-Foot Revolving Ore Dryers.
- 1 Bruckner Roasting Furnace.
- 1 40-Foot Pierce Roasting Furnace.

All of these plants were fully equipped with power, including Corliss engines (18x42); tubular boilers and Heine water tube boilers; feed water heaters, and pumps.

Thousands of feet of rubber and leather belting, shafting, pulleys and hangers are in our warerooms. Write for our prices.

The air compressors we have in stock and can make immediate shipment on, are:

- 12x14 Ingersoll-Sergeant.
- 16x14x10 1/2 Norwalk.
- 12x14 Rand.
- 10x12 Knowles Belt Driven.
- 6x8 Knowles Belt Driven.

Our new catalogue is just issued and we will send you one if you ask for it. It contains a large amount of good information in regard to prices, as all of them are put in plain figures. No discounts. Send for it.

**SPECIFICATIONS (Condensed).**

- 2 NO. 5 McCULLY GYRATING CRUSHERS, with steel wearing parts.
- 26 ORE BIN GATES, 20" x 24", made of 5/8" steel plates, with racks, guides, boxes, pinions, shafts and hand wheels.
- 11 UNION CHALLENGE ORE FEEDERS, 11 right and 11 left.
- 11 10-STAMP BATTERIES. Stamps weighing 1000 lbs. each, arranged to be run in mortars of 5 stamps each, driven by belt and tighteners. Mortars especially arranged and designed for inside amalgamation, and weigh with apron 6500 lbs. each. (5 batteries never used.)
- 66 COPPER PLATES, 4' x 5', weighing 5 lbs. per square foot, plated with one ounce of silver per square foot.
- 6 OVERHEAD CRAWLS, complete with Norway Iron Hooks.
- 420 LINEAL FEET 1/2 x 1 1/2 TRACK.
- 6 1-TON DIFFERENTIAL CHAIN BLOCKS.
- 3 2-TON CHAIN BLOCKS FOR CRUSHERS.
- 47 UNION IMPROVED 4' VANNER CONCENTRATORS, complete in every particular. (29 never used.)
- 2 AMALGAM CLEAN-UP BARRELS, 23 x 36.
- 1 AMALGAM CLEAN-UP BARREL, 20 x 30, complete with tight and loose pulleys.
- 3 4' SWINGING BATTEAS and all fittings complete.
- 1 CAST IRON WASH TANK for clean-up work, 48 x 30 x 16.
- 1 HORIZONTAL 12" GOLD RETORT with all iron work complete.
- 1 SET OF IRON WORK FOR BULLION MELTING FURNACE.
- 2 MAIN DRIVING PULLEYS, 78 x 23 1/2.
- 2 MAIN ROPE WHEEL, 120", grooved for eight 1 1/2" ropes.
- 6 PULLEYS, 36 x 17.
- 1 LOT, being all necessary shafting, hangers, pulleys, belting, etc., for mill.
- 1 LARGE LOT OF PIPING, all sizes.
- 1 RAND DRILL COMPANY'S COMPRESSOR, 16 x 22, Class D, duplex (never used).
- 1 RANKIN & FRITSCH 16 x 22 CORLISS ENGINE.
- 1 HORIZONTAL RETURN TUBULAR BOILER, 75 H. P.
- 1 3-PHASE ALTERNATING CURRENT GENERATOR, 500 K. W., 60 cycle with 24 poles, type A. P., volts full load 2400, A. M. P. 120, revolutions 300, with rheostat.
- 1 ELECTRIC GENERATOR OR EXCITER, 12 1/2 K. W. Multipolar Direct Current Exciter, type M. P., class 4-12.5-12.75, volts 125, with rheostat.
- 1 MARBLE GENERATOR SWITCHBOARD PANEL, 30" x 90" x 2", containing one general field rheostat, one exciter field rheostat, one station transformer, one potential indicator, one current indicator, one pilot lamp, one ground detector with plug and receptacle, 3 type L lighting arresters, 6 feeder fuse blocks, one double pole exciter switch, two single pole switch brake 2000-volt switches, iron angle frame.
- 3 3-PHASE INDUCTION MOTORS, type "I," class 12-150-600, form "A," H. P. 150, cycle 60, volts 2080.
- 2 3-PHASE INDUCTION MOTORS, type "I," class 8-30-900, form "A," H. P. 30, cycle 60, volts 220.
- 1 3-PHASE INDUCTION MOTOR, type "I," class 10-50-720, form "B," H. P. 50, cycle 60, volts 2080.
- 100,000 FEET NO. 2 B. & S. COPPER WIRE.
- 1 LARGE LOT OF ELECTRICAL FIXTURES AND FITTINGS.
- 2 PELTON WATER WHEELS, 350 H. P. each.

222 MARKET STREET,  
SAN FRANCISCO, CAL.

### "THE DANIEL BEST"

50 Horse Power

## TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.
Estimates made for complete Steam Freighting Outfits. Address

TANGENTIAL WATER WHEELS

MANUFACTURED BY

RISDON IRON WORKS,
SAN FRANCISCO, CALIFORNIA. □

We build Water Wheels for any head and for any power. Complete electrical power generator wheels a specialty. Large wheels up to 50 feet diameter for driving compressors.

SEND FOR CATALOGUE NO. 4.

A GOOD ROOF==

P. & B. Ready Roofing is a good roofing—in fact, it's the best roofing manufactured, for it outwears tin, iron, shingles and slate, and is easier to apply at less cost than any of them.

P. & B. Ready Roofing is not a paper roofing, nor does it contain tar—it will not run from the sun, crack from the cold or rot from any reason whatever. It's fireproof, waterproof, not affected by heat, cold, dampness, gases, fumes, smoke. It can be laid by anyone in the shortest possible time on either steep or flat roofs. With each roll is enough cement, galvanized nails and roof paint to properly lay the roofing contained in roll. Free booklet tells how to lay P. & B. Ready Roofing and all about it. Address Department "A."

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

GATES IRON WORKS

The Copper Furnace herewith reproduced is one of two sold to the GRANBY CONSOLIDATED MINING AND SMELTING CO., LTD., BRITISH COLUMBIA. The size is 44x160 inches. These two furnaces were

sold on a guaranteed capacity of 500 tons per day. Before the furnaces had been in operation a month they developed an average capacity of 600 tons per day, and the highest daily record has exceeded 735 tons. The cost of operation has steadily declined under the management of General Manager Hodges, until six-dollar copper ore is paying a handsome profit.

FULL DETAILS OF OUR SMELTING FURNACES GIVEN IN OUR NO. 11 BOOKLET.

All of GATES IRON WORKS machinery is as good as it is represented to be, and often much better. We build every modern type of apparatus for the reduction of the precious ores by every established process. Our three great lines are these:

**Mining
Machinery,
Rock and Ore
Crushing
and
Cement
Machinery.**

WE BUILT THE FIRST STAMP MILL ERECTED IN THE ROCKY MOUNTAINS.

WE PUBLISH FOR THE USE OF INTERESTED PEOPLE, 17 BOOKLETS DESCRIBING OUR MACHINERY.

Main Office and Works, 650 Elston Ave., CHICAGO.

FAIRBANKS-MORSE GASOLINE-DISTILLATE GEARED HOISTER.

An efficient and reliable combination of a Fairbanks-Morse Gasoline-Distillate Engine on the same base with a Friction Hoist. Modern and up to date. We publish a special catalogue describing our Hoister which we gladly mail prospective purchasers.

FAIRBANKS-MORSE GASOLINE-DISTILLATE ENGINES.

ALL SIZES UP TO AND INCLUDING 54 HORSE POWER.
For Pumping, Milling, Lighting, Air Compressors, Etc.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

THE COMPRESSED AIR MACHINERY CO.

11 & 13 FIRST ST., SAN FRANCISCO, CAL.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 28" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/4" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : **S. K. SNODGRASS, Denver, Colo. (The Windsor.)**

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

HAAS, BARUCH & CO.,

100 CALIFORNIA ST., SAN FRANCISCO, CAL.
 SOLE AGENTS.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

VALUABLE BOOKS FOR PROSPECTOR MINERS AND MINERALOGISTS.

Orton.—Underground Treasures: How and Where to Find Them. A Key for the Ready Determination of all the Useful Minerals within the United States. By James Orton, A. M., late Professor of Natural History in Vassar College, N. Y.; etc. Illustrated. \$1.50

Osborn.—The Prospector's Field Book and Guide in the Search for and Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D. Author of "A Practical Manual of Minerals, Mines and Mining." Illustrated by 58 engravings. Fourth edition, revised and enlarged. 316 pages, 12mo. Price. \$1.50

Osborn.—A Practical Manual of Minerals, Mines and Mining: Comprising Suggestions as to Localities and the Associations of all the Useful Minerals. Full descriptions of the Most Effective Methods of Both the Qualitative and Quantitative Analyses of Each of these Minerals and Hints upon the Various Operations of Mining, including Architecture and Construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. Second edition, revised and enlarged. 386 pages. 8vo. Price. \$4.50

IN PREPARATION, ABOUT TO BE PUBLISHED:

Erni & Brown.—Mineralogy Simplified: Easy Methods of Identifying Minerals, including Ores, by Means of the Blow-pipe, by Flame Reactions, by Humid Chemical Analysis, and by Physical Tests. By Henri Erni, A. M., M. D., some time Chief Chemist of the United States Department of Agriculture. Third Edition, revised, re-arranged and with the addition of entirely new matter, including Tables for the Determination of Minerals by Chemical and Pyrognostic Characters, and Tables for the Determination of Minerals by Physical Characters. By Amos P. Brown, E. M., Ph.D., Assistant Professor in charge of the Department of Geology and Mineralogy in the University of Pennsylvania. 350 pages, illustrated by 56 engravings, pocket-book form, full flexible morocco, gilt edges. \$2.50

The above or any of our Books sent by mail, at publication prices, free of postage to any address in the world.

Illustrated circulars of the above Books, showing full Tables of Contents, will be sent free to any one who will furnish his address.

INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
 810 Walnut St., Philadelphia, Pa., U. S. A.

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs **\$4.00** Per Light
EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.
 Write us for particulars.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.: "We have used Leviathan Belting for four years, up to 24-inch by 2-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.
55-57 Market St., Chicago. 130 Pearl St., Boston.
SEND FOR PRICE LISTS AND SAMPLE.

POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.

Silver,	Fluor Spar,	Metallic Ores

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested
by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent Ameri-
can engine builders, who are good judges of lubricators. Many of these
have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use,
or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our
new catalogue, showing our full line, will be sent on application.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of April, 1901, an assessment (No. 22) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALEX. GRANGER, Secretary.

Office—Room 223 Crocker Building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of April, 1901, an assessment (No. 30) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine street, room 31, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of April, 1901, an assessment (No. 14) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 25th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of April, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Mining in the Yukon Country Then and Now.

March, 1901, is not many months away from August, 1898, as time goes, even in the Yukon country; but the advance in mining, though this difference of time, can well seem a marvel to those who knew the land first in the older time. Each of the two illustrations on this page is typical of the Yukon mining of the date of the original photograph, and in contrast present a fair idea of the nature of the change that the interval of time has made.

The two men at the windlass were of the thousands who fought their way on foot into the country late in 1897 and early in 1898. Provided with few and poor tools, and no engines or machinery, they won gold from deep-lying frozen ground with fire and by hand work with bucket and windlass. They lived largely in tents and largely without even the commoner conveniences of the civilization they had left. The photograph was taken in one of the stampede camps in August, 1898.

The other illustration is from a photograph taken in March, 1901. The men who are grouped about the mine shaft came into the land in a palace car, a few hours of care-free, luxurious railroad travel, in place of the weary days and weeks on foot, fighting with every step frost and famine. They—and, indeed, all the miners there now—have the best mining tools, engines and machinery adapted to the special physical conditions under which mining is carried on there. Three years in the Yukon and there is no longer any difference between mining there and in the mountains of Colorado or Montana.

MINING SUMMARY.—224-225-226.
LATEST MARKET REPORTS.—226.
MISCELLANEOUS.—Concentrates, 219. Power Required by Stamps; A Gasoline Hoisting Plant, 220. An Atlin Hydraulic Mine; The Dorcas Pneumatic Cyanide Mill; Electricity a Factor of Importance, 221. A Mine History from Correspondence, 222. Mining and Metallurgical Patents; 223. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Books Received; Commercial Paragraphs, 225.

The business men of Fergus county, Mont., have associated to advertise the mining resources of that county with a view to attracting investors. The idea is excellent, and, judging by the results of similar action by the town of Georgetown, in Colorado, it should well repay its promoters the effort and the money. In these hurry days, with mines offering from everywhere, if any district would receive attention from investors it must make itself known by advertising.

The profit-earning possibilities of deep mining under existing economical conditions has received another demonstration, this time on the Comstock. For a number of years the lode had been abandoned below the level of the Sutro tunnel, about 1700 feet. Lately the old levels below this point have been unwatered and mining resumed as far down as the 2150-foot level. The Con. California & Virginia, taking ore from this reopened ground, have announced a dividend, the first paid for six years.

Fifty years ago the student or learner in mining or metallurgy was obliged to initiate his own studies, the engineer had only one way to get knowledge and that through the shop. Now all such learners have choice of opportunities for learning. The chief advantage of such chance for scientific training is the economy of time. The old way is hard and wasteful. Yet the tendency of the times is to overestimate the value of theoretical knowledge and to undervalue the need of practical training. There never has been any royal road to learning and there never will be. It is made much easier to learn than it used to be, but the homely requirements of diligence, practical work and steady effort are as requisite to success as they ever were. The technical school and the scientific training, now so general and easily procured, are grand adjuncts, but they are only adjuncts, and to the learner nothing will take the place of actual practice. The schools are best aiding the student when they confine their teaching more to principles than subjects.

CABLEGRAMS say that China is suggesting to the Powers the complete opening of Manchuria to exploitation industrially by all countries. If true, the action contemplated is of considerable importance commercially, as well as politically. Manchuria is very rich in minerals. Gold—placers and lodes—silver, copper, lead, iron and coal all exist in minable deposits of great extent and excellent profit-earning possibilities. The placers are, if anything, richer than the Siberian, and have the advantage to the

outside investor that they have not been worked out. The lode deposits are untouched as yet, and the very little coal mining done has done nothing more than prove the quality and probable extent of the deposits. The climate is favorable to mining operations throughout all the year. Timber of good quality is in excellent supply. The means of communication and transport are already better than in Siberia and are capable of rapid improvement. The resident population, estimated conservatively at 10,000,000, are physically strong, industrious and teachable. They will make good miners and workmen under instruction. In this respect they are an improvement on the Russian workmen in the Siberian provinces adjacent. It is to be hoped, if the country is to be thrown open for exploitation, that in the conventions arranged for foreign industrial undertakings the procedure of initiation will be shortened in the consumption of time, the value of which is with difficulty recognized by the Oriental mind.

THE postmaster of Nome City is vexatiously interfering with the sending out of letters from Nome by private carriers, who come out over the ice by the Dawson route. He is reported to have announced that any one carrying letters will be arrested, imprisoned and have the letters confiscated, and that in issuing this order he was strictly within the Constitution. The words of the postmaster are as absurd as his threatened action is petty mischievous. The Constitution has not been decided to extend to Alaska; in fact, Congress has legislated as if it did not. The Constitution does not forbid carriage of letters by private individuals. Statutes which have not been expressly extended in operation to Alaska have permitted the carrying of letters by private corporations, provided the Government charge was paid. Wells, Fargo & Co. for many years throughout the West carried and delivered letters, paying the Government postage out of its own charge. It continues at this time to carry newspaper mail without paying such charge. Aside from the illegality of the action contemplated, the conditions surrounding the mining industry of Alaska are such as to make it a violation of common business sense.

TWO DECISIONS of interest to petroleum and natural gas miners have appeared in late published court reports. The Supreme Court of Pennsylvania decided in January, 1900, that the owner of an oil well had a right to use a gas pump to increase the production of his well, even though it should reduce the production of wells on adjoining properties. The Supreme Court of Indiana rendered a decision in June of last year declaring that the owner of a natural gas well had no right to use a gas pump to increase the flow of his gas well and thereby reduce the natural flow of gas into wells of adjoining land owners. Though one decision relates to oil and the other to gas, both decisions are on the same principle and are opposed to each other as precedents. Being decisions of State courts neither is final, as the same question can be brought before the United States courts in the new discoveries in the West on public lands. Meanwhile the petroleum miner in these new fields will choose which of the two is the more profitable to him and use a gas pump or not, accordingly. Ultimately it would seem as if the later decision must prevail. The court, in speaking of the ownership of several parties in surface lands over the same reservoir of gas, says: "The surface proprietors have the right to reduce to possession the gas found beneath. They could not be absolutely deprived of this right without taking private property. But there is a coequal right in all such owners to take the gas from the common source of supply. * * * There is something in the nature of unity in their possession of the gas in the reservoir. * * * The final conclusion of the court is that one common owner of the gas in the common reservoir cannot divest all the others of their rights without wrongdoing. * * * Independently, however, of any statute, * * * the common owners of the gas in the common reservoir, separately or together, have the right to enjoin any and all acts of another owner which will materially injure, or which will involve the destruction of, the property in the common fund, or the supply of gas." This language may indicate the way the courts will look at the practice of boring oil

wells as close to the lands of an adjoining owner as is practicable in order to drain away all possible of his oil before he sinks his own wells.

The Law of Extralateral Rights.

The litigation over extralateral rights to ore-bearing deposits is seemingly endless. At the time the statute giving them became law miners had recognized only one kind of lode deposits, the typical gold-bearing quartz ledge of California, and knowledge concerning that was rather indefinite. That quartz ledges had dips, spurs and angles was recognized, and that the dip would carry many ledges followed downward, outside of the surface limitations of a claim the extent of which then seemed reasonable, led the mining district organization into the declaration of extralateral rights as subject to appropriation with the outcrop or apex of a lode. The statute law followed the well meant declaration of the old miners.

The mischief of the doctrine was not foreseen then. There was little deep mining of the ledges and the fact that many different parallel apex lines could and would gather with depth into one was given little importance. The flat lying contact deposits of metal-bearing rock were not known nor were lodes which were zones of local enrichment in eruptive rocks without defined walls. All of these lode phenomena are known now, and the mischief of the error has been demonstrated by the endless litigation that arises from honest differences as to questions of fact, and of differences as to what are facts. Not only does the question of fact arise as to where the apex of a disputed lode is, but as well the question what is the apex. The latter question particularly becomes pertinent in some copper-bearing deposits the origin of which is in zones of local enrichment in eruptive rocks, where there are no walls and no structural formation differences, only differences of mineralization. Characteristic of these is the condition that they are not as mined near the surface the original deposit in place, but in a secondary situs of moved surface values. By natural chemical and physical changes the values have concentrated downward and it may be more or less laterally. The surface has become more or less altered and obliterated. The intricate natural phenomena that have resulted only become visible when the act that invites the litigation is completed. They cannot then be said to be understandable.

The Butte, Montana, litigation over copper-bearing deposits, the litigation now on between two mining companies of Grass Valley in California, are the fruits of a policy on its face fair, and of a declaration of law more than ordinarily intelligible and capable of uniformly the same meaning. The inherent vice of it resides in the condition that the facts the law was intended to construe are not construable by it. It is part of the inevitable friction between an untenable theory and unalterable facts. The facts cannot give way, so the obvious alternative ought to be to eliminate the friction of costly litigation.

It is not possible to take away grants of vested rights that already exist in extralateral rights. Indefinitely into the future they must chance it as to litigation. But there is no reason why, knowing an error that can be corrected, that the error should not be corrected. The law of location can be changed so that a reasonable surface area is granted without extralateral rights. No hardship is involved to prospectors in this limitation. Mining exists and is profitable in every other mining country under this limitation and it has been exceedingly profitable under these conditions in the one district, in the United States—Leadville, Colo.—where its acceptance was enforced by reason of the unalterable facts making an absurdity of the untenable theory.

The subject is not included specifically among the subjects to be considered at the next mining congress at Boise, but it is an exceedingly pertinent one and simple enough to receive final action. The weak point in meetings of the congress has been the indirection and lack of finality to its actions. The straight proposition of the change in the statute here suggested made specific and without the appendage of other changes in the mining statutes, however desirable, cannot be dodged by an assertion of vagueness and indefiniteness as to what is wanted.

Concentrates.

FISSURE VEINS can occur in all rock formations; they are found in limestone.

IDAHO has the ninth place in the gold-producing States, the fourth in the silver and the first in lead.

FIFTY-TWO out of fifty-eight counties in California have a commercial production of one or more of forty-six mineral substances.

SO FAR three cities are announced as candidates for selection for holding the next session of the International Mining Congress—Los Angeles, Cal., Knoxville, Tenn., and Cleveland, O.

IT is estimated that the Sudbury nickel deposits contain enough of that metal to supply the consumption of the next century at the present rate of use. At the present time they supply 40% of the total requirement.

THE consumption of quicksilver may soon be increased by its use in incandescent electric lighting. A recent discovery employs incandescent mercurial vapor in a glass tube as an illuminant. The light is powerful and steady, but disagreeable in color. It is expected to remedy this.

IT seems from the result of a recent trial in Montana that Congress in 1875 passed an Act granting railroads right of way over mining claims that are not patented, the miner only having a possessory right. There is no recourse for damages when mining improvements are affected by the operation of the law.

AMONG wants of the mining industry at the present time is a process or manipulation by which petroleum can be applied to produce iron and steel direct from the ores, cheaper than is possible by the use of coke. Petroleum is already being successfully and economically used in ore roasting, in pyritic smelting and in remelting pig iron for casting.

MANUFACTURERS of electrical motors are now willing to guarantee much higher efficiencies in these machines than only a few years ago. Then 80%, or at the most 85%, was all that could be obtained. Contracts are now made guaranteeing as much as 91% for large motors and 87% for small motors. These percentage guarantees are contracted for with three-fourths and half loads.

A SLIP is a plane, either a bedding plane or more often a plane of fracture across the bedding planes, on which there has been a movement of one rock mass relative to the other; or it is applied to describe the rock mass that has moved relative to the other. Its use is limited to describe a localized phenomenon rather than one extending over considerable area. The latter would be described as a fault plane.

In operation as prime movers for electric generators, the piston-driven steam engine has less steadiness of motion, but in regulation responds quicker to the governor than a water wheel. This last is almost absolutely steady in its motion, but as good regulation as with a steam engine is not had. The one machine combining the close regulation of the steam engine with the steadiness of the water wheel is the steam turbine.

ARSENIC is widely distributed in minerals, but rarely occurs in mass sufficient to make an ore that it will pay to mine. The consumption in the arts is so relatively inconsiderable that by-product production of it in connection with the treatment of other ores in which it appears as an associated mineral has supplied the larger part of it. There is at the present time no manufacture of it in the U. S., probably because the ores have not been provided. Arsenolite, the white oxide of arsenic, commonly known as white arsenic, is a common form in which arsenic is marketed. It is worth in New York about 4 cents a pound. In the manufacture of lead shot about 2% of arsenic is employed with the lead.

THE State of Colorado has in force a mining statute of her own which is in line with common sense as regards the location of mining claims. It provides that before filing a location for a claim the discoverer shall locate his claim by sinking a shaft on the lode to the depth of at least 10 feet from the lowest part of the rim of such shaft on the surface, and the shaft so dug must expose the vein on which the location is based, and it is not sufficient that a discovery is made of some other vein within the limits of the claim. The Supreme Court of Colorado has just sustained this law by holding that a discovery made subsequent to the location could not relate back to the date of that location so as to cut out intervening rights.

A BEDDING PLANE is a descriptive term employed in geology to describe the seams in rock formations that perpetuate the horizontal lying planes of contact of the successive layers of rock forming strata as they were laid down or bedded in the marginal sea waters. The expression is synonymous with stratification plane, though custom limits the latter more particularly to describing the contact planes between rock formations that are different, as, for example, a sandstone and a shale. The term "bedding plane" would be applied to the contact planes of layers in the sandstone or in the shale. Joint planes are the planes of the cross seams connecting the bedding planes. A good development of bedding planes and joint planes makes a rock "blocky."

THERE is hardly a construction problem of mine opening, mining machinery or methods which does not admit of more than one answer. As all the answers either directly or indirectly mean dollars and cents, the import-

ance of obtaining the answer which means the least outlay or the largest income is apparent. The difference between the old failure of many mines to be profit earning and the present success of the same mines is largely due to a late recognition of what is here stated. Through many years of the early history of Western mining the practice was made subordinate to an attempt to fit theories to facts the existence of which was sometimes wholly ignored. The rational practice of to-day is to ascertain the facts and deal with them as if there was no theory.

THERE is such a thing as building an engineering structure too well—which means, of course, too expensively. The object of such construction is useful service of a particular kind and it is the duty of the engineer to provide the service at the lowest cost. The dollars that it costs are the measuring rule for testing the structure. There is no necessity of providing refinements in finish or materials that do not correspondingly increase the value of the service. If the service is rendered economically and satisfactorily without certain additions to construction, those additions should not be made. If the useful service demands refinements in material and construction, they are properly part of it. As a rule, the engineering structures required in mining and metallurgy do not require costly refinements of workmanship. They very generally do rough work and are expected to have a limited period of life. The engineer is called on only to plan for the exact amount and kind of work, and for no more.

THERE are two general types of direct acting hydraulic air compressors, the one which works by entraining air and compressing it by the static head of water, and the other operating on the hydraulic ram principle and effecting compression by impact, using the hydraulic head of the moving water. Both are specially adaptable to low water heads and large volumes. Both require very little manual attendance. The efficiency, the ratio of useful work to applied weight of water multiplied by its head, varies with the different machines of each type. With the best of both the efficiency is over 70%; exceptionally it may reach 80%. The hydraulic ram type of machine is to the unit of production less costly of installation and more portable than the other type. The money cost of installation per unit of useful production for either type of these hydraulic compressors is more than for the water wheel and piston compressor. The economy of their use as compared with the latter is a matter of calculation for each special installation. It is for the direct hydraulic types the sum of the larger interest and replacement cost and the lesser operating cost, in comparison with the lesser fixed costs plus the larger operative costs.

TABLES of the flow of water through pipes of different diameters and under different heads are given in Trautwine. The machinery establishments also publish such tables. Every problem that arises is, however, special, and the tables do not give the data of delivery for the different lengths, but for a standard length of 100 feet ordinarily. To use such tables where the question is to know the diameter of pipe necessary to bring a certain quantity of water in a given time where the distance and total fall from inlet to delivery are known, proceed as follows: Divide the total fall less 1 foot by the number of hundreds of feet in the distance to get the fall for 100 feet. Divide the quantity of water by the number of minutes in the given time to get the required delivery per minute. If this quantity is in gallons reduce it to cubic feet. These two quantities, fall per 100 feet which is tabulated as friction head per 100 feet and cubic feet of discharge per minute, are tabulated in couples for different diameters of pipes. Inspection will ordinarily find the couple in the table so that the diameter of pipe required can be read directly. The refinements of an engineer's determination are omitted. It is safer in practice to take a fraction larger diameter pipe than the exact figure calls for. If there are a number of bends allowance has to be made for them by reducing the figure of the total head taken to determine the average fall.

AN efficient, satisfactory powder thawer can be made by a local tinsmith in any mining camp whenever it happens that the storekeepers do not have any in stock. Make of heavy sheet tin a pail of depth exceeding by about 1 inch the length of the powder cartridges and of a diameter that will just hold the number of sticks required for a round of holes. This pail should have a strong wire rim outside of the barrel and should be provided with a ball and a cover. Make a second pail of 2 to 3 inches greater depth and 3 to 5 inches larger diameter. The bottom should be metal heavy enough to stand fire, copper preferably. The barrel and top, which should be soldered solidly together, should be made preferably of heavy galvanized sheet so as to stand the rough handling such tools always receive around a mine. This pail should also be provided with a ball. The top should have cut in it a circular hole, of slightly larger diameter than the barrel of the smaller pail, the edges of which would engage and sustain the wire rim of the smaller pail. The top should be provided with one or more vent holes for steam and about three spring clips disposed to slide on the cover of the smaller pail and hold it down against its buoyancy in the water. To use put in the larger pail a sufficient amount of water. Heat to boiling or a sufficient temperature. Remove from the fire and set into it the smaller pail containing the frozen powder. Cover the pail with old sacks and let the powder thaw by drawing heat from the water. It will be found to thaw evenly and without danger of

spontaneous explosion. After removal of the thawed powder the small pail should be washed with hot water to remove all traces of nitroglycerine. It will be noted that the construction suggested absolutely keeps water and steam away from contact with the powder and that the manner of using effects the thawing at a low temperature. Under no circumstances should dynamite be thawed by putting it in the water nor at a high heat. In storing powder so arrange it that it is either kept constantly frozen or constantly thawed, avoid alternations of conditions, as they impair the quality and make its handling more dangerous.

THE choice of iron or steel for the making of riveted sheet-metal water pipe is a question of comparative cost. By that is not meant simply first cost when it is put in place, but the annual cost or charge which is the quotient obtained by dividing the sum of the first cost in place and the cost of maintenance during all the years of life of the pipe by the number of years of probable life before it will require replacement. It is assumed that the water pipe is a permanent betterment, though in the case of some isolated placers, into which the pipe-making material must be packed at a heavy cost, the life of the mine is the life of the pipe for the estimation, and the pipe metal the use of which would make the first cost least would be the choice. Of the two metals in first cost per pound of the commercial grades employed in pipe making, steel is ordinarily the lowest in price. The tensile strength of the two metals in these commercial grades is for iron 48,000 pounds per square inch and for steel 75,000 pounds per square inch. The strength of the double riveted seam is .70 of the metal. Then for equal resistances to strain in the manufactured pipe iron having net 33,600 pounds of tensile strength and steel 52,500 pounds, the respective thicknesses of metal required would be in the ratio of 1.56 for iron to 1 for steel. There are grades of both iron and steel of higher tensile strength, but for water-pipe building the commercial grades answer every engineering requirement and are more economical. The meaning of the ratio is that it takes approximately 1.56 times as much iron as steel to construct a given pipe. There is, however, a minimum thickness of sheet metal which can be used for a pipe, this minimum thickness being in correspondence with the diameter and independent of the strain. Within the limit of safety of allowable strain, where minimum thickness is required for structure, iron or steel could be used without affecting first cost very much. There is also a maximum of thickness of sheet metal limited by the mechanical difficulties of bending and riveting. There is a great range in the carbon percentages of the commercial steel employed for riveted pipe. These slight differences in composition would seem to result in considerable differences in the metal when applied to this particular use. The behavior of the metal under service has varied so widely and inexplicably that it would seem the difference of conditions must reside in the composition of the metal. Very common or inferior iron does not exhibit any unexpected variations of behavior in service, while steel does. With the latter experience is relatively limited in time, though construction at this time is almost exclusively with it. It is difficult to lay down an absolute rule for practice, owing to lack of knowledge of the effect of the slight differences in sheet steel composition. Some generalizations will, however, be of use in guiding decision in minor problems. For hydraulic mining, where pipes have to be frequently handled, taken apart and put together, iron is preferable; it stands rough handling and lack of care better and is easier manipulated by unskilled labor. Where the pipe has to be made in the field remote from shops, and where the amount of work to be done does not justify the special employment of skilled workmen, iron is preferable. For pipe construction where the safe strain is within the minimum allowable structural thickness of metal, iron should be preferably used. For pipe where the safe strains would require of iron thicknesses of say .45 inch or more steel should invariably be employed. For pipe where the safe strains would require thicknesses of metal more than the minimum allowable, and less than .45 inch for iron, steel is almost invariably the more economical and therefore preferable. The protecting coating given the metal is a large factor in determining the life. Both the material and method of application of the protecting coating have been much improved of recent years. With the improvements it seems probable that the life of iron and steel in pipe would not materially differ. With the inferior protection that has been given, some iron sheet-metal pipe is known to be after thirty years service not appreciably impaired. Steel sheet pipe has not been used except during the last seventeen years. With inferior coating some steel pipes after twelve years service are known to be practically unimpaired. If steel pipe under improved coating can be assumed to have the same life as iron, it is just about one-half as costly as the latter. If steel pipe can be assumed to have 40% of the life of iron pipe, it can cost no more, and will very probably cost less as a consequence of the lowering of cost of production of the metal by the time the replacing pipe is required. With steel pipe assumed to have anything between 40% of and equal life with iron pipe, steel pipe is the cheaper and therefore preferable. The question is one coming up continually now with large power installations and with the additional water supplies that the rapid growth of cities necessitates. There is an opportunity here for the gathering and comparison of the results of service of pipes, particularly their coating and life. The data and deductions would be technically and educationally very valuable.

Power Required by Stamps.

TO THE EDITOR:—A letter by Henry Louis and relating to an article of mine on the "Power Required by Stamps" appeared in a recent issue of the MINING AND SCIENTIFIC PRESS. Mr. Louis has evidently not carefully read the article in question, inasmuch as he has assumed that I meant "indicated" horse power when I wrote "actual horse power." Had Mr. Louis read the article carefully, before criticising it, he would have noticed that I was particularly careful not to employ the term indicated horse power, but invariably used the term actual horse power. It may simplify matters to state just exactly how the power used by a stamp was obtained. It may also be useful to such of your readers who would like to verify the results.

The mill after running normally for some hours, to warm up bearings, etc., was in shape for testing. The engine was indicated and the power shown was 34.65 H. P. The rock breaker was thrown off and the engine indicated; power shown was 29.7 H. P. Therefore the rock breaker consumed 4.95 "actual" H. P. The stamps were thrown off next. Power now shown was 11.85 H. P. The stamps, therefore, consumed 17.85 actual H. P. (= 1.785 H. P. per stamp). The vanners were thrown off; power shown, 9.35. Therefore the power used for vanners was 2.50 actual H. P. The engine belt was thrown off and the final power shown was 4.05 H. P. Therefore the line shafting used 5.30 actual H. P.; the engine used up in its own friction 4.05 H. P. The total of all these powers—34.65—is the indicated horse power to run the mill as a whole.

I hope I have convinced Mr. Louis that I know the difference between "indicated" and "actual" horse power. I suggest, in all courtesy, that Mr. Louis misread my article through not appreciating the fact that "actual" horse power is used throughout the Western States as synonymous with the term brake horse power. Really, the term actual horse power is more correct than brake horse power, inasmuch as this power is almost invariably found, in a mill, by means of the indicator, and not a brake.

The second point made by Mr. Louis is that the friction lost in the guides is "quite independent of the number * * * of the guides!" This argument is deduced from the well-known law of friction that the area of rubbing surface has no influence on the amount of friction developed. This law is so well established that it cannot be disputed. Had Mr. Louis given the matter careful thought, he would have seen that his deduction is quite inaccurate. The guides act as a couple to resist the rotative action of the cam acting out of the center line of the stem. The result is that the stem presses with a pressure of, say, 30 pounds against the lower guide to the right, and with a pressure of 30 pounds against the upper guide to the left. In other words, there are two equal and opposite pressures against the guides. Therefore the pressures against the two guides must be considered separately. The practical result is that there is twice the power lost by friction in the two guides than there is in either upper or lower guide taken by itself. Mr. Louis has overlooked this.

The next point made is that the effect of inertia is exaggerated, inasmuch as I have calculated the effect practically twice over. This is not so. I figure that the total power to operate a stamp is the power required for the actual lift, plus the power lost in friction. Each is considered by itself. Mr. Louis and I both agree that the stamp is lifted considerably higher than the cam lift. It is agreed that the power required to do this must come from the engine. In the formulae and worked examples given in Mr. Louis' book on gold milling no hint is given to this fact. However, the dead lift of the stamp cannot be used in figuring the power, but the actual lift due to the dead lift plus inertia.

Mr. Louis rather ignores the idea that the dynamic pressure of cam against tappet is higher than the dead or static pressure. In other words, that a 850-pound stamp can under certain conditions give an average pressure of 990 pounds against the cam. Surely, if Mr. Louis agrees to the influence of inertia against stopping, he must admit the inertia against starting, and, further, that the action will result in a blow being given by the cam against tappet much in excess of the dead weight of the stamp. From the basis that increased height of lift due to inertia may be taken as a measure of the inertia against starting, I calculated that the dynamic pressure of an 850-pound stamp was, in the case in point, 995 pounds. From a phenomenon in the stamp diagram, to which I believe I first called attention, I found that the cam struck the tappet an initial blow of 1700 pounds, and that the average pressure was, therefore, 990 pounds—a remarkably close agreement. I consider this point proved. Now, the pressure between cam and tappet being greatly in excess of the dead weight of the stamp, it is plain that in calculating the friction lost in various parts of the stamp mill one must use this dynamic pressure, and not the dead weight.

To those who cannot follow this line of reasoning a simple demonstration can be made to prove that inertia against starting will greatly increase the effect of weight. Take a rock of a size that a piece of thin

string can lift it safely when the rock is gently raised. Now, raise the rock sharply and with a jerk, and the string will break. This effect is caused by inertia and the strain on the string may be many times the weight of the rock.

Mr. Louis admits that his formulae do not give accurately the power required to lift a stamp; he prefers, however, to consider the discrepancy as being due to bad workmanship rather than inaccuracy of his formulae. I consider the discrepancy as being due to both causes. One great use of my formulae is to check up the workmanship of the millwright. I would consider that a mill was well built and well designed if the actual power did not exceed 5% more than the calculated power. In the example chosen in my article the figures were obtained from a mill designed and erected by myself with every care to prevent excessive friction losses. If there is any safety in numbers, I may give some results from the justly famous Drumlunnon mill, Montana, which is generally acknowledged to be one of the best mills ever erected on this continent. The stamps were 750 pounds, 8-inch drop, ninety drops per minute, and used 1.869 "actual" H. P. Calculating from my formulae, the power was 1.826; Mr. Louis' formulae gave 1.578 H. P. Mr. Louis' formulae show that 0.291 H. P. was lost per stamp through faulty workmanship, or 17½ H. P. in the entire battery. This, to say the least, would be poor work. My formulae show that .043 H. P. was lost per stamp, due to defective workmanship, or 2.5 H. P. in the entire battery, thus bearing out the reputation of the mill.

Without in any way detracting from any credit due to Mr. Louis, I may say that, while my formulae work out in practice, his do not.

Leadville, Colo., April 29. A. W. WARWICK.

A Gasoline Hoisting Plant.

The Crown Point and Virginia group of mines is situated at the head of Virginia canyon, midway between Central City and Idaho Springs, Colo. The main shaft is down 750 feet, and for years has had the unenviable reputation of having the worst mine water in the State of Colorado. Unfortunately, it is the only supply of water available for the boilers, and the troubles occasioned by its use have been an endless source of worry and expense to the management. On account of the large percentage of sulphuric acid in the water, a boiler would not last more than ten or twelve months, with the most careful handling. During this short period it would often require three complete sets of new flues, not to mention feed nipples, piping and fittings, which were continually requiring attention.

Various methods were tried to treat the water, but nothing proved to be of any practical benefit. Matters reached such a point that the most enthusiastic vendor of boiler compounds would make a wide detour to avoid the Crown Point shaft house, and al-

sion has been that a large hoister of this type would not be practicable. On this account the matter received more than usual attention. Mr. Knowles required a rigid guarantee on power and fuel consumption, with the proviso that the work of erection should not interfere with the use of the steam hoister until the time came to draw the fires under the boilers and depend on the new power entirely.

A general idea of the arrangement can be obtained from the accompanying illustration. It is not intended to offer this as an ideal design for a hoisting plant, as it was a case of making the most of existing circumstances and keeping down first costs; but for economy and ease of operation it will compare very favorably with anything of the kind in use. Mr. Knowles' plan was to couple two Witte gasoline engines to the steam hoist in such a manner that either one or both gasoline engines could be used, and that either steam or gasoline, or both, could be employed for power. This was accomplished in the following manner: A countershaft supported by three bearings is geared to the engine shaft of the hoist by means of a pinion and split gear. The gasoline engines are coupled to each end of the countershaft with a friction clutch coupling. Each engine develops 40 brake H. P. at an altitude of 9000 feet, and were designed especially for the plant, a novel feature being the injection of a small amount of water with the air at each stroke. The evaporation of the water during combustion absorbs some of the heat generated, and the steam produced adds to the expansive power of the charge, the temperature being slightly reduced. Thus a high degree of compression is possible without a premature ignition, and the loss of heat in the water jackets may be reduced 10% to 15%.

The cooling water for the jackets is contained in two tanks, each holding 2000 gallons, and is kept in continuous circulation by a small rotary pump. The gasoline supply is stored outside and below the shaft house and is pumped to the engines as required, the surplus being returned to the tank.

The hoisting operations are controlled from a brake stand placed midway between the engines. One lever operates the band friction clutch on the hoist, another the brake and a third regulates the speed.

The right-hand engine is kept running at half speed when not hoisting and drives the Baker blower which ventilates the mine. When the signal to hoist is given, the engine is brought up to speed and starts the other engine. The drum clutch is then thrown in and the bucket starts. Much of the work requires but one engine.

The plant has been run continuously since first started. The connecting rods to the steam cylinders can be replaced at a moment's notice, but have not been so far, and probably never will be, as gasoline has proven far more reliable than steam in this case.

The mine is worked under two ten-hour shifts. From eighty to ninety tons of ore are hoisted during the day shift and about 160 tons of water during the night shift. Most of this work is done from the 700-foot level. The load hoisted amounts to 6500 pounds, ex-

Crown Point & Virginia Gasoline Hoist, Idaho City, Colo.

ways changed the subject when it was mentioned. The property was purchased by the Colorado-California Shareholding M. & M. Co. in 1899. This company prepared to work the mine on a larger scale than heretofore, and, after losing the old plant of machinery by fire, installed a new 12x16 geared hoist and two 80 H. P. boilers. After a year's experience with the water, steam was found to be out of the question. W. H. Knowles, the manager of the company, after an inquiry into the subject, decided to employ gasoline engines as a source of motive power.

There are a number of small gasoline hoisters used in the district; but the general and popular impres-

sion of friction on the skids and rollers. The shaft pitches about 15° from the vertical, and makes several turns. The fuel consumption for this duty, including the 10 H. P. required twenty-four hours for running the blower, will average about fifty gallons of common gasoline in the two shifts. The cooling water consumption amounts to about sixty gallons per day. In the winter this is supplied by shoveling snow into the tanks.

The marked success of the plant is in a great measure due to the efficient way in which it has been handled by the engineer in charge, who made his first acquaintance with gasoline engines when the plant was turned over to him by the erecting engineer of

the Hendrie & Bolthoff Mfg. & Supply Co. of Denver, Colo.

It is interesting to compare the relative cost of operating the steam and gasoline plants. The steam consumed $2\frac{1}{2}$ tons of coal in twenty-four hours, costing \$5 per ton delivered. To this was added the wages of one fireman for each shift, at \$2.50 per shift, and the cost of hauling water, \$10 per day, making a total daily cost of \$27.50 outside of engineers' wages, which are the same for both plants. The gasoline engine requires fifty gallons of fuel per day of twenty-four hours, costing 20 cents per gallon delivered. The water costs \$1.50 per day and the services of the fireman are dispensed with. The total amounts to \$11.50 per day. This shows a saving of \$16 in favor of the gasoline engines.

The latter have proved to be safe and reliable. The only repairs needed have been battery renewals.

This plant is being watched with great interest by mining men. In many instances the results obtained here could be greatly exceeded; but for mines where the water could not be handled by buckets alone, an installation of this kind would not be advisable.

The Dorcas Pneumatic Cyanide Mill.

Written for the MINING AND SCIENTIFIC PRESS by
PROF. E. F. GROPELLO.

The Dorcas is a custom mill, especially constructed to treat ore from the Cripple Creek district of Colorado. Its capacity is 120 tons per day. The ore, as it comes from the various mines and samplers, is first passed through a rock breaker and a set of coarse rolls, whence it is elevated to the sampling room and there sampled. The average value of the ore treated is \$20 per ton. From the sample room the ore is conveyed to a revolving dryer, and is next passed through two sets of finishing rolls and corresponding screens to be reduced to a 24-mesh fineness. The finished ore is then roasted in a Holthoff-Wetley furnace and conveyed therefrom to the leaching tanks.

The leaching tanks are six in number, 30' in diameter and 44' high, and are fitted with the pipe arrangement used in the pneumatic cyanide process. In the beginning only one-half of these tanks were fitted for the use of the pneumatic process in order

the pulp as this fills the tank. In this way no time is lost and all available time given to the solution to act upon the values in the ore. Once the tank is filled and covered with solution, the compressed air is gradually turned through the perforated air pipes that lie on the top of the filter bottom. Whenever the air comes up unevenly through the pulp, as it sometimes does, following the places of least resistance, this undesirable feature is avoided by placing two men with $\frac{1}{2}$ " iron rods on the tank, who push these rods through the pulp to the filter bottom, thus opening new ways for the air to come through the pulp and thereby spreading the action of the same evenly all through the mass. This point reached, the air is kept on till the assay of the pulp shows at least a 90% extraction. About thirty hours is the time generally necessary to get such result. The air is then turned off and the pulp allowed to settle for about one hour. This time expired, percolation is started and the strong solution drawn off as quickly as possible, following it on top with a weak solution of five pounds of KCy to the ton. Percolation is kept going until the percolating solution shows only traces of gold. Then wash water is applied to displace the remaining KCy solution and leave the tank ready to be sluiced out and the pulp concentrated.

Quickness and high extractions are the special features of this way of treatment. The consumption of KCy, as compared with dead leaching, is not increased by the use of compressed air, as the stronger consumption at the beginning of the operation is compensated by the shorter time of contact of solution with the pulp, this sensibly diminishing the consumption of KCy in the second part of the treatment. Our average consumption for the months of March and April was somewhat less than one pound to the ton.

The one unique feature of our plant is the treatment of unroasted dust, collected in our baghouse and flues, a product of our dry crushing machinery. This product had been formerly sent to the smelters to be treated at high charges.

After much experimenting, the writer came to the conclusion that the mill dust could be treated by cyanide, and a very good extraction obtained, be it roasted or not. Comparative tests were made: Heads, roasted, \$52; unroasted, \$51.20. After treatment the tailings of both tests assayed the same, to wit, 80 cents per ton. In fact, experiment showed that, if Cripple Creek ores could be crushed fine

development which has enabled it to conserve its forces and utilize its resources to the best advantage. The electrical railway alone has added an almost incalculable sum to this country's values. Electrical development of water power has harnessed the sunshine falling upon vast areas, and set it to work in the factory and shop. Electricity has freed innumerable people from manual labor to allow them better opportunities in other directions. This advance has been much more rapid than was the development of steam power that enabled the Yorkshire looms to make cloth for half the world. What its economic results will be, can not be stated, but that they will be of inestimable value to us, can not be denied.—Electrical Review.

An Atlin Hydraulic Mine.*

Written for the MINING AND SCIENTIFIC PRESS.

Exploration of Atlin placer deposits is proving that in the lines of distribution of the gold—the pay leads—there is but little difference between them and the placers of other districts. The source of the gold supply is in the eroded auriferous quartz ledges, several of which have been found in cleaning up the bedrock in the placer diggings. The gold-bearing streams, in building downward and widening the valleys in which they now flow, deposited the gold in what are now, for distinction, termed the old channel lines. In this respect they resemble stream-formed placers in Nome, the Klondike and the Cariboo district in British Columbia. The study made of the Atlin gold-bearing creeks has indicated that the upper portions of the channel are now in place, much as they were before the glacial period, but that the lower portions of the channels have been run over by glaciers, which have picked up and redeposited the gold of the old channel beds in new lines.

The ground is not frozen to the bedrock, as in the Klondike, nor does it freeze down in winter. Mining is thus followed under favorable conditions in Atlin. The hydraulic method of attack, dredgers and elevators can all be operated. The district was discovered late in August, 1898, but only during 1900 was exploitation begun on a scale commensurate with the extent and gold-bearing value of the deposits.

Pine creek was the location of the first discovery, and the upper and shallower placers have been extensively and profitably worked. The Race Horse property, operated under lease by the Pine Creek Tunnel Syndicate, is a large tract of the old channel of the lower portion of Pine creek, where the pay had been more or less changed in location by glacial movement. The exploiting company is largely a local syndicate, of which J. H. Brownlee has been the active promoter and superintendent of the work. Aside from the profit to be derived from successful exploitation, the local promoters have designed to demonstrate, by finding the gold-bearing lead, that it was continuous from the upper workings of the creek—the nearest point, Willow Creek river, being 5 miles distant—even though the bed of the present creek contained no gold. While the theory that the lead was probably continuous and could be found was perfectly comprehensible to an expert, the fact of the actual finding of the lead was needed to convince the practical men who mine. Such pioneer exploration is attended with more than ordinary risk to the money expended, and the men who took the chances are to be complimented for their business courage and congratulated on the success that so soon attended on their enterprise. The discovery has added largely to the workable area of Atlin district and makes possible a number of large operations that should have years of profitable work ahead of them.

The illustration on the front page is a view of the Atlin hoisting works at the successful prospect shaft recently sunk on the Lillian claim of the Race Horse group by the Tunnel Company. In the winter of 1899-1900 a preliminary prospect shaft was put down by hand, finding a pay streak estimated then, from prospecting, to go from \$15 to \$18 a cubic yard. This shaft, being untimbered, caved in at the opening of spring, and the flow of water became too great to be handled by hand.

In November last the Pine Tunnel Syndicate was organized and started to run a 1200-foot tunnel to bottom the shaft. Finding that it could not get to bedrock in that distance, the tunnel was discontinued and several shafts were attempted in its line to verify the bedrock depth; but water stopped them all. Finally, the new shaft shown in the illustration was started, with the steam hoist handling the heavy flow of water with a bucket. Bedrock was reached at 44 feet depth after twenty-four days work of three shifts. The prospects taken from bedrock gravel from this shaft tend to confirm the estimate of gold content made from the prospecting of the first shaft. The ground passed through in sinking was: Surface drift material, 12 feet; bedded silts and gravels, 9 feet; wash gravel carrying pay, 5 feet; unstratified silts and gravels carrying boulders and boulder clay, 5 feet; bedded silt deposit, 8 feet; wash gravel, containing quartz in

*See illustration front page.

The Dorcas Pneumatic, Cyanide Mill, Florence, Colo.

to make a thorough comparative test between this and the old method of leaching. These comparative tests showed that the old method required from ten to fifteen days for the treatment, while by the pneumatic system this was reduced more than one-half and a higher extraction was also obtained, so the remaining tanks were equipped for its use.

The air is supplied by a light-service compressor at a pressure never exceeding five pounds, about 1 cubic foot of free air per minute to each ton of ore being the amount needed to agitate and oxygenate the solution.

Five days' treatment is generally enough to get the values down to about \$1 per ton, when the tank is sluiced out and the pulp concentrated on Wilfley tables. The tailings after concentration average about 40 cents per ton.

I shall not give here any description of the working of our crushing and roasting department, as there are no new features in it and it is practically the same as that of all other mills treating Cripple Creek ores, but I will specialize somewhat about the working of our cyanide department in connection with compressed air.

Our tanks are filled by means of a conveyor. As soon as the filter bottom of the tank is covered with pulp a solution standardized to ten pounds of KCy to the ton is turned on it and gauged so as to follow

enough, cyanide would extract the values from them without requiring a preliminary roast, thus upsetting the theory that raw sulphide and telluride ores would not yield their gold to the cyanide treatment. The actual work proved the truth of this assertion. Now, to each tank three tons of mill dust are added and spread evenly on top of the charge, and then covered with solution. The compressed air supplies the necessary agitation, and the roasted pulp the filtering medium. In this crude way an average extraction of over 92% of the values is obtained at a cost of less than \$2 additional per ton, while the smelter charges for treating this material was from \$12 to \$15 per ton.

It is only beginning to be realized by statisticians and political economists that electricity is a factor of tremendous importance in the development of countries and the peoples. The industrial supremacy of Great Britain, maintained during more than a generation, was due to steam—due to the coal fields of England and the inventive and mechanical skill of the people who utilized the gifts of Nature in the development of their industries and became the foremost manufacturing nation. This country is contesting that supremacy because of superior advantages of the same kind, but a factor of no small importance in the contest is the electrical

abundance, coarse nugget gold, 6 feet. The bedrock is a serpentine, heavily mineralized with pyrite.

[The presence of quartz in such notable amount in the bedrock strata of wash, contrasted with its absence in the covering beds, would indicate that the channel was the original pre-glacial channel in place, rather than the result of a glacier-fed stream or a stream flowing subsequent.—Ed.]

A Mine History from Correspondence.

Mine owners and superintendents twenty-five and more years ago did not keep detail records and plans of a mine's operation. The lack of them, when the expediency of reopening a mine that has been closed down for many years is under consideration, is seriously felt by the consulting engineer whose counsel may be employed. Oral testimony as to why operation was abandoned and as to the nature and condition of mine openings that cannot now be entered and examined is neither fully reliable nor sufficiently complete. Cheaper mining and treatment costs and a more complete beneficiation of the minerals in ores, if the facts regarding the old operation of the mine could be surely known, might show a possible profit margin that would justify reopening it now.

It sometimes happens that the letters of the superintendent or manager written at the mine have been preserved. As letters simply, the information they contain is mentally unassimilable. The facts may be there but their coherence is lost. The purpose with which this is written is to illustrate a practical method of preparing a comprehensive mine history from a correspondence.

The letters employed are a portion of the correspondence of the superintendent of the Holy Terror gold mine, written to the company office in San Francisco.

August 4, 1863.

I have not cleaned up the mill yet, as I wish to crush two more days on ore coming from the upper tunnel, north of the shaft. The ore I extracted south side has not yielded what I expected. I have stopped work in it and will stop the north side to-night. I will continue the shaft on the second vein. I will run a drift 15 to 18 feet to meet the tunnel, which will permit us to take out ore through the incline and enable us to discharge the two men on the whim at the shaft. This shaft is about 80 feet deep. The vein is 2 feet wide. The quartz in the incline is still the same, $\frac{3}{4}$ feet thick.

August 6, 1863.

I ship per express 56 ounces. This quartz not having paid, I last night stopped extraction work. This week I will crush ore from the second vein.

August 10, 1863.

I yesterday stopped all work except in the incline. I cleaned up for three days' crushing 17½ ounces bullion—about \$300.

September 3, 1863.

On arrival this morning I went down the incline, to see for myself. The vein is 2 feet thick. Rock is soft and allows contractors to make 8 or 9 feet per week. I was astonished at the change in the ore. It is the same quartz as at the beginning of the contract. From the 50 feet run by the contractors there are about 25 tons in the mill. To make room for that they are now taking out about 2 tons a day. I shall commence to-morrow crushing day times until Sunday. The ore looks well that is coming out now.

September 28, 1863.

The 60 feet of incline, I think, will be finished Saturday. I to-day asked bids for 30 feet more. The quartz in the incline is whiter—less sulphurets. It is 2 feet thick.

October 6, 1863.

The 60-foot incline was finished Saturday evening; the vein is 18 inches thick and streaked; it is no longer the white quartz we had. I gave the contractors another 30 feet at \$28.

October 15, 1863.

The new contract for incline is down 9 feet; it is thought it will be finished by Nov. 4th. The vein at this depth is 6 inches. Another 10 feet and we will be able to contract the levels. The rock is softer. I expect to commence crushing Friday on ore from north side below the tunnel.

October 20, 1863.

In my last I stated that the vein at the bottom of the incline was 6 inches. To-day the vein has 2 feet width. The quartz, Mr. President, I only wish would continue what it is now.

October 22, 1863.

In my telegram of yesterday I announced 2 feet of quartz; to-day it is 4 feet thick, and with promising sulphurets of lead. The rock is soft. I have crushed for twenty-four hours quartz from the north side; but not having yielded up to the prospects, I have stopped. I am saving the ore from the incline.

November 1, 1863.

The vein is to-day 6 feet; the quartz is fine—that is, in the incline. I have let two contracts to run levels north and south, each 80 feet; they will start 80 feet down the incline. The contractors on the incline sinking will lay off to get them started, so all can work at once.

November 12, 1863.

The vein is still the same. Some magnificent quartz. The level north is in 8 feet, the other not so far. The contractors have commenced on the incline again.

December 1, 1863.

The contract is finished on the incline, which makes us 110 feet of ore to break down. The south level is in fine ore; the face has a 3-foot thick vein. In the incline bottom the vein is 4 feet and rich. The vein is becoming

flat. I have given contract for 10 feet more of incline at \$30. During the time, the contractors on the tunnels will get out nearly their 80 feet. The south end is 55 feet now. A company offer me to take out the quartz from the south level for \$2 a ton to the surface. The ore will enable the mill to keep ten stamps going. I am paying \$13 a foot for the north level, which is a little high. It is now out 62 feet.

December 16, 1863.

The vein is flat, but I think it will resume its dip of 75°; anyway, the ore is superior to that which we have crushed up to the present. The contractors have finished the 10 feet in the incline, and I have given them contract for 60 feet more. The quartz is $\frac{3}{4}$ feet thick. The contractor in the north level has finished 80 feet, and I have given 40 feet more; the quartz was 18 inches thick—not so rich as in the incline. On the south side the vein is 8 feet, but it is not so good.

January 4, 1864.

That what we imagined a division of the vein is a horse. The veins join below the boulder and it has there the same dip. The contractors in the incline have 22 feet now done. I am paying them \$32 a foot. The vein is 7 feet thick and prospects good. In the south the vein was down to 1 inch, but is now 18 inches. The contractors will finish in three days more. I have 225 tons of ore taken out that I think will go \$20 to \$30.

January 10, 1864.

Nothing new to report, the mine is the same as in my last letter. The level in the north advances faster than in the south. The vein is in the north only 3 inches now. The contractors have 28 feet completed.

January 15, 1864.

The vein in the north is now 16 inches and is good ore. In the south the ore is not so good, \$10 to \$15 I think. The new contractors in the south have 10 feet done.

January 22, 1864.

Have crushed five tons for the Razzle Company and ten for the Excelsior. It cost us to do it \$8 a ton, which they paid me. Had I been able to have the level north driven cheaper than \$11 a foot I would not have contracted for that price. The men say they cannot make wages at it and want to give it up. The quartz in the incline looks fine; the contractors are now down 37 feet. I think it will be well to have some more levels soon. Will commence crushing the ore we have now.

February 2, 1864.

Have been crushing now for one week and the plates give us good returns. In the south we have good ore. It is 3 feet thick. The contractors have now 43 feet done.

February 20, 1864.

I finished crushing and ship you 270 ounces of bullion. There was in all nearly 400 tons of quartz. You will see it does not pay us to take all the quartz. The contractors finished the contract on the incline, and I have given them a contract at \$12 to run a second level on the south from 160 feet in the incline. The north level is 133 feet long.

The letters were given to a typewriter copyist with instructions to rewrite them, separating into paragraphs relating to every separate opening in the mine. Where matter was in the letters not relative to a mine opening it was paragraphed separately. These are omitted below as unessential, and the result of the paragraphing appears as follows:

Aug. 4, '63: I have not cleaned up the mill yet, as I wish to crush two days more on ore coming from the upper tunnel, north of the shaft.

Aug. 4, '63: The ore I extracted south side [upper tunnel] has not yielded what I expected. I have stopped work in it.

Aug. 4, '63: Will stop the north side [upper tunnel] to-night.

Aug. 4, '63: I will continue the shaft on the second vein.

Aug. 4, '63: I will run a drift 15 to 18 feet to meet the tunnel, which will permit us to take out ore through the incline.

Aug. 4, '63: This shaft is about 80 feet deep. The vein is 2 feet wide.

Aug. 4, '63: The quartz in the incline is still the same, $\frac{3}{4}$ feet thick.

Aug. 6, '63: I ship per express 56 ounces. This quartz not having paid, I last night stopped extraction work.

Aug. 6, '63: This week I will crush ore from the second vein.

Aug. 10, '63: I cleaned up for three days' crushing 17½ ounces bullion—about \$300.

Sept. 3, '63: The vein [in incline] is 2 feet thick. Rock is soft and allows contractors to make 8 or 9 feet per week. It is the same quartz as at the beginning of the contract. From the 50 feet run by the contractors there are about 25 tons in the mill. They are now taking out about 2 tons a day. The ore looks well that is coming out now.

Sept. 28, '63: The 60 feet of incline, I think, will be finished Saturday. I to-day asked bids for 30 feet more. The quartz in the incline is whiter—less sulphurets. It is 2 feet thick.

Oct. 6, '63: The 60-foot incline was finished Saturday evening. The vein is 18 inches thick and streaked. It is no longer the white quartz we had. I gave the contractors another 30 feet at \$28.

Oct. 15, '63: The new contract for incline is down 9 feet. It is thought it will be finished by Nov. 4th. The vein at this depth is 6 inches. Another 10 feet and we will be able to contract the levels. The rock is softer.

Oct. 20, '63: In my last I stated that the vein at the bottom of the incline was 6 inches. To-day the vein has 2 feet width. The quartz, Mr. President, I only wish would continue what it is now.

Oct. 22, '63: In my telegram of yesterday I announced 2 feet of quartz. To-day it is 4 feet thick, and with promising sulphurets of lead. The rock is soft.

Oct. 22, '63: I have crushed for twenty-four hours quartz from the north side; but not having yielded up to the prospects, I have stopped.

Oct. 22, '63: I am saving the ore from the incline.

Nov. 1, '63: The vein is to-day 6 feet. The quartz is fine—that is, in the incline.

Nov. 1, '63: I have let two contracts to run levels north and south, each 80 feet. They will start 80 feet down the incline.

Nov. 12, '63: The vein is still the same. Some magnificent quartz. The level [80-foot] north is in 8 feet.

Nov. 12, '63: The other [80-foot] not so far.

Nov. 12, '63: The contractors have commenced on the incline again.

Dec. 1, '63: The contract is finished on the incline, which makes us 110 feet of ore to break down.

Dec. 1, '63: The south level is in fine ore; the face has a 3-foot thick vein.

Dec. 1, '63: In the incline bottom the vein is 4 feet and rich. The vein is becoming flat. I have given contract for 10 feet more of incline at \$30.

Dec. 1, '63: The south end is 55 feet now. A company offer me to take out the quartz from the south level for \$2 a ton to the surface. The ore will enable the mill to keep ten stamps going.

Dec. 1, '63: I am paying \$13 a foot for the north level, which is a little high. It is now out 62 feet.

Dec. 16, '63: The vein is flat, but I think it will resume its dip of 75°; anyway, the ore is superior to that which we have crushed up to the present. The contractors have finished the 10 feet in the incline, and I have given them contract for 60 feet more. The quartz is $\frac{3}{4}$ feet thick.

Dec. 16, '63: The contractor in the north level has finished 80 feet, and I have given 40 feet more; the quartz was 18 inches thick—not so rich as in the incline.

Dec. 16, '63: On the [80-foot level] south side the vein is 8 feet, but it is not so good.

Jan. 4, '64: That what we imagined a division of the vein is a horse. The veins join below the boulder and it has there the same dip. The contractors in the incline have 22 feet now done. I am paying them \$32 a foot. The vein is 7 feet thick and prospects good.

Jan. 4, '64: In the [80-foot level] south the vein was down to 1 inch but is now 18 inches. The contractors will finish in three days more.

Jan. 4, '64: I have 225 tons of ore taken out that I think will go \$20 to \$30.

Jan. 10, '64: The [80-foot] level in the north advances faster than in the south. The vein is in the north only 3 inches now. The contractors have 28 feet completed.

Jan. 15, '64: The vein in the [80-foot level] north is now 16 inches and is good ore.

Jan. 15, '64: In the [80-foot level] south the ore is not so good, \$10 to \$15 I think. The new contractors in the south have 10 feet done.

Jan. 22, '64: Have crushed five tons for the Razzle Company and ten for the Excelsior. It cost us to do it \$8 a ton, which they paid me.

Jan. 22, '64: Had I been able to have the [80-foot] level north driven cheaper than \$11 a foot I would not have contracted for that price. The men say they cannot make wages at it and want to give it up.

Jan. 22, '64: The quartz in the incline looks fine; the contractors are now down 37 feet.

Feb. 2, '64: Have been crushing now for one week, and the plates give us good returns.

Feb. 2, '64: In the [80-foot level] south we have good ore. It is 3 feet thick. The contractors have now 43 feet done.

Feb. 20, '64: I finished crushing and ship you 270 ounces of bullion. There was in all nearly 400 tons of quartz. You will see it does not pay us to take all the quartz.

Feb. 20, '64: The contractors finished the contract on the incline.

Feb. 20, '64: I have given them a contract at \$12 to run a second level on the south from 160 feet in the incline.

Feb. 20, '64: The north [80-foot] level is 133 feet long.

The matter prepared by the typewriter in paragraphs is then scissored and the paragraphs taken separately, each with its date, are pasted in the order of the dates under headings designating the several mine openings, shafts, inclines, levels, the mill, etc. Where this is completed the material of the letters is in the following form. It will be noted that words or phrases have been introduced by the typewriter in brackets to make each paragraph clear and intelligible when removed from its context in the letters:

MILL.

Aug. 4, '63: I have not cleaned up the mill yet, as I wish to crush two days more on ore coming from the upper tunnel, north of the shaft.

Aug. 6, '63: I ship per express 56 ounces. This quartz not having paid, I last night stopped extraction work.

Oct. 22, '63: I have crushed for twenty-four hours quartz from the north side; but not having yielded up to the prospects, I have stopped.

Jan. 4, '64: I have 225 tons of ore taken out that I think will go \$20 to \$30.

Jan. 22, '64: Have crushed five tons for the Razzle Company and ten for the Excelsior. It cost us to do it \$8 a ton, which they paid me.

Feb. 2, '64: Have been crushing now for one week, and the plates give us good returns.

Feb. 12, '64: I do not expect to finish crushing for a week yet.

Feb. 20, '64: I finished crushing and ship you 270 ounces of bullion. There was in all nearly 400 tons of quartz. You will see it does not pay us to take all the quartz.

UPPER TUNNEL NORTH OF SHAFT.

Aug. 4, '63: Will stop the north side [upper tunnel] to-night.

UPPER TUNNEL SOUTH OF SHAFT.

Aug. 4, '63: The ore I extracted south side [upper

tunnel] has not yielded what I expected. I have stopped work in it.

SECOND VEIN.

- Aug. 4, '63: I will continue the shaft on the second vein.
 Aug. 4, '63: This shaft is about 80 feet deep. The vein is 2 feet wide.
 Aug. 6, '63: This week I will crush ore from the second vein.
 Aug. 10, '63: I cleaned up for three days' crushing 17½ ounces bullion—about \$300.

DRIFT A.

- Aug. 4, '63: I will run a drift 15 to 18 feet to meet the tunnel, which will permit us to take out ore through the incline.

INCLINE NO. 1.

- Aug. 4, '63: The quartz in the incline is still the same, 3½ feet thick.
 Sept. 3, '63: The vein [in incline] is 2 feet thick. Rock is soft and allows contractors to make 8 or 9 feet per week. It is the same quartz as at the beginning of the contract. From the 50 feet run by the contractors there are about 25 tons in the mill. They are now taking out about 2 tons a day. The ore looks well that is coming out now.
 Sept. 28, '63: The 60 feet of incline, I think, will be finished Saturday. I to-day asked bids for 30 feet more. The quartz in the incline is whiter—less sulphurets. It is 2 feet thick.
 Oct. 6, '63: The 60-foot incline was finished Saturday evening. The vein is 18 inches thick and streaked. It is no longer the white quartz we had. I gave the contractors another 30 feet at \$28.
 Oct. 15, '63: The new contract for incline is down 9 feet. It is thought it will be finished by Nov. 4th. The vein at this depth is 6 inches. Another 10 feet and we will be able to contract the levels. The rock is softer.
 Oct. 20, '63: In my last I stated that the vein at the bottom of the incline was 6 inches. To-day the vein has 2 feet width. The quartz, Mr. President, I only wish would continue what it is now.
 Oct. 22, '63: In my telegram of yesterday I announced 2 feet of quartz. To-day it is 4 feet thick, and with promising sulphurets of lead. The rock is soft.
 Oct. 22, '63: I am saving the ore from the incline.
 Nov. 1, '63: The vein is to-day 6 feet. The quartz is fine—that is, in the incline.
 Nov. 12, '63: The contractors have commenced on the incline again.
 Dec. 1, '63: The contract is finished on the incline, which makes us 110 feet of ore to break down.
 Dec. 1, '63: In the incline bottom the vein is 4 feet and rich. The vein is becoming flat. I have given contract for 10 feet more of incline at \$30.
 Dec. 16, '63: The vein is flat, but I think it will resume its dip of 75°; anyway, the ore is superior to that which we have crushed up to the present. The contractors have finished the 10 feet in the incline, and I have given them contract for 60 feet more. The quartz is 3½ feet thick.
 Jan. 4, '64: That what we imagined a division of the vein is a horse. The veins join below the boulder and it has there the same dip. The contractors in the incline have 22 feet now done. I am paying them \$32 a foot. The vein is 7 feet thick and prospects good.
 Jan. 22, '64: The quartz in the incline looks fine; the contractors are now down 37 feet.
 Feb. 20, '64: The contractors finished the contract on the incline.

80-FOOT LEVEL NORTH.

- Nov. 1, '63: I have let two contracts to run levels north and south, each 80 feet. They will start 80 feet down the incline.
 Nov. 12, '63: The vein is still the same. Some magnificent quartz. The level [80-foot] north is in 8 feet.
 Dec. 1, '63: I am paying \$13 a foot for the north level, which is a little high. It is now out 62 feet.
 Dec. 16, '63: The contractor in the north level has finished 80 feet, and I have given 40 feet more. The quartz was 18 inches thick; not so rich as in the incline.
 Jan. 10, '64: The [80-foot] level in the north advances faster than in the south. The vein in the north is only 3 inches now. The contractors have 28 feet completed.
 Jan. 15, '64: The vein in the [80-foot level] north is now 16 inches and is good ore.
 Jan. 22, '64: Had I been able to have the [80-foot] level north driven cheaper than \$11 a foot, I would not have contracted for that price. The men say they cannot make wages at it and want to give it up.
 Feb. 20, '64: The north [80-foot] level is 133 feet long.

80-FOOT LEVEL SOUTH.

- Nov. 1, '63: [Contract let for 80 feet.]
 Nov. 12, '63: The other [80-foot] not so far [as 8 feet.]
 Dec. 1, '63: The south level is in fine ore. The face has a 3-foot thick vein.
 Dec. 1, '63: The south end is 55 feet now. A company offer me to take out the quartz from the south level for \$2 a ton to the surface. The ore will enable the mill to keep ten stamps going.
 Dec. 16, '63: On the [80-foot level] south side the vein is 8 feet, but it is not so good.
 Jan. 4, '64: In the [80-foot level] south the vein was down to 1 inch, but is now 18 inches. The contractors will finish in three days more.
 Jan. 15, '64: In the [80-foot level] south the ore is not so good—\$10 to \$15, I think. The new contractors in the south have 10 feet done.
 Feb. 2, '64: In the [80-foot level] south we have good ore. It is 3 feet thick. The contractors have now 43 feet done.

160-FOOT LEVEL SOUTH.

- Feb. 20, '64: I have given them a contract at \$12 to run a second level on the south from 160 feet in the incline.

Mining and Metallurgical Patents.

Patents Issued April 30, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS
 DRIVE MECHANISM FOR ORE CONCENTRATORS.—No. 673,058; M. S. Leve, Fruitvale, Cal.

The combination of crank shaft, connecting rod of a length ranging from about two and one-half times down to one and one-quarter times the length of crank, a lever driven by connecting rod, an adjusting block carried by lever and adapted to be set nearer or closer to the fulcrum of lever, and means acted upon by adjusting block to transmit the motion of the lever to the mechanism to be operated.

ROCK DRILL.—No. 673,104; W. Wood, Paterson, N. J.

The cylinder A and guide lugs A' A' thereon, top head B and its guide lugs B' B', the boss B² and holding lugs B³ on head, in combination with the cross piece C matching between holding lugs and having recess c receiving boss, and holes C' C', side rods A² A² extending through guide lugs and holes, spring plate D, springs e e and holding nuts A³ A³.

MAGNETIC SEPARATOR.—No. 673,172; R. McKnight, New York, N. Y.

Combination of an upwardly traveling belt presenting an extended inclined surface provided with a series of projections of magnetizable material, ore and water feeds for the material near the top of the inclined portion of the belt and means for magnetizing the projections, said belt being adapted to subject the material to a prolonged washing operation, the projections being adapted to create eddies in the downflowing current and attract the magnetic portions of the ore, carrying them over the upper end of the incline.

FURNACE FOR ROASTING ORES.—No. 673,174; A. P. O'Brien, Richmond, Va.

Combination of hollow, downwardly tapering, central shaft, revolvably supported and provided with diametrically opposite, tapering sockets or apertures opening into the central cavity of shaft, raker arms having tapered heads fitted into sockets and

abutting at inner ends within cavity of hollow shaft, means for passing a cooling agent through shaft, whereby shaft and abutting ends may be kept cool and means for holding raker arms in position, the construction being such that shaft and arms may be readily removed from or inserted within furnace.

APPARATUS FOR PULVERIZING ORES.—No. 673,195; J. K. Clark, Butte, Mont.

Combination of a pulverizing receptacle, means for agitating it, free comminuting devices presenting plane surfaces which are adapted during motion of cylinder to come into grinding coaction, an inlet to receptacle for feeding ore below level of comminuting devices and an outlet for comminuted ore at a higher level than the immediate entrance of coarse ore to drum, whereby discharge of the comminuted ore is effected by upward displacement of coarse ore introduced.

COAL DRILL.—No. 673,205; M. Hardsogg, Ottumwa, Iowa.

Combination of box or sleeve having smooth interior or bore and provided at one end with arms, a drill feed shaft passing through box or sleeve and between arms, a longitudinal groove in exterior of shaft, a spiral groove in exterior of shaft, narrow in cross section and wide-spaced apart with body of the shaft for wide spaces between spiral of full diameter, leaving exterior of shaft practically smooth to slide in smooth interior or bore of box or sleeve, a driving gear on shaft journaled in end of box or sleeve and engaging with longitudinal groove of shaft for rotating shaft, a feeding gear mounted on shaft within driving gear and engaging with spiral groove of shaft for advancing and receding shaft according to direction of rotation of gear, a collar or sleeve on shaft carried by arms of box or sleeve, a spindle on collar or sleeve, bevel gears connected together and nested one within the other and engaging driving and feeding gears and rotatable on the spindle of the collar or sleeve, and a hub for one of gears having a rectangular exterior to receive a handle for rotating the gears.

HOISTING BUCKET.—No. 673,060; T. J. Pratt, Paterson, N. J.

A bucket having four walls, an automatically closing spring-actuated bottom having upturned sides, forming a shoot through which contents of bucket may be delivered, and a locking mechanism to keep bottom closed when desired.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Atlin M. Co.'s hydraulic plant has been delivered at McKee creek, Atlin, and the flume is being constructed. Fifteen men are now employed on the work, and R. D. Featherstonhaugh, the Supt., says he expects to start piping on June 1.

The floor space of the Treadwell mine machine shop is to be increased, larger coal bunkers are to be provided and the wharf doubled—all during the summer.

The Kuskokwin gold fields in Alaska are reported to be valueless, and prospectors who rushed in on false reports are now stated to be struggling back to the older camps from whence they came.

The discovery of another line of pay is reported in El Dorado creek, in the Klondike. It seems the first workings on what was supposed to be bedrock at 30 feet of depth are in reality on an upper lead or stratum of pay. On continuing the sinking, a depth of 60 feet has been reached without getting bedrock. The bed of the upper wash was a tough blue clay. Under this came boulders, and then a light clay, in which the gold is found. The latter is nuggety, well washed, and pans run high. While the discovery is of consequence, it is probably only local, and does not necessarily open up anything extensive.

ARIZONA.

MARICOPA COUNTY.

The Keystone C. & G. M. Co., J. M. Evans manager, Phoenix, are developing a copper property in the Black Rock mining district, near Wickenburg. It is expected deposits of copper of sulphides will be uncovered in lenticular bodies or on fault fissures. About 1000 feet of development has been done in the surface ores and to a depth of 400 feet. To accomplish drifting planned an air compressor of 54 H. P. will be installed. They also propose the early construction of a furnace for experimental work. The superintendent estimates that the ore may be treated at a cost of not less than \$4 per ton. The ores concentrate about six into one and the average values are great enough to assure good returns when the smelter is erected.

CALIFORNIA.

AMADOR COUNTY.

At the Oneida mine, Sutter Creek, says Supt. Derby, ore is being produced from the 1500 level, enough being taken out to keep the sixty stamps supplied. Drifting is being done on the 1200-foot level—the bottom of the old works.

BUTTE COUNTY.

It is said that the Boston & Oroville Co., which is building a dredger in South Thermalito, has bought a controlling interest in the Continental Dredge Co., working on Lower Montgomery street, Oroville. The company owns 600 acres and the Continental holdings are 125 acres. W. P. Hammon is local manager for the company.

Two drilling machines have lately arrived at Oroville to be used on the Feather river bottom lands. There will then be five of these prospecting outfits at work near Oroville.

A. B. Chambers, Supt. Bloomer Hill mine, Lumpkin, says a tramway will not be built over the hill from the mine to the mill, but a 400-foot tunnel is being put through the hill instead.

CALAVERAS COUNTY.

On the Emma mine, Campo Seco, McSorley Bros. owners, the double compartment shaft is down 100 feet. The ledge shows a black slate gouge and quartz seams, all prospecting in free gold and carrying high-grade sulphurets. The owners have bought 160 acres of land to the south of the mine, through which the vein extends.—The Birdena mine, W. W. Weatherwax Supt., has the shaft down 205 feet, and is beginning cross-cutting.

F. Dunlap, Pres. Oriole M. Co., operating at Angels Camp, states that preparatory work for the erection of a 20-stamp mill will commence at once. The depth of the shaft is now 550 feet. W. E. Everson is Supt.

EL DORADO COUNTY.

The Minnehaha mine has been bonded by A. J. Frochlich of Auburn, Placer county.

R. K. Claibourne says he and his partner have spent the winter in running a tunnel to tap the ledge on the Extra mine at Grizzly.

The 5-stamp mill of the St. Clair mine, Placerville, B. Peters Supt., is running steadily on ore from the 100-foot level.

INYO COUNTY.

Work is to be resumed in the Poleta

mine, Independence, A. Farrington manager. G. Cowser has contracted to sink 100 feet and two shifts will be put on.

KERN COUNTY.

The Butte Lode Co., at Randsburg, has milled thirty-four tons at the Red Dog mill, obtaining \$3950, an average of \$116 per ton. A new gasoline hoist has been installed and a new ore bin and track built.

Work is to be resumed on the Argus Butte mine, near Randsburg, owned by John Rosenfelt Sons, of San Francisco, G. Lewis, superintendent. There is a mill on the mine, but the ore is refractory and has been sent to a smelter, but the cost of transportation is heavy.

NEVADA COUNTY.

The new 10-stamp mill of the Lecompton mine at Grass Valley has been started up. J. M. Kitts is in charge.—Work in the Yuba mine at Maybert has been temporarily suspended by the breaking of the flume furnishing the water power. It will be repaired immediately.

PLACER COUNTY.

At the Eureka mine, on the Forest Hill Divide, 22 feet of good-looking gravel with quartz boulders has been found on a bench on the west rim of the channel. The drift pushed northeasterly has been run 131 feet without reaching bedrock in the channel.

SHASTA COUNTY.

It is reported that rights of way have been secured and a contract for power from the Shasta Electric Power Co. entered into by parties closely connected with the Southern Pacific Co., who propose to construct a standard gauge electric railroad from Kennett to the Bully Hill copper matte smelter, letting contracts for construction within the next three months.

The Mullen and Poorman gold quartz claims, in Lower Springs district, near Redding, have been bonded by J. Pfeffer to M. J. Graham of Montana at \$5000, on the condition of continuous work for eight months.

SIERRA COUNTY.

H. H. Brown and H. G. Read have leased the Rising Sun mine, Alleghany, and are repairing the tunnel.

It is said that a rich strike has been made in the Osceola mine at Alleghany, \$10,000 being claimed to have been taken out in a sixty-hour run with a 2-stamp mill. The rich ore body was struck in a stope some 400 feet from the mouth of the tunnel. The ledge is 2 feet in width and every piece of ore from the pocket shows free gold.

SISKIYOU COUNTY.

The difficulties between the owners of the Bluejay mine, near Henley, are said to have been adjusted. A new company, the Cleve G. M. & Co., has been organized, in which Will & Billings are the principal stockholders, and has taken over Mr. Pool's interest.

The Jillson mine of the Hazel G. M. Co., near Henley, continues to be an excellent paying gold proposition. It is said to have yielded well towards \$1,000,000 since it was opened a few years since.

A mammoth dredger is being constructed on the South Fork of Scott river, near Callahans, by the Pittsburg Co. The lumber, timbers and machinery will be teamed in from Gazelle.

TRINITY COUNTY.

Davis & Gilzean discovered a placer mine on Canon creek near Junction City last December, and have put a tunnel in 50 feet in rich pay gravel. A second tunnel from the other side of the hill has struck pay gravel of the same character. Pan prospects have run from \$4 to \$10 to the pan. The greatest single piece of gold picked up on the bedrock weighed \$15.92. Near the point of discovery six partly filled flour sacks of gravel yielded \$19.35. From another place eighteen sacks of dirt yielded \$15. In five days the two took out twenty-six ounces of gold. They have not worked the mine extensively on account of lack of water.

TUOLUMNE COUNTY.

Operations on the Mapes mine, Yankee Hill, near Sonora, will soon commence, W. E. Coul Supt. The Mapes claim is situated above the Dondero claim, and, besides the gravel placer, contains several quartz ledges.

YUBA COUNTY.

The Miller quartz mine at New York Flat, near Forbestown, has been bought by San Jose people and is to be developed. A contract has been let to run a drain tunnel.

COLORADO.

J. A. Fullerton and J. B. Grove, formerly connected with the Colorado-Philadelphia Reduction Works, propose building a mill to have 400 tons daily capacity and estimated to cost \$550,000. The money has been subscribed, it is stated, by Lon-

don and New York people. A new process will be employed instead of the cyanide.

ARAPAHOE COUNTY.

The deposit of gold with the U. S. Branch Mint at Denver is steady; comparing, as follows, for 1900:

January.....	\$1,567,368 58
February.....	1,349,673 74
March.....	1,572,039 43
April.....	1,352,454 79

Total.....\$5,841,536 54

1901.

January.....	\$1,406,081 97
February.....	1,343,480 44
March.....	1,516,189 57
April.....	1,629,230 55

Total.....\$5,894,982 53
Gain for 1901.....\$53,445 99

BOULDER COUNTY.

The Melvina mine of Wall Street camp, Boulder, has received from the Denver S. & R. Co. some remarkable values for four cars of ore recently shipped. One lot of 3255 pounds netted \$398.20; one lot of 1702 pounds netted \$500.85; one lot of 143 pounds netted \$581.20, and one lot of 53½ pounds netted \$1072.90. It will be seen that the rich ore ran \$20.04 per pound and the next grade \$4.07 per pound, while the lowest grade ran nearly \$200 per ton. The total received was \$4938.30. The shipments represented the work of twenty men, and expenses were \$1650, leaving a net profit of \$3250 for one month.

GUNNISON COUNTY.

R. W. Spensley, general manager of the Dora M. Co., has gone from Gunnison into Union Park with supplies to commence early work on the Union Park placers. During the season last year several miles of ditch and flume were built to bring water to the ground. This season the ground will be washed.

The Taylor Park M. Co., near Gunnison, in the Tin Cup district, is expected to do extensive placer mining this season. This is a Boston enterprise, with T. T. Goodale, as manager. The company also owns the enterprise mine, near Dorchester, which has been equipped with \$15,000 worth of machinery.

HINSDALE COUNTY.

The Ute and Ulay mines, near Lake City, have been bought by a Colorado company, of which S. D. Nicholson and J. Rodman of Leadville are the principals. The property has been developed, the shaft in the Ulay now being 1300 feet deep. A 200-ton concentrating plant has been erected and a tramway connecting the Ute with the mill. The new owners expect to expend \$75,000 or \$100,000 in further development.

LAKE COUNTY.

The Yankee Doodle mine, C. Spencer, Supt., operated by a leasing company composed of miners and business men of Leadville, has had its machinery plant destroyed by fire. The property was in dividend form, shipping forty tons of ore daily, which netted the lessees between \$3 and \$4 per ton. The plant will be rebuilt.

PARK COUNTY.

Ore running \$500 per ton has been struck in the London mine, near Alma, the streak averaging from 8 inches to 2 feet in width. J. Kuhn is leasing the mine.—The Champagne Fanny, worked under lease by Mints & Schumaker, has developed a small mineral streak from 3 to 4 inches wide, assaying 781 ounces silver and 3.6 ounces gold.

PITKIN COUNTY.

A rich strike has been made in the tenth level of the Mollie Gibson mine, Aspen. Returns show from 150 to 600 ounces in silver. It is claimed that the ore shoot extends to the surface, a distance of 1000 feet.

SAN JUAN COUNTY.

Milwaukee people, headed by A. Blatz and J. C. Koch, have bought the Alta group in Gold King basin, near Telluride, for \$175,000 cash. It is understood that the purchasers will operate the group with the Bessie mine, already owned by them. The Bessie main tunnel will cut the main veins of the group at great depth.

TELLER COUNTY.

The Pike's Peak power plant has started operations and is furnishing light to the buildings and mines of the Woods Investment Co. in Victor.

The company owning the Moose and Victor has resumed sinking below 1000 feet. The company believes that it will improve its chances with depth and will sink to 1500 feet.

A tunnel to drain to great depth the Cripple Creek mines is projected. The enterprise is promoted by Engineer L. H. Von Ruecau and his associates, who state that sufficient capital has been interested to insure the construction. The promoters ask for the agreement of the mine owners

to pay a royalty when it shall have been demonstrated that the tunnel will drain their property. The tunnel will be between 5 and 6 miles long, with the portal at Four-mile, between Wilson and Cripple Creek, and it will cut under the apex of Bull hill at a depth of 3700 feet. Laterals will tap all the important sections of the district. The project is estimated to cost about \$5,000,000.

IDAHO.

BEAR LAKE COUNTY.

The shareholders of the Bear Lake C. M. Co., owning the Humming Bird group at Paris, have elected A. H. Tarbet president and W. G. Benham secretary. It was decided at the meeting to begin active work under the management of President Tarbet.

BLAINE COUNTY.

Ore has been struck on the 360-foot level, north, in the Minnie Moore mine at Hailey. It is mostly concentrating ore, but some is first-class. The operators hope to ship a carload a day from it.

IDAHO COUNTY.

Placer season is backward three weeks later in beginning than in 1900.—Idaho Development Co. of Lewiston is putting in supplies preparatory to opening an old channel lying between Newsome and Leggett creeks. A 5-mile ditch is planned.—J. Turner has a ditch on an old channel near Newsome and is preparing to hydraulic.—It is reported that the Ajax mine at Dixie, owned by Finch & Campbell of Spokane, is looking finely, with the shaft down 300 feet and drifts showing several hundred feet of shoot, with a 12 to 18-foot vein.—A strike is reported on the 200-foot level of the Vesuvius at Buffalo Hump.

Newsome, April 25.

H. T. Wright has bought the Last Chance and Pomeroy mines at Atlanta for about \$15,000. It is expected to begin work at once.

KOOTENAI COUNTY.

The August and Sunset copper claims, near Old Mission, have been bonded for a short time by Butte people, who propose to develop them this summer.

G. W. Runkle says the Lolo Pioneer G. M. Co.'s properties in the Musselshell district are working twenty-two men. S. Grant, one of the principal stockholders, is expected from Detroit, Mich., to examine the property to determine whether or not a 20-stamp mill shall be put on this summer.

LINCOLN COUNTY.

Two companies—the Sweetser & Burroughs and Yale—are said to be making a great success with their dredging boats on Snake river, below Minidoka. The two boats employ about seventy men.

OWYHEE COUNTY.

The Poorman mine, Silver City, F. A. W. Gerling Supt., has sixteen men at work on the 350-foot level of the Belle Peck winze, 2000 feet in the tunnel.

On account of influx of water at Trook & Jennings mine, bonded to Norton, Irwin & Matterson, work in the shaft has been shut down and the level south on the vein is being run.

SHOSHONE COUNTY.

It is said the Gold Hunter M. & S. Co.'s mines at Wallace have been sold to J. Murray of Butte, Mont.

MICHIGAN.

HOUGHTON COUNTY.

It is reported that the Osceola copper mine is preparing to increase its output from 12,000,000 pounds to 20,000,000 pounds per annum, and at a very much reduced cost per pound.

MONTANA.

BEAVERHEAD COUNTY.

G. W. French of Dillon and A. French of Argenta have bonded the Gold Finch and Dolphin mines, in the Argenta district, to W. H. Remington of Tacoma, Wash., for \$20,000. The two mines are gold bearing and have been developed by shafts. It is said the intending purchaser will build hoisting works.

FERGUS COUNTY.

The Great Northern M. & D. Co., at Gilt Edge, has been operating the Chicadee group about three years and has a cyanide plant reducing 4500 tons monthly. Over 100,000 tons of ore have already been milled and the company estimates 600,000 tons blocked out.

The cyanide plant of the Central Montana Mines Co., in Whiskey gulch in the Judith range, has been running at half capacity for two months owing to shortage of water. Treating 100 tons of ore daily the production is said to be \$13,000 monthly.

The New Year Gold Mines Co., at New Year, is preparing to operate a bucket tramway from mines to mill, 1 mile apart. The ore exposed was too low grade to

stand the cost of wagon transportation, but with the tramway the new cyanide plant will be able to treat the great bodies of low-grade gold ores. The tunnel is now in over 1000 feet and cuts into the lime-porphry contact. Drifting along the contact is being prosecuted steadily.

Finch & Campbell of Spokane, who have the Kendall mines in the North Moccasin mountains bonded, have leased from O. Stephens a water power of Warm Spring creek on the ranch of the latter. A pumping plant will be installed at once and part of the water is to be piped 5 miles to the mines to be used in the cyanide plant. The lessees are said to propose the putting up of an electric power plant to generate power for their own mill and for other cyanide plants now under construction in the district.

Lowiston, Montana, April 27.

LEWIS AND CLARKE COUNTY.

The East Helena smelter has been closed down for an indefinite period. The closing down will cause many of the lead mines to shut down, and the concentrators will also shut down, because they cannot sell the concentrates. It is probable that the closing will affect the plans for the building of the new Missouri river dam at Stubbs' Ferry.

The Robinson G. M. Co. is beginning work on Bear gulch, constructing a water power plant. On its completion work will begin in both mine and mill.

The Imperial Montana M. Co. has sent men to the Blackfoot ceded strip to open the road to its mines.

The Uncle Sam mine, near Helena, has shut down, owing to the breaking down of the old mill. A new mill will be put in.

It is said that C. E. Damours will take up the bond on the Kearsarge mine at Summit and that a mill will be erected.

MADISON COUNTY.

G. Salisbury and R. R. Smith of Grand Forks, North Dakota, have become interested in the General Shafter mine at Summit. It is said they will put in a 5-stamp mill and a cyanide plant at once.

PARK COUNTY.

The Standard M. Co. at Livingston are preparing to construct a stamp mill and are putting other machinery on their mines. C. R. Murdock is Supt.

NEVADA.

ELKO COUNTY.

C. E. Woodward and W. J. Eastman are reported to have received \$5000 from the Montana Co., Ltd., of Marysville, Mont., for the Hidden Treasure mine, at Bull Run, upon which the option was given some time ago.

The Ely M. Co., at Ely, has taken out \$7000 from about 900 tons of ore.

ESMERALDA COUNTY.

Leasers at Tonopah every 100 or 200 feet apart on the ledge are stopping out the ore from the surface all the way down to 50 feet, gutting the mines for a quick crop, and taking out the roof. The sale for \$350,000 is reported off, it is said, over difficulties relating to the lease and town site.

STOREY COUNTY.

The mill at the mouth of Sutro tunnel is working on rock from the waste dump, which returns less than \$3 per ton.

WASHOE COUNTY.

W. C. Williams, a miner of Olinghouse, has cleaned up \$2691.10 from seventy-one tons of ore worked at the Slip mill. Eight men are employed at his mine.

S. Francovich, L. D. Piazza and A. Dondero have milled eighty-six tons of ore from the Cabin No. 2 claim at Olinghouse, from which they cleaned up \$6000.

OREGON.

DOUGLAS COUNTY.

Jansen & Monroe, who have been placer mining on Canyon creek, say that the claim produced an average of \$5 a day to the man. Of twenty acres, not one acre has yet been completely washed, but \$22,000 has been taken out. The gold is coarse.

GRANT COUNTY.

The Gold Bug-Grizzly at Sumpter, operated by J. J. Hennessey and J. Helberg of Spokane, is to have a new plant. The machinery has been ordered, which will include a 50 H. P. hoist with a boiler and a large sinking pump. The property is said to have a promising quartz showing.

JOSEPHINE COUNTY.

At the Braden mine, Gold Hill, lumber is being delivered for an additional five stamps to be added to the 10-stamp mill, and concentrators have been ordered. Ultimately a 60-ton per day capacity cyanide plant will be put on. C. Ray is manager.

The sale of the J. W. Thomason quartz mine, near Placer, to J. Lewis and W. P. Gilkeson of Seattle is announced. They will put men at work to continue development.

It is reported that the smelter on the

Strong group, near Waldo, is to be started soon, and that 100 men will be employed. All the supplies for the works are on the ground. The owner of this group is T. W. M. Draper of San Francisco.

The Granite Hill mine, near Grants Pass, is owned by J. O. Booth and C. L. Mangum. The vein is in granite and the ore free milling. There is considerable development, consisting of 250 feet of tunnel on the ledge, a shaft down 160 feet, and a 5-stamp mill.

Operations have been resumed at the Eureka mine at Selma. A. T. Nelson is superintendent.

The "Roaring Gimlet" quartz mine is located near Gold Hill and is operated by Sanburn, Sutton & Rease. The ore taken out is said to be full of gold.

LANE COUNTY.

Graber Bros. & Zinaker, at Bohemia, in their 350-foot level, struck a 2-inch wide rich lead, said to be lined with gold. Harlow & Stocks have cut their vein 50 feet deeper, and find it rich as above. Sears & Whipple, have caught the ledge in a tunnel at a depth of 150 feet. The vein is 4 feet wide and prospects free gold.

SOUTH DAKOTA.

CUSTER COUNTY.

The shaft of the Mayflower mine, operated under bond by F. C. N. Graydon of Custer, is down 200 feet. The vein is 4 feet wide and now carries bismuth and tellurium associated with the gold. The Newark vertical shaft has cut a blind vein, said to be very rich. At the North Star the vein in the 300 level is said to be 7 feet wide and good ore. The Clara Belle, near Custer, owned by F. Herbert, is said to be producing rich ore. A company is projected to operate this mine and build a mill. A strike is reported in the University group on Spring creek of nearly solid pyrites assaying \$60 a ton. C. R. W.

Custer, S. D., May 5.

UTAH.

WASHINGTON COUNTY.

The New Haven syndicate, purchasers of the Dixie mine and smelter at St. George, have made another payment of \$25,000, increasing the total paid to \$100,000, with an equal amount still payable before the deeds are released.

JUAB COUNTY.

The site for the Centennial-Eureka Co.'s \$300,000 smelter at Eureka has been selected and B. Holden, managing director, said breaking of ground would commence in a short time, as the plans prepared by G. K. Fisher are with the company at Boston.

Supt. Guenther of the Yankees at Tintic reports the ore body as increasing in size. C. Ford has contracted to build a 300-ton ore bin. A wagon road 1000 feet long, to connect the ore bin with the main wagon road, has been commenced.

In the Tesora at Tintic a strike at a depth of 375 feet has opened up a blind vein parallel with that of the main vein. It was made in a crosscut to the west 13 feet distant from the original. The mill will be completed and in operation by June 15th.

In the West Morning Glory shaft, at Tintic, a flow of water has compelled the temporary suspension of work. It is expected that arrangements will be made for a pump and steam hoisting plant, as the intention is to continue sinking below the water level before crosscutting again.

The Alice M. Co. has incorporated to operate a group of five claims in Tintic district, capital \$30,000: G. C. Lambert is president and H. B. Cole is secretary and treasurer.

PIUTE COUNTY.

The Sevier Con. M. Co., R. B. Parker president, operating on Gold mountain, have bought the Kanosh claim from C. C. Crane. With this the company obtains 65 acres in the heart of the gold-bearing zone and work begins upon ore from the start. The company has no mill as yet.

SALT LAKE COUNTY.

The semi-annual report of the Highland Boy M. Co., which begins with July 1 and ends December 31, 1900, states:

Sales of gold.....	\$ 88,373
Sales of silver.....	33,378
Sales of copper.....	411,931

Total.....	\$533,683
Less freight, commissions, etc.....	50,754

Balance.....	\$482,928
Lead ore sales.....	1,261

Total.....	\$484,190
Mining, development and smelting expenses.....	233,987
Expenses at New York.....	14,724
Interest.....	1,734

Net income.....	\$271,151
The earnings were derived from 40,103	

tons of ore that were treated during the half year, or an average of less than 225 tons a day. The smelter capacity has since been doubled and the average treatment now is over 500 tons daily.

SUMMIT COUNTY.

The Daily-West of Park City produced in April 2600 tons of shipping ore and concentrates, while the mill was supplied with 140 tons daily.

TOOLE COUNTY.

The report upon Con. Mercur operations for April shows that during the month 24,000 tons of ore, or an average of 800 daily, were handled. The headings from the cyanide plant indicate an increase in the value of ore, and a corresponding increase in earnings over March, during which they were stated to over \$150,000.

WASHINGTON.

CHELAN COUNTY.

Work has been commenced on the 13-mile long railroad from Lake Chelan to the Holden mines. The line, which is being constructed by the Chelan T. & S. Co., will be an outlet for a large volume of medium grade ore.

PIERCE COUNTY.

The Tacoma Smelting Co. has bought twenty-five acres adjoining the smelter property for \$22,500. The adjacent tide lands have also been bought, giving an additional water front of 1200 feet. Upon this land an extensive copper plant and lead refinery will be built, enabling the smelter to turn out gold and silver bullion, in place of the present copper product, which has to be shipped for refining. The capacity of the smelter will be increased from 400 to 700 tons of ore daily. The 300 men employed will be doubled. The cost of the new plant, it is estimated, will be nearly \$500,000. The smelter is controlled by D. O. Mills and others interested in the Treadwell and Bunker Hill & Sullivan mines.

SKAMANIA COUNTY.

E. A. Sessions of Portland, Or., secretary Cascadia M. & D. Co., operating the Polar Star group, in St. Helens district, says the problem of the district is transportation. At present the copper ores carrying gold and silver are shipped to the Tacoma smelter at great expense, but the extension of the Vancouver & Yakima Railroad and construction of a smelter at Portland would open up the district.

STEVENS COUNTY.

It is reported that Philadelphia people propose to buy the Silver Butte group, near Northport, for \$200,000. The prospective buyers already own the Great Western, adjoining. It is a silver-lead property.

WYOMING.

ALBANY COUNTY.

Lynn & Kinneman have completed their contract to sink 50 feet on the Copper King and have about four tons of 65% ore on the dump.

FOREIGN.

BRITISH COLUMBIA.

W. I. Reddin of Rossland says, after returning from a visit to the Similkameen country, that "besides the showings of copper ore on Copper and Kennedy mountains the outlying districts tributary to the town of Princeton give promise of great mineral wealth. Probably the most important asset of the district is the coal measures. The most important are those immediately surrounding the town of Princeton. Here is a well-defined coal basin, probably comprising an area of 50 square miles, every acre of which has been located during the past month. No less than six other representatives of capital were in camp at the same time that I was, locating and acquiring coal lands. This coal deposit has long been known, but no attention was paid to it on account of the lack of transportation facilities, and the news that the railroad is to be built caused the stampede to take it up. Alex. Sharp, the coal expert, for many years with the Dunsmuir, has acquired 8000 acres of land for his principals, Messrs. Burns, Marpole et al. The measures contain three seams of coal of 7 feet, another of 14 feet, and a third of 35 feet. The first seam is a lignite, the second bituminous, and the third and thicker seam, as far as can be determined at present, appears to be anthracite. The various parties interested are making preparations to develop at once, and the present summer will witness much activity in the coal section around Princeton. I secured a block of 6000 acres for myself and associates, which will be developed at once. The copper mining section, which is close to these measures, will necessarily make a market for the coal. Besides this the Boundary country, which is only 125 miles away, will of necessity purchase its coal and coke in the Similkameen country

because it is closer than are the Crow's Nest collieries."

J. R. Lee, manager of the Texada iron mine, states that forty men will be brought from Seattle to work on the property on a large and systematic plan of development. The mine is owned by the Puget Sound Iron Co. The deposit is said to be very large. A railway 3 miles in length will be built from the mine to Gillis bay, and ore will be sent to the Iron-dale smelter. It is proposed to ship eighty tons of ore per day this year. Smelting works will eventually be erected on the ground.

The ore shipments from Phoenix for the first four months of 1901 by the Miner-Graves syndicate to the smelter at Grand Forks are 73,522 tons, an average of 610 tons daily.

It is reported that New York people have bought the Tecumseh and Tuscumbia claims for \$18,000, payable in four months. The claims are in Windermere district and are extensions of the Iron Cap, also purchased by New York parties.

G. McFarland of Nelson has received the contract for building the concentrator and compressor plant building at the Enterprise mine on Ten Mile. The plants are expected to be in operation by next September.

The Union Jack group, the Jumbo and Florence, at Lardeau, are bonded to a Minneapolis syndicate.

NOVA SCOTIA.

The gold mining industry for 1900 shows a considerable improvement on 1899, the production being 30,399 ounces, against 27,772. The average yield for the whole province is 9.25 dwts. per ton. The Richardson mine paid in dividends \$26,500, expended in machinery and lands \$15,000, and put \$5000 into a sinking fund. The total profits for the year amounted to \$46,500 from an average gold yield of \$3 per ton of ore. The Richardson Co. proposes adding twenty stamps to the mill and four concentrators.

MEXICO.

Over 150 Americans are employed at the Moctezuma C. Co. at Placeritas de Nacosari, Sonora; Phelps, Dodge & Co. of New York are the principal owners, and the output is controlled by the Amalgamated C. Co. The final surveys of the railroad from these mines to Bisbee have been made, and grading and track-laying are being actively pushed forward in the vicinity of Fronteras. A preliminary survey is soon to be made to some point on the west coast of Mexico.—The Vacuero mine, 5 miles north of Placeritas de Nacosari, is working with a few men. The ore is used by the Moctezuma C. Co. as a flux.—The San Miguel M. Co. have shut down their mill, having bonded their copper properties south of the Portico mountains.—Watson & Catlett have been operating the cyanide plant on tailings from the Creston de Oro mine.—The owners of the Monton de Cobre mine have made a test shipment of copper ore to the Placeritas smelter, with net results of over \$37 per ton. This property consists of ten pertenencias and is situated 15 miles east of Placeritas de Nacosari, on the Arroyo del Alisos. The values are found in azurite and copper glance running well in gold and silver.—The Prospector mine has shut down and the machinery of their stamp mill has been moved to Placeritas. This property was worked for many years by the Kirk Bros., and has been a steady producer.—The Co-chise mine is shipping ore by burro pack-train to San Miguelito. It is situated 15 miles north of the Prospector mine and has produced rich silver ore from pockets.—In the Caballona section, north of Fronteras, Short & Co. have a shaft down over 100 feet on their copper property. They have 120 pertenencias, situated 6 miles from the new railroad. Assays from the surface ores gave a return of 40% copper, 45 ounces silver and .4 ounce gold to the ton. The best values are found in gray copper and iodide of silver.—Three miles south of the Short mine, Kirk Bros. & Co. are down over 100 feet in an iron blow-out, which assays well in copper.—More than 100 men are employed by the Lampazos Co., 40 miles south of Moctezuma. This property, now owned in Hermosillo, was formerly operated by an English syndicate, who extracted over \$2,000,000 in silver from its workings.—A few men are employed at the Gavilan mine, which has been reopened. It is owned by the Corralitas Co. of Chihuahua. J. M. H.

Lohuripa, Sonora, Mexico, April 28.

The La Cumbre mine, near Guadalupe y Calvo, Chihuahua, has been bought by Dr. C. Foster, of 31 Nassau street, New York, and associates, who propose to put in a 40-stamp mill at once.

At El Copete, about 25 miles east from Carbo, Sonora, the Melzer M. Co. have blown in their 200-ton furnace and are turning out twenty-five to thirty tons of copper matte daily. There are now fifty-

two 10-mule teams hauling coke between Carbo and El Copete, and eleven teams hauling supplies and timber.

It is reported that the final payment has been made on the Mulatos mine, in the Sahuaripa district of Sonora, by the Pennsylvania people who have been in possession under a working bond. The price was \$350,000 gold and the sale includes a concession of 10 kilometers square. A 250-stamp mill is to be erected, and numerous other improvements are contemplated.

SOUTH AFRICA.

The Meyer and Charleton mines, Johannesburg, have been started again.

TASMANIA.

The quantities and values of minerals exported from Tasmania during the month of February, 1901, are:

	Value.
Copper ore, 157½ tons.....	\$110,000
Copper (blister), 85½ tons.....	400,000
Gold, 4243 ozs.....	75,000
Gold pyrites, 85 tons.....	2,600
Silver ore, 126½ tons.....	105,000
Tin, 153½ tons.....	93,000
Oxide mineral, 1 ton.....	50
Total.....	\$785,650

Personal.

R. G. WILSON of Salt Lake City, Utah, is in California, examining mines.

J. M. LIBBY of Reno is now Supt. Wadsworth mill, in Olinghouse district, Nev.

WM. C. RALSTON, Supt. Melones mine, at Robinson Ferry, Cal., is in Boston, Mass.

H. L. JOHNSON, Supt. Oriental mine, Alleghany, Cal., is in Denver, Colo., for a short time.

THOS. H. SHERRARD of the U. S. Geological Survey, Washington, D. C., is in Phoenix, Arizona.

FRANK MOREHOUSE, who has been examining mines in Mexico, has returned to Salt Lake City, Utah.

DANIEL SAYER, Supt. Butterfly-Terrible mine, Ophir, Colo., has returned there from a visit to Mexico.

W. E. COUL, formerly Supt. Stockton gravel mine, now occupies that position at the Mapes mine, Sonora, Cal.

L. C. DORY, formerly of Eureka, Utah, has accepted the superintendency of the Robust M. & M. Co., at Ely, Nev.

M. CLERE, M. E., of Paris is in Atlin, B. C., directing the opening of the mines of the Lamare Syndicate of Paris.

R. LECKIE-ewing, superintendent of the Empire mines, Lardeau, B. C., will shortly return there from London.

G. H. McDONALD of Ashland has accepted the position of foreman at the Braden mine, Gold Hill, Oregon.

E. C. UREN, superintendent of the Shawmut mine at Shawmut, Cal., has returned there from a trip to San Francisco.

PROF. H. C. BEELER of Cambria, Wyo., has been appointed State Geologist of Wyoming. He is the first to fill the office.

FRANK HARRIS, manager of the Great Northern M. Co. mines in Oregon, has returned there after several months absence in New York.

E. STEWART, formerly Supt. Ajax mine, Tintic, Utah, but who has been in Mexico for some time, is visiting Salt Lake City, Utah.

WM. VAN SLOOTEN, M. E., of New York has gone to Peru to examine mines there in which he and other New York people are interested.

L. GILSON, manager of the Utah Gold Refinery at Salt Lake City, Utah, is in Montana, laying out the season's development work on properties in which he is interested.

J. H. STRITE, foreman of construction for the Fraser & Chalmers Co. has gone from Redding, Cal., to Irondale, Mo., to superintend the construction of a reduction plant.

W. W. WAGONER, county surveyor of Nevada county, Cal., is an applicant for the position of Debris Commissioner of California, to fill the vacancy made by the death of John F. Kidder.

R. D. FEATHERSTONHAUGH, manager Nimrod Syndicate, Ltd., placer mine at Atlin, B. C., has been appointed to a similar position with the Atlin M. Co., operating at the same place.

W. A. FRITCHARD, superintendent of the Keystone Con. mines at Amador City, Cal., has been in San Francisco during the week in connection with new stamp mill to be put on the mine.

H. T. NEWELL, chief hydrographer, of Washington, D. C., has been examining the Carson river in Nevada with reference

to the irrigation storage surveys now being made by the U. S. Geological Survey.

J. G. DAVIS of Juneau, Alaska, has returned there after a trip through the mining sections of Oregon, Colorado, Utah and Idaho, examining processes in use, with a view to their adaptation to Alaska conditions.

Commercial Paragraphs.

THE Ericsson Telephone Co. of 296 Broadway, New York, have received an order from the War Department Signal Office at Washington, D. C., to ship 200 of their telephones to Manila, P. I., as the result of a favorable report on their use in that place by the department during the last year.

BAKER IRON WORKS, Los Angeles, have just closed a contract with the Alamitos Land Co., Long Beach, for a large pumping plant, consisting of Worthington triple expansion condensing pump, 9 and 14 and 22x15x18 and one 85 H. P. Atlas high pressure boiler. The capacity of the plant is 3000 gallons per minute.

THE New Process Raw Hide Co., Syracuse, N. Y., has recently added considerably to its equipment by the purchase of new machinery, including three Gleason bevel gear planers, which plane the teeth accurately to cone lines, and an additional automatic spur gear cutter, and is now in the market to make metal gears to order in addition to its well-known New Process noiseless pinions.

FOR over thirty years Denniston's San Francisco Plating Works were at 653-655 Mission street, but increasing business necessitating more room, the establishment has been removed to 743 Mission street, between Third and Fourth streets, where it now has a most complete and extensive plating works embodying all the latest improvements in the art. Note the change of address.

THE Pelton Water Wheel Co. of San Francisco and New York is credited with having recently received a pipe order of considerable magnitude from Singapore, India. This consists of 26,000 feet of sheet steel riveted pipe, varying from 24 to 20 inches in diameter, and aggregating about 600 tons in weight. The order also includes a large number of hydraulic giants and elevators—the installation being intended for use in connection with one of the large tin mines, which are so numerous in that locality. This order was secured against active competition with the foreign markets, which speaks well for a local concern.

Books Received.

"Tunneling," by Charles Preline, C. E., published by D. Van Nostrand Co., 23 Murray and 27 Warren Sts., New York, 310 pages, 8vo. The author has written a very excellent work for the student of railroad engineering. Modern construction, its methods, reasons and tools, are simply and clearly explained. Tunnel lining with iron and masonry, construction with shields, and submarine tunnels are so discussed as to clearly elucidate the successful practice of engineers. Price \$3.

The eleventh annual report of the State Board of Trade of California has been published for free distribution on application made to it at San Francisco. It is twenty-five pages of statistical figures and notes dealing with the industrial production of the State in readable, comprehensive form. Mining is not overlooked in the compilation, there being several pages devoted to it. The information given is reliable and valuable for reference.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR WEEK ENDING APRIL 30, 1901.

- 673,106.—ARC LAMP—S. H. Anderson, Pasadena, Cal.
672,931.—NECKTIE HOLDER—H. W. Ayres, Los Angeles, Cal.
673,073.—LIQUID AIR VESSEL—G. A. Bobrick, Los Angeles, Cal.
673,134.—GATE—O. K. Cleveland, America, Cal.
672,974.—PHOTO-PLATE HOLDER—H. A. Clifford, S. F.
673,016.—MOWING MACHINE—C. C. Coffinberry, Union, Or.
673,135.—SEED DRILL—H. A. Denny, Reardan, Wash.
673,118.—REFLECTOR—J. T. Edwards, Weaverville, Cal.
673,255.—FISH DRESSING MACHINE—S. Haigh, S. F.
672,940.—PIPE WRENCH—A. Heberer, Alameda, Cal.
673,263.—TIMBER HOOK—Hitchings & Lachappelle, Hoquiam, Wash.
672,981.—SEPARATOR—R. W. Jessup, S. F.
672,982.—SEPARATOR—R. W. Jessup, S. F.
673,023.—GARMENT SUPPORTER—J. Jorgenson, S. F.
673,053.—CONCENTRATOR—M. S. Leve, Fruitvale, Cal.
672,949.—VEHICLE AXLE—A. C. Massey, Los Angeles, Cal.
673,213.—SCALE—J. A. Menard, Phoenix, A. T.
673,216.—STAPLE—W. H. Morehouse, Wasco, Or.
673,142.—STAMP AFFIXER—A. H. Schaar, S. F.
673,068.—VALVE PISTON—J. P. Simmons, S. F.
673,031.—BABY CARRIAGE—A. H. Schleuter, Oakland, Cal.
673,180.—VAPORIZER—H. G. Tassell, S. F.
673,304.—CULTIVATOR—B. D. & F. M. Sharp, Athena, Or.
671,371.—STEPPER—J. T. Thorp, Corvallis, Or.
673,330.—TICKET CASE—J. E. Waldeck, Los Angeles, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT GRADING MACHINE.—No. 672-453. Dated April 23, 1901. S. McGarvin, Fresno, Cal.

This invention is designed to grade fruit into different sizes, and consists of inclined screens disposed in parallel planes with an imperforate conveyor beneath and parallel of each screen, and in the plane with and a part of the succeeding screen. Means are provided for horizontally reciprocating the frame and projecting the fruit through the machine and contrary to the force of gravity. Means are provided at the end of each screen whereby the varying grades of fruit thus segregated are discharged.

FISH DRESSING MACHINE.—No. 673-255. Dated April 30, 1901. Samuel Haigh, San Francisco, Cal., assigned to Alaska Packers' Association, of same place.

This invention is designed to receive the entire fish at one end of the machine, and to successively remove fins, head, tail and to disembowel and clean the fish, and place it in condition to be subsequently cut up, introduced into cans or otherwise packed. It consists of mechanism for guiding and transmitting the fish through the various operations mentioned, so that these operations are successively completed.

GARMENT SUPPORTER.—No. 673,023. Dated April 30, 1901. John Jorgenson, San Francisco, Cal., one-half assigned to A. Quade, of same place.

This invention is designed to support garments, and for like uses, and consists of two rigid bars, the lower edges of which are so curved that one may fit and interlock with the other. The upper ends of these bars are joined to a third bar at such a distance apart that by tilting in one direction, the inner or interlocking ends of the bars are separated, and when the article to be secured is inserted by straightening them out, the interlocking ends grasp the material and hold it firmly in place. A suitable suspending attachment may be connected with the third bar.

Latest Market Reports.

SAN FRANCISCO, May 9, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 50½c San Francisco, 48½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £69 4s 6d per ton.

LEAD.—New York, \$4.42½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 7s per ton=2.77½ cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 28c; 1000 lbs., 28½c; 500 lbs., 28½c; less, 29c; bar tin, \$3 lb, 32c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.00 \$ flask of 7½ lbs.; Export, \$45.00

MAGNESIUM.—New York, \$2.90 \$ lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15c.

PHOSPHORUS.—F. o. b. New York 50@60c \$ lb.

ASSAY LITHARGE.—San Francisco, 10c \$ lb, small lots.

BISMUTH.—New York, \$ lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 \$ lb lots.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, \$ lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c \$ lb.

PLATINUM.—San Francisco, crude, \$22 \$ oz.; New York, \$22 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 8c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c \$ set; 14 oz., 40s., 9½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c \$ lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c \$ lb.; soda ash, \$1.90 \$ 100 lbs. 58%; hyposulphite of soda, 2½@3c \$ lb.; blue vitriol, 5½@6½c \$ lb.; borax, concentrated, 7@8c \$ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c \$ lb.; caustic soda, in drums, 3@4c \$ lb.; Cal. s. soda, bbls., \$1.00; sks, 95c \$ 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Lined, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

(—) Indicates every other week or monthly advertisements.

ENGINEER'S LICENSE. MECHANICS, ENGINEERS,
FIREMEN, ELECTRICIANS, ETC.
40-page pamphlet containing questions asked by Examining Board of Engineers.
SENT FREE. GEORGE A. ZELLER, Publisher,
ROOM 16, 18 SOUTH FOURTH ST., ST. LOUIS, MO.

FOR SALE.**FOR SALE.**

The irons for a heavy pump bob, formerly used on 6-inch Jackhead pump, including cast bearing for elbow joint, with bolts and straps; cost \$160; will be sold for \$75 cash. Address **IRA HILL REED**, San Andreas, Cal.

FOR SALE.—1200 feet of 12-in. Steel Pipe, No. 14 gauge, in good condition.

Inquire **PORT COSTA WATER CO.**, 328 California St., San Francisco, Cal.

Valuable Hydraulic Mining Property.

located in Plumas County, Cal., containing 273 acres, title U. S. patent, water rights, ditches, etc., **FOR SALE AT A BARGAIN.** Terms easy. For further particulars, apply to **ALMARIN B. PAUL**, 27 Crocker Building, San Francisco, Cal.

TO ASSAYERS.

A fine set of assay scales with pulp balance, and set of assay ton weights, all in good order, will be sold for \$125. If applied for soon. The outfit consists of one Troemner's No. 5 balance with aluminum beam and agate bearings, mounted in glass case with sliding doors and plate glass bottom, original cost \$475; also one Becker's pulp balance No. 18, with 8-inch beam, mounted in glass case with sliding doors, costing \$26. Further particulars by addressing Box 4, San Andreas, Cal.

FOR SALE.

ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

Special Meeting.

OXFORD BETA TUNNEL AND MINING Company.—There will be a special meeting of the stockholders of the Oxford Beta Tunnel & Mining Company, to be held at the office of the company, No. 135 Geary St., Room 111, San Francisco, at the hour of 4 o'clock P. M., on the 4th day of June, 1901, for the purpose of increasing the capital stock of the company from twenty-nine hundred shares of the value of one hundred dollars each to one hundred thousand shares of the value of two dollars and fifty cents each. By order of the Board of Trustees. **W. H. KNIGHT**, Secretary.

Notice of Meeting of Stockholders.

In accordance with the by-laws of that company, the Regular Annual Meeting of the Stockholders of the **JAMISON MINING COMPANY**, for the purpose of electing Directors for the following year and transacting such other business as may properly come before it, will be held at the office of the company, rooms 54-56, No. 120 Sutter street, San Francisco, California, at 2 o'clock P. M. on **MONDAY, the 20th day of May, 1901.**

SAM W. CHEYNEY, Secretary.

THE S. H. SUPPLY CO.,

THE MACHINERY DEPOT OF THE WEST,

22d and Larimer Streets, DENVER, COLO.

During the past three months we have dismantled three mills: the Royal Gorge Mill, Canon City; the Oneida Reduction Works, Victor, Colo., and the Gold Brick Mill at Gunnison, Colo. The first of these was in actual operation less than thirty days; the second, ninety days, and the third one year. In all of these mills amalgamating machinery was used, and the consequence is that we have a great assortment of this class of machinery. For use it is as good as new in every respect. We are offering this machinery at a saving of from 50% to 75% over the cost of new machinery. We have:

14 Standard Amalgamating Pans.
78-Foot Settlers.
4 Cleanup Pans.
8 Amalgam Safes.
15 Quick Elevators.
4 Amalgam Cars.
5 Quick Tanks.
3 Retorts and Bullion Furnaces.

Two of these mills were dry crushing, containing the following roasting and drying machinery:

Howell Improved White Roasting Furnace (60x27).
3 18-Foot Revolving Ore Dryers.
1 Bruckner Roasting Furnace.
1 40-Foot Pierce Roasting Furnace.

All of these plants were fully equipped with power, including Corliss engines (18x42); tubular boilers and Heine water tube boilers; feed water heaters, and pumps.

Thousands of feet of rubber and leather belting, shafting, pulleys and hangers are in our warehouses. Write for our prices.

The air compressors we have in stock and can make immediate shipment on, are:

12½x14 Ingersoll-Sergeant.
16x14x10½ Norwalk.
12x14 Rand.
10x12 Knowles Belt Driven.
6x8 Knowles Belt Driven.

Our new catalogue is just issued and we will send you one if you ask for it. It contains a large amount of good information in regard to prices, as all of them are put in plain figures. No discounts. Send for it.

22d and Larimer Streets,

DENVER, COLORADO.

120-Stamp Mill

At Hassel, Montana,

FOR SALE.

Will be Sold as Separate Items or Entire Mill.

Erected in 1897 by the Union Iron Works of San Francisco.

Only Partially Operated for a Few Months.

Guaranteed in Splendid Condition.

WILL NAME PRICES **F. O. B. TOWNSEND, MONTANA, OR DELIVERED.**

SPECIFICATIONS (Condensed).

- 2 NO. 5 McCULLY GYRATING CRUSHERS, with steel wearing parts.
- 26 ORE BIN GATES, 20' x 24', made of $\frac{5}{8}$ " steel plates, with racks, guides, boxes, pinions, shafts and hand wheels.
- 11 UNION CHALLENGE ORE FEEDERS, 11 right and 11 left.
- 11 10-STAMP BATTERIES. Stamps weighing 1000 lbs. each, arranged to be run in mortars of 5 stamps each, driven by belt and tighteners. Mortars especially arranged and designed for inside amalgamation, and weigh with apron 6500 lbs. each. (5 batteries never used.)
- 66 COPPER PLATES, 4' x 5', weighing 5 lbs. per square foot, plated with one ounce of silver per square foot.
- 6 OVERHEAD CRAWLS, complete with Norway Iron Hooks
- 420 LINEAL FEET $\frac{1}{2}$ x 1½ TRACK.
- 6 1-TON DIFFERENTIAL CHAIN BLOCKS.
- 3 2-TON CHAIN BLOCKS FOR CRUSHERS.
- 47 UNION IMPROVED 4' VANNER CONCENTRATORS, complete in every particular. (29 never used.)
- 2 AMALGAM CLEAN-UP BARRELS, 28 x 36.
- 1 AMALGAM CLEAN-UP BARREL, 20 x 30, complete with tight and loose pulleys.
- 3 4' SWINGING BATTEAS and all fittings complete.
- 1 CAST IRON WASH TANK for clean-up work, 48 x 30 x 16.
- 1 HORIZONTAL 12" GOLD RETORT with all iron work complete.
- 1 SET OF IRON WORK FOR BULLION MELTING FURNACE.
- 2 MAIN DRIVING PULLEYS, 78 x 23½.
- 2 MAIN ROPE WHEEL, 120", grooved for eight 1½" ropes.
- 6 PULLEYS, 36 x 17.
- 1 LOT, being all necessary shafting, hangers, pulleys, belting, etc., for mill.
- 1 LARGE LOT OF PIPING, all sizes.
- 1 RAND DRILL COMPANY'S COMPRESSOR, 16 x 22, Class D, duplex (never used).
- 1 RANKIN & FRITSCH 16 x 22 CORLISS ENGINE.
- 1 HORIZONTAL RETURN TUBULAR BOILER, 75 H. P.
- 1 3-PHASE ALTERNATING CURRENT GENERATOR, 500 K. W., 60 cycle with 24 poles, type A. P., volts full load 2400, A. M. P. 120, revolutions 300, with rheostat.
- 1 ELECTRIC GENERATOR OR EXCITER, 12½ K. W. Multipolar Direct Current Exciter, type M. P., class 4-12.5-12.75, volts 125, with rheostat.
- 1 MARBLE GENERATOR SWITCHBOARD PANEL, 30" x 90" x 2", containing one general field rheostat, one exciter field rheostat, one station transformer, one potential indicator, one current indicator, one pilot lamp, one ground detector with plug and receptacle, 3 type L lighting arresters, 6 feeder fuse blocks, one double pole exciter switch, two single pole switch brake 2000-volt switches, iron angle frame.
- 3 3-PHASE INDUCTION MOTORS, type "I," class 12-150-600, form "A," H. P. 150, cycle 60, volts 2080.
- 2 3-PHASE INDUCTION MOTORS, type "I," class 8-30-900, form "A," H. P. 30, cycle 60, volts 220.
- 1 3-PHASE INDUCTION MOTOR, type "I," class 10-50-720, form "B," H. P. 50, cycle 60, volts 2080.
- 100,000 FEET NO. 2 B. & S. COPPER WIRE.
- 1 LARGE LOT OF ELECTRICAL FIXTURES AND FITTINGS.
- 2 PELTON WATER WHEELS, 350 H. P. each.

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General Arrangement of Pelatan-Clerici Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

FOR PARTICULARS, WRITE TO

THE RISDON IRON WORKS,

AGENTS.

The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

The . . . Durkee . Lightning Drill,

which represents the latest improvement in rock drilling machinery. The standard drill does the work of a 2½" air drill and requires one and one quarter horse power. Driven by electric power.

"We find we can accomplish twice as much work at the same expense as by hand drilling. Book our order for the third drill."

"We have been able to double the distance run per month over former work for the same amount of money. We are using only one horse power for the drill."

HEAT-RESISTING ROOF.

P. & B. Ready Roofing is the best roofing made; it is particularly adapted to hot climates, for heat will not affect it in the slightest and its non-insulating properties render the interior of building covered considerably cooler. Iron, tin, slate and shingles draw heat and impart it to the interior. A practical test made on a hot day showed the interior of a building roofed with P. & B. to be 86 degrees, while the interior of another building roofed with iron registered 112 degrees.

P. & B. Ready Roofing is the easiest and cheapest roofing to lay; anyone can do it. It's also cheaper to transport.

Send for booklet. Address Dept. A.

PARAFFINE PAINT CO.,

116 Battery St., San Francisco, Cal.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilean Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

LINK-BELT MACHINERY CO., Chicago, U. S. A.

POINTS OF EXCELLENCE
OF OUR NEW
JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue. Send us your inquiries.

ANOTHER M AND E SPECIALTY. NEW..... GASOLINE MINING HOIST.

All hoisting operations and engine management from one position at head of engine and facing the shaft.

THE M. & E. HOIST HAS, AMONG OTHERS, THE FOLLOWING FEATURES:

Supported Outboard Bearing.
Helical Gears.

Double-Faced Lubricated Iron Friction that will hoist 2000 lbs. with the pressure of one finger.

All speed changes made while engine is running, without operator leaving his position.

Either Post or Strap Brake
Variable speed from 100 R. P. M. to maximum of Governor Control.

WRITE FOR FULL PARTICULARS. ADDRESS

The Machinery & Electrical Co.,
351-353 N. Main St., LOS ANGELES, CAL.

THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1½ to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Wind-or.)

DOUBLE CYLINDER SINGLE DRUM HOISTS.

The above form of Hoisting Engine has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes which assures quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

Our New and Revised Catalogue of Practical and Scientific Books, 82 pages, 800; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

VALUABLE BOOKS FOR PROSPECTOR MINERS AND MINERALOGISTS.

Orton.—Underground Treasures: How and Where to Find Them. A Key for the Ready Determination of all the Useful Minerals within the United States. By James Orton, A. M., late Professor of Natural History in Yassar College, N. Y.; etc. Illustrated. . . . \$1.50

Osborn.—The Prospector's Field Book and Guide in the Search for and Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D. Author of "A Practical Manual of Minerals, Mines and Mining." Illustrated by 58 engravings. Fourth edition, revised and enlarged. 315 pages, 12mo. Price. . . . \$1.50

Osborn.—A Practical Manual of Minerals, Mines and Mining: Comprising Suggestions as to Localities and the Associations of all the Useful Minerals. Full descriptions of the Most Effective Methods of Both the Qualitative and Quantitative Analyses of Each of these Minerals and Hints upon the Various Operations of Mining, including Architecture and Construction. By Prof. H. S. Osborn, LL.D. Illustrated by 11 engravings. Second edition, revised and enlarged. 383 pages, 8vo. Price. . . . \$4.50

IN PREPARATION, ABOUT TO BE PUBLISHED:

Ernst and Brown.—Mineralogy Simplified: Easy Methods of Identifying Minerals, including Ores, by Means of the Blow-pipe, by Flame Reactions, by Humid Chemical Analysis, and by Physical Tests. By Henri Ernst, A. M., M. D., some time Chief Chemist of the United States Department of Agriculture. Third Edition, revised, re-arranged and with the addition of entirely new matter, including Tables for the Determination of Minerals by Chemical and Pyrognostic Characters, and Tables for the Determination of Minerals by Physical Characters. By Amos F. Brown, E. M., Ph.D., Assistant Professor in charge of the Department of Geology and Mineralogy in the University of Pennsylvania. 350 pages, illustrated by 98 engravings, pocket-book form, full flexible morocco, gilt edges. . . . \$2.50

The above or any of our Books sent by mail, at publication price, free of postage to any address in the world.

Illustrated circulars of the above Books, showing full Tables of Contents, will be sent free to any one who will furnish his address.

The "Stop for Repairs" to Mining Machinery,

Especially if it is a conveying plant, is a considerable item of expense. Many of these expensive pauses are made to repair or adjust faulty belting. To economize in this respect, use the

LEVIATHAN CONVEYOR BELT.

It is not only adapted to the heaviest service, but will run under any conditions in underground, dripping, extreme heat or cold.

IT WILL OUTLIVE ANY OTHER BELTING.

SMOOTH-ON IRON CEMENTS

For stopping leaks and pitting in MARINE BOILERS, for boiler patching, for repairing leaks or fractures in steam or hydraulic work, and for repairing blemishes in iron or steel castings. These cements are prepared in powdered form and applied by mixing with water. When hard they will withstand a red heat, steam, water, or oil, and expand and contract the same as iron. Write for illustrated catalogue and prices. When ordering state for what use.

Hooper 
Pneumatic
 System.

floor space, 3x6 Ft. Weight, 2250 Lbs.
Capacity, 10 to 50 Tons Daily.

WE USE NEITHER
WATER, CHEMICALS NOR QUICKSILVER.

Ores, etc., Treated:

Gold,	Copper,	Corundum,
Lead,	Chrome,	Antimony,
Zinc,	Nickel,	Cinnabar,
Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores.

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. O. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of April, 1901, an assessment (No. 22) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALEX. GRANGER, Secretary.
Office—Room 223 Crocker Building, San Francisco, California.

BUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of April, 1901, an assessment (No. 30) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of May, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.
Office—214 Pine street, room 31, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of April, 1901, an assessment (No. 14) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 25th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.
Office—773 Mission St., San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of April, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

DELINQUENT SALE NOTICE.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 10) levied on the 12th day of March, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	Shares.	Am't.
T. W. Baker.....	201	250	\$5 00
T. W. Baker.....	202	250	5 00
T. W. Baker.....	203	250	5 00
T. W. Baker.....	204	250	5 00
J. E. Krafts.....	211	250	5 00
J. E. Krafts.....	354	250	5 00

And in accordance with law, and an order from the Board of Directors, made on the 12th day of March, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 112 Main street, San Francisco, California, on WEDNESDAY, the 15th day of May, 1901, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

SOLAR HOUSE LIGHTS

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs \$4.00 Per Light

EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

Write us for particulars.

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

Leadville Conditions.

Leadville, Colo., is going through an experience which nearly every mining camp of the West has had at some time. Railroad spurs were extended to mines which had been using freight teams. Fully three-fourths of the latter have been thrown out of employment and have no longer a place in the industry of the city. The extension of the railroad tracks to the mines has possibly increased the number of men employed in the mines, has possibly increased the output by permitting lower grade ore to be mined at a profit, and may have increased the mine owners' profit.

But Leadville, the community founded on the distribution to it of part of the product of the mines, finds that part diminishing. Where it was said to be \$100,000 a month it is now said to be not more than \$40,000 a month. Therefore, Leadville has not been benefited by the change from wagon to rail tracks.

The change in the means of transportation is an advance in transportation. It is a part of progress. It has come to stay. It is an aid to centralization, which means greater economy. But—and here is the point—this progress is not Leadville's progress, for so far as Leadville is concerned, it has moved the point of "centralization" from Leadville to wherever the elusive ownership of the rails may be from day to day. Changing the center point has changed the place of distribution of the product of the mines that Leadville had.

But why should not Leadville itself be the center, as before? The center of lines of spur tracks to the mines, as before the center of wagon tracks to the mines. The spurs were built for profit, to receive for the same kind of service as had been rendered by the roads the same kind of pay—a portion of the ore product of the mines. The aggregate received by

the rail owners is at least an equal sum to that the freighters received. One more premise in this simple logic of Leadville's condition: If the sum earned by the rail spurs be distributed to the Leadville community, is not the industrial condition of Leadville at

least equal to when it had the sum distributed by the freighters?

Certainly it is. And, novel as the conclusion may seem, the logic of it is unanswerable. Leadville should itself have built and operated the rail spurs to replace the freighters. Why not, when progress required it? Rails cost large sums of money! So do wagon tracks. Ore cars cost money! So do ore carts. Engines cost money! So do mules. Certainly they may cost more money, but just as certainly they earn more money, else the men who never see them would never have built them. Why should Leadville not then have done for herself what some unknown philanthropist has done for her?

Now, to replace some of what she has lost cooperative mining is proposed. But that only means another spur track to aggravate the existing undesirable condition. Better reverse it. Let the unknown philanthropist mine and Leadville take the tickets on the spur tracks.

Other cities have found it necessary to own the roads, railroads, as well as wagon roads, that they realized in time were the arteries of their industrial life blood. Chicago had to and did. All roads can not lead to Leadville as they were once said to lead to Rome, but the roads that center naturally on Leadville can and should be made to center there. The power exists in Leadville to compel them, but it must be accompanied by the disposition to use the power and the knowledge how to. It must see the real facts if it would use the real remedy.

These words have aimed to strip the situation down to its bones. They have a wider significance than their application to Leadville or to Leadville's particular kind of condition. The conclusion is alike for Leadville and other places and other interests that confront such a condition—do the thing the other fellow does, do it first, and keep on doing it.

Old Records of Mine Operation.

A comparatively few years ago the States west of the Rocky mountains contained many abandoned mines, to which reference was then quite invariably made as unanswerable proof that mining was a failure. Later, many of these abandoned properties, on the credit of rich ore which had been mined during their early history, and a belief that cheaper and deeper mining would make them pay, were reopened. Some of them have since become such remarkably successful enterprises that the reopening of an old abandoned mine of good repute as to old ore values is regarded as a safer proposition than the exploitation of a newly discovered prospect.

Much of the difficulty incident to a decision as to the advisability of reopening has been found in the imperfect records of old operations. Maps and surveys are more or less fragmentary and incomplete, and there is rarely anything of the nature of connected descriptive writing that is sufficiently inclusive to take the place of the maps. Very often it will happen that there is nothing but the books of account and some boxes filled with the superintendent's letters.

In last week's number of this journal appeared a paper illustrating practically how the letters of a mine superintendent can be dissected and rearranged to make an intelligible and satisfactory mine history. The system has been practically applied to reducing several thousand letters written through a period of thirty years' continuous operation of a large mine. Such maps as existed were unintelligible, but the history prepared from the letters made it possible to construct maps correctly, showing all the mine workings during the thirty-year period. Very largely the stope blocks in the several levels were restored, so that both the character and value of the ore yield locally in the mine became known. It is suggested that the method illustrated can be profitably applied by the owners of old abandoned mines to assist in an expert examination of old records.

ON Wednesday, May 15, in the street intersection directly in front of the office of the MINING AND SCIENTIFIC PRESS, thousands of people witnessed the unveiling of the Donahue monumental fountain and its dedication to the mechanics of the city of San Francisco. It is a magnificent work of art in bronze. Mayor Phelan accepted the gift on behalf of the city, and Irving M. Scott of the Union Iron Works, the successor of the Donahue foundry, unveiled it and accepted it on behalf of the mechanics. President McKinley was unable to assist, as had been planned.

Miners' Association.

Colorado miners have awoken to the fact that all the industrial subordinate agencies that they pay out of the product of their mines, and, paying, provide with existence, have formed strong combinations that are practically monopolies. The objects of the combination are benevolent, so the promoters say; but their charity will undoubtedly begin in their own organization—and end there. If each of the combinations in its own line was independent of the other, the possible danger of the situation to the miners might be temporarily minimized. Each, to protect itself, would be compelled to ally itself with the mine owners as against the others. An increase in the share of any one of them from the common pot would mean a less share for some one or more of the others. The mine owner would come by his own, much as he has done in the past. The legitimate effect of the special combination would be to equalize the distribution of the total share of that particular combined industrial factor among its members, and to increase the amount available for distribution by eliminating or reducing its own wastes.

But each of the combinations is not independent of the others. They are all actuated by the community of interest principle, and, if the truth could be known, would almost certainly be found to have one common directing mind. There is, then, no balance of interest to be a protection to the mine owner. The equalization of the distribution of the respective shares becomes secondary to the increasing of the sum total by economies and reductions of wastes. Here is the location of the danger line to the mine owners. The associated combinations will act on what from their point of view is waste, and insist on a practical control of the output of the mines and on fixing the amount the mine owners shall be permitted to retain as profits. Meanwhile they will not assume any of the mine owners' risks in the mine.

A differentiating of charges by the associated service suppliers will produce the steady pressure at one or more points which will, cumulating, deprive the mass of the mine owners of the independence that comes from large profit-earning industry. From being the people who have employed men to work in the mine, who have employed other men and their transportation service to move ore or metals to points of consumption, and who have employed other men and their beneficiation service to reduce the ores and separate the valuable metal to make it available, they will become very largely the servitors of these original servants. Under nominal conditions, the efforts of mine owners are directed to the development of mines in which the ores will contain the largest possible total of valuable metal in the smallest possible tonnage. It costs no more to mine such ore than to mine any ore rock mass—if anything, it costs less. The cost of transportation of ore of concentrated value per ton is no more than the cost of transportation of worthless rock; it is simply moving a mass of matter a certain distance in a certain time. The cost of treatment of ores of concentrated value per unit of mass is no more—for the same percentage of metal content obtained—than for ores of small metal content. The effort for reduced costs of mining, of transportation, and of beneficiation, is normally to enable lower values of ore to be mined at a profit and to increase the profit margin on the higher ore values. The further this reduction of costs can extend, the more the risk of the business of mining to the mine owner is reduced.

To the associated combinations of transportation, beneficiation and trading factors, the normal tendency is to seek an increase in the quantities of ore at the expense of its quality. The flat costs to them being based on the unit of mass of ore, the more units the more profits. One hundred tons of \$10 a ton ore means much more profit to them than ten tons of \$100 ore. Naturally, then, they can be expected to favor the production of the lower grades of ore in preference to the higher. The ideal ore, from the standpoint of these associated interests, is the ore that will just pay extraction costs and transportation, treatment and trading charges, charges being inclusive of flat costs and profits.

Normally, if the quantity of metal produced, or the diminishing of consumption create an oversupply and lower sale prices, the mine owners would restrict the

production to balance the demand by leaving in the mine the ore which at the reduced sale price would not pay a profit. The hundred tons of \$10 ore would be left in the mine rather than the ten tons of \$100 ore. The associated interests in transportation and beneficiation would certainly aim to restrict production from the other end, by reducing the production of the higher ore values. This they do when they make transportation charges and treatment charges higher per unit of ore mass where the ore contains high values than where it contains low values. It is from their point view an economy. It would be waste from their point of view to permit one ton of ore to supply to consumption the same quantity of metal that two tons supplies, and the economy consists in creating conditions which make the metal in one ton of ore no more profitable to the mine owner than the same quantity in two tons of ore.

The propositions have been very broadly stated to make them clear. Reduced to its simplest form, the business contest of control of the mining industry is a contest between the mine owners alone on one side, who desire to make profit from the metal content of the ore, and the several dependent industries, allied, which desire to make profit from the handling of the raw material. The miner desires profit from production, the associated other industries from service. It is simply a difference of name, not of fact, whether the service is that of a man working in a mine or of a machine working on the ore after it is brought to the surface.

The issue the mine owner confronts is whether he or the machine he has created shall be superior. Formerly the machine was his servant, now it would act as master. Divided, the mine owners are not a match for the allied service; the latter can overcome them one by one. Allied, it may be different. Therefore it is that this paper advises the organization of the mine owners and mine workers' end generally of the industry in Colorado and elsewhere. Organization is a necessary preparation for the inevitable contest. Not in the open, yet the conflict between interests just the same exists. Just as in a business way is it legitimate for the combination of transportation, smelting, selling and manufacturing, to attempt the regulation of production and maintenance of prices of metals at the cost of the mine owners, it is equally legitimate in a business way for the mine owners to regulate production and maintain prices of metals at the cost of the machine they employ.

The interests are not common, as might seem to a superficial consideration. It is well to realize this and govern action accordingly. To this paper it would seem as if a regulation of the quantity of metal production by a natural increase or decrease of the mining of the poorest grade of ore is preferable, from the consumer's standpoint, to a regulation by decrease of the mining of the higher grades.

It may be that a logical deduction from the preceding is that the mine owners should own the smelters, the transportation and selling agencies. Why not—particularly if, as otherwise, the effect of the associated combination will be ownership of the mines by them?

ONE of the directors of the American Smelting & Refining Co. has announced that that company (probably the Metal Selling Co. was meant) will establish banks in some of the Chinese cities to handle the American production directly with the Oriental consumers. This is directly in line with the suggestion this paper made a few weeks since. Aside from the profit of the direct disposal of the American silver production, the possible banking profits from discounts and exchange are enormous. The writer knows of one branch bank that earned in profits the first year of its establishment the full amount of its capital, a quarter of a million dollars. Manchuria, if thrown open for exploration, will prove an exceedingly profitable field for the operation of the silver selling banks.

GOVERNOR HUNT of Idaho has supplemented the invitation of Secretary Mahon to the Governors of the several States to appoint the delegates to the International Mining Congress at Boise with his own invitation, and has gracefully suggested that the Governors themselves come at the head of their respective delegations. The idea is excellent, and it is to be hoped that some of the Governors will be able to accept.

Concentrates.

THE consumption of zinc in 1900 was approximately 600,000 tons, an increase of 50% over the consumption in 1890.

AMBER is produced principally in Germany. Burma, in Asia, produces a small amount. Lumps weighing as much as 1000 pounds are found occasionally.

THE strongest iron-carbon compound is steel with about 1% of carbon, and tenacity decreases with either an increase or decrease of carbon from this amount.

PORTLAND CEMENT is made from calcium carbonate and clay, the ingredients being burned and ground and then bolted to screen out everything but the impalpable powder.

IT has been determined that the lead and zinc deposits of Missouri are deposited by ascending surface waters rising from or through deep limestones which have been dolomatized.

ALCOHOL will oxidize some metals and will dissolve a small amount. Copper is not affected, but tin, lead and galvanized iron in time become more or less oxidized. Lead enters into solution also.

IT has been noted that coal outcrops under the point of long, narrow ridges are thinner and of poorer quality than the same seam where exposed in the valley or ravine depression between the points.

NO PREMIUM has been offered to any one who invents a machine to scour the gold in the beach sands at Gold Bluff in California. But the beach is there, and the inventor can take it and work out a premium.

FRICTION is independent of the extent of the surfaces in contact, it is practically independent of the velocity when there is sliding motion and it varies with the pressure when the materials of the surfaces remain the same.

GERMANY is an exceedingly large consumer of copper and a comparatively small producer; in 1890 the consumption was 106,700 tons and production 31,930 tons—the latter a decrease of 5726 tons from the preceding year.

LIQUID air as an explosive has been tested. Prepared somewhat as dynamite is, by saturating an absorbent, its explosive effect is about the same as dynamite, but volatilization is so rapid when exposed to the air that the use of it is not practical.

SOMEWHERE between 2% and 3% of carbon in iron and an increase changes the description to be applied to it from steel to white cast iron. Steel and white cast iron in composition make an unbroken series from the softest steel, with .06% of carbon, to the hardest of white iron, with 4% or more of carbon.

BORT, the black diamond used in drills, is only found in Brazil. They are found with the gem diamonds in the gravels in the beds of streams and some are mined from land deposits (probably old stream beds) by tunnels. The supply is small, the native methods being crude and costly. The demand maintains prices.

CARBON exists in steel in two forms, graphite and cementite. The latter is a carbide of iron, Fe_3C , containing 6.57% of carbon. It is extremely brittle, harder than glass or hardened steel. It is the carbon of the cementite which is the combined carbon in the steel; the graphite exists in it as a mechanical ingredient, retaining its individuality.

THE solar spectrum is not the short rainbow color band so well known but extends far beyond its limits. A small part of this elongation has been known for a long time, the ultra-red as heat rays and the ultra-violet as chemical rays. In both directions the spectrum is now known to extend far beyond these limits and it is not known if the limit is reached yet.

THE method of working the frozen claims in the Yukon valley is by steam thawers. A small boiler is generally used, from which the steam is passed through rubber hose, to the ends of which pointed steel tubes about 4 feet in length are affixed. The latter are driven into the frozen gravel and steam is forced through them for six or eight hours. They are then withdrawn and the thawed material removed.

FERRIC SULPHATE [$\text{Fe}_2(\text{SO}_4)_3$] and ferric chloride [FeCl_3] will dissolve sulphide ores. Tests made with the latter showed that calcocite would dissolve readily, bornite somewhat slower, pyrrhotite, chalcopyrite and pyrite in the order given, the latter, however, very slowly. A hot solution of ferric sulphate will dissolve chalcopyrite readily. The weathering of pyrite produces ferric sulphate, so that under natural conditions the solution can occur.

THE United States Consul General at Apia, Samoa, reports officially that he made investigations and has been unable to find any person having any knowledge of the existence of gold, silver, mica, nickel, tin or any other metal in Samoa. He says no persons named as constituting the Gold Mining Co. are in Samoa, that no vessels of any kind are engaged in transporting sands or ores to Sydney or anywhere else; in short, that all representations of gold or metal mining there are a swindle and a fraud.

IN British Columbia a miners' inch of water is still an indefinite quantity. It is described as the amount that will pass through an orifice $\frac{1}{2}$ inch wide, 2 inches high, 2 inches thick, with 7 inches above the top of the orifice, and every additional inch shall mean as much as shall pass through the orifice extended horizontally $\frac{1}{2}$ inch. It

has been suggested that the definition be changed and made the same as now designated by law in several of the Western States.

WHEN a mine has become forfeit by reason of failure to do assessment work annually, all the improvements are forfeited with it, and the mining claim being relocated, the claimants have the right to the improvements. A mill would be an improvement that would become forfeit. If the mill which had been used in connection with the mine was built on a separate millsite location it would not become forfeit by failure to do assessment work on the mine, and could not be located or claimed with the mine. The mill on a millsite claim is the property of the builders till it is abandoned. The payment of taxes is evidence that it is not abandoned.

THE most contradictory reports continue to come of mines or possible mines in the Philippines. They can with some reservations be boiled down to this: Working prospectors who have got out into the mineral bearing country, and who have themselves tested the ground, bring generally favorable reports as to extent of the mining area and its value. Those who have merely prospected Manila and the local sources of information make unfavorable reports. Against the latter it may be noted that the so-called sources of information are more exactly sources of misinformation, and natives of the far east generally possess a disposition to tell the questioner just what they think the questioner would like to be told.

IN a four-cycle gas engine it takes four strokes or two complete revolutions before it repeats. First the piston moves out and draws in its charge of mixed gas and air at atmospheric pressure. On the return stroke it compresses the charge in the clearance space. Then ignited the pressure and temperature suddenly rise and the piston moves out as the burning gases expand. On the return stroke the exhaust valve opens and discharges the burned gases. In the two-cycle engine the air and gas mixture is first compressed and made to drive out the waste of the previous explosion while the piston is out at its dead center. The waste valve closing the mixture is then again compressed and exploded at the end of the in-stroke, thus repeating with every revolution.

LIEU LANDS are lands which may be taken in exchange for, or which are taken in exchange for, other lands to which for specified reasons the U. S. Government finds it desirable to regain its title after a private claim has attached by operation of law. In some cases a designated reservation has been made to provide lieu lands for possible exchangers who have land the Government wants. This land—reserved to become "lieu" land—can only be agricultural land. Mining claims are located on it. It does not become "lieu" land till taken by some claimant in exchange. Until title is confirmed it is locatable if a mine be discovered on it. Generally one having the right to "lieu" land is granted the right to select it anywhere in the public domain not otherwise claimed or occupied. The selected land then becomes "lieu" land. It is subject to location if a discovery of mineral of value be made on it. The mere selection in exchange would not protect the exchanger in the ownership of a tract of land to which he could not get agricultural patent directly under the homestead laws.

THE increased development of water power involving the construction of costly pipe lines has made the methods of preservation employed of importance. The rule of thumb method is to dip the pipe in some approved bituminous preparation, coating inside and outside, and letting it go at that. A better way is to begin with the planning of the pipe. This should be given a diameter such that the velocity of flow of the water through it should be low—3 feet a second is a reasonable maximum. The object of this is to reduce the wear on the interior covering of the pipe. Incidentally, it increases the effective working head by reducing the head consumed by friction. The pipe should be provided with a number of conveniently disposed manholes and should be of sufficiently large diameter to admit a workman to recoat it from time to time. Practically complete protection against corrosion can be given to the inside of the pipe. The possible deterioration is thus limited to the outside. Where the pipe is buried a renewal of the outside coating is impracticable, though possible. Bituminous coating is not costly, and the preferable method of protection would seem to be to make the outside coating thick and specially resistant in the first instance. After giving to the pipe the dip coating inside and outside, the outside could be subjected to a second coating, increasing the thickness. This could be effected by taking the pipe after the dip had cooled and hardened, closing the ends with temporary shields, and then turning it on the surface of a kettle of dip so as to receive a sort of shell wrapping of the dip, giving it an additional thickness. With the greater thickness of dip there should be more care in handling it into place in order to preserve the coating against being broken.

SORTING ore that is to go to a wet-crushing stamp mill is practically a question of comparison of costs, in which are included comparison of ultimate losses. The latter may be the more important factor. Milling costs with large mills are so low that it is apt to cost less to crush one ton of waste rock than to handle two tons from which half is sorted out and discarded. The discarded part, however, carries some value, and the final tails contain some unrecoverable values. By not sorting, this final loss is apt to be increased in the aggregate over the sum of the metal value in the sorted out waste

and in the final tails from the limited milling. The sum of this extra loss and the extra milling cost is then to be compared with the direct cost of the sorting. If the tails from the stamp mill are subsequently to be treated by cyanide or other lixiviation process, there remain to be added to the extra loss and extra direct milling cost, the cost of handling the portion that would be sorted through the cyanide process, including the loss of chemical which is always directly as the quantity of ore treated. It is clear that where there is treatment after passing the stamp mill the costs of treatment of waste may cumulate to a point that will make hand sorting economically desirable. Where crushing is only followed by concentration the comparison of costs and losses would probably show the balance on the other side. The choice is one of the practical problems that come up when the question of a scheme of treatment for the product of a mine must be decided. It is not answered by the bare statement that the crushing is cheaper than the sorting. The practice in the Transvaal of sorting the ore coming out of the stopes and rejecting a considerable fraction that contains over a dollar a ton is based on the ultimate costs as determined by the line of consideration suggested.

THE formation of conglomerates is generally explained by the statement that they are sea beach deposits. The explanation is simpler than the phenomenon. A bed of conglomerate, or several beds, will be found sandwiched between layers of sandstone from a few inches to several hundreds of feet thick. The sea beach is the cutting edge of the sea. It undermines land surface but does not dig down into depths beneath the sea surface. Ocean currents wearing against solid rock do not tear off fragments. At the most they may wear some rock surfaces by moving sharp edged sand. The cut and rolling force of the waves may explain the formation of the cobbles, rounded pebbles and rock fragments which compose the conglomerate but they do not explain the enormous areal extent and thickness of the deposits nor do they explain the sorting out and bedding of the material. It is suggested that the origin of these beds is not so much the cutting edge of the sea at its margin as it is the erosion of the land waters—the erosion of the rivers and all their branches. There is no question but that the areas of rock surface exposed to such action are many times the extent exposed to sea cutting. And there is no question about the transportation, the spreading areally and enormous accumulation in depth that is done by the land waters. The phenomenon of sorting and stratification is readily comprehensible with stream-born deposits. There are no such limitations of current intensity with stream waters as exist with sea currents. In torrential activity a stream moves along its bottom grinding and rounding both the small grains of sand and the large rock masses. With the cessation of this intense activity the mass of solid matter stops unsorted. The mass may appear to the eye to be entirely composed of sand. Test it by screening and it will be found to contain an appreciable quantity of rock fragments, gravel and even cobbles. More or less gentle stream currents, relatively to the torrential activity in the intervals between the periods of the latter, naturally perform the screening. The lighter and smaller sand and silt grains are picked up and rolled on down stream, the heavier and larger gravel stones and rock fragments becoming successively undermined become lowered in place and accumulated until ultimately their mass forms a protecting cover against further undercutting and removal of the sand, the stream makes its temporary bed and base plane of cutting on these accumulated gravels. This rearrangement is accompanied with alteration of grades, in turn altering velocities and reducing or increasing the transporting power. It may happen that the sands and silts sorted out upstream may be deposited in mass on top of the gravels overlying the still unsorted mass of sand and gravel which to the eye would seem exclusively sand. In this stage a period of torrential activity cutting partially through the area of the successive accumulations, and entirely through their depth again moves sand and gravel alike onward down stream. The face of the cut in the bank shows underneath what appears to be a sand bed but is, as explained, not necessarily one, next a seam of gravel or rock fragments and finally a sand bed. All these are unconsolidated but the structure is identical with the alteration of sandstone and conglomerate beds described. The presence of marine shells in the sandstone beds is explainable. The illustration given is of the method not the place of formation. Regional subsidence and uplift have brought the land formed unsorted and unconsolidated masses beneath the sea surface and sea currents have made the sorting and layering of the gravels and sands. Alternations of uplift and subsidence, the latter predominating, would create the alternations of beds observed in the rocks. Depth and pressure would form the rocks from the unconsolidated beds. Examining in detail a conglomerate bed it will be noted that while the largest gravel stones have no rule of distribution the heavier of the finer particles are invariably concentrated at the bottom. This is noticeable as an economic factor in the so-called reefs in the Rand, South Africa. The gold is not uniformly distributed through the mass of the blanket but is concentrated in the bottom so that only the bottom 30 inches or thereabout are removed and mined. The formation of the auriferous black sand beds is in the manner described, and it is the mode of formation of the Transvaal gold-bearing blanket as well. The latter has been through one more stage of rock history metamorphism.

The Original Source of the Heavy Metals of Ore Deposits.*

By PROF. J. H. L. VOGT, University of Kristiania, Norway.

It is well known that many investigators, even in most recent years, have sought to derive the heavy metals of ore deposits from the inaccessible interior of the earth. This hypothesis was favored by the remarkably high specific gravity (about 5.6) of the whole globe, which was explained by assuming that the heavy metals were concentrated in its interior. A further confirmation was sought in the quantity of iron found in meteorites, and also (by spectral analysis) in the sun. The earth's interior was regarded as a liquid molten mass, and the products of volcanic eruption as furnishing samples of this mass, bringing with them, from the richly metalliferous hearth of interior fusion to the upper horizons, or even to the surface, small quantities of metals and metallic compounds. In support of this hypothesis, the beautiful synthetic production, by sublimation, of cassiterite, specular iron, etc., performed by Daubree and other French experimenters in the middle of the nineteenth century, and received with universal and significant interest, has often been cited.

The hypothesis is seductively simple, but cannot be maintained. We must accept as now proved, that the interior of the earth cannot be regarded as a liquid molten mass. In the words of the distinguished Swedish physicist, Svante Arrhenius,

Modern investigations of astronomers and physicists show that the deformations of the earth's mass under the influence of the moon and sun (tides of the earth's crust), and the variations of the earth's axis (called precession and mutation) due to the same outside causes, present such a quantitative order as to be irreconcilable with the assumption of a liquid interior.

He concludes that the crust of the earth is solid to the depth of about 40 kilometers. At the temperature of about 1200° C., and the pressure of about 10,840 atmospheres, existing at this depth, most of the ordinary minerals are fused, and dissolve the less fusible materials. That is to say, at the depth of about 40 kilom. begins a liquid molten condition, which, however, cannot continue to much greater depth. For at about 300 kilom. the temperature must without doubt exceed the critical temperature of all known substances; and at this point the liquid magma passes gradually to a gaseous magma, subject to extremely high pressure. The viscosity and lack of compressibility of this gaseous magma may be greater than those of the liquid magma.

We must give up, therefore, the old conceptions of the earth's interior condition. There is no reason for supposing that the heavy metals of ore deposits have come from the enormously compressed earth interior—which, as some physicists declare, must be, in consequence of such compression, "as hard as steel." In fact, no connection has ever been shown between ore deposits and this heavy interior mass.

We are forced, then, to the conclusion that ore deposits are derived from the crust of the earth—this crust, however, being regarded as not 1 or 2, but 10, 25 or even 50 kilometers thick. Indeed, as will be shown below, a notable number of ore deposits may be referred to eruptive processes connected, not with the heavy interior, but with the crust, of the earth. Many deposits, as Van Hise has recently shown, are due to the action of ground water.

Moreover, it has been shown within recent decades that many elements, formerly regarded as very rare—often as totally absent—in rocks, are in fact almost invariably present in detectable (though, of course, generally minute) quantity. On this point I may mention the investigations of the American chemists, F. W. Clarke and W. F. Hillebrand, and also my own paper on the relative distribution of the elements, etc., from which I here introduce a brief passage.

DISTRIBUTION OF ELEMENTARY SUBSTANCES IN THE EARTH'S CRUST.—Of the entire earth crust—namely, the rocks, sea and atmosphere—oxygen constitutes by weight about one-half, and silicon about one-quarter; the proportions of aluminum, iron, calcium, magnesium, sodium and potassium range from 10% down to 1%; those of hydrogen, titanium, carbon and chlorine from 1% to 0.1%; those of some eight elements, phosphorus, manganese, sulphur, barium, fluorine, nitrogen, pretty certainly also zirconium and chlorine (but probably no others, with the possible exception of strontium), from 0.1% to 0.01%. Between 0.01% and 0.001% come nickel, strontium (?), lithium, vanadium, bromine, and pretty certainly also beryllium and boron, but probably not tin, cerium and yttrium, or other elements. Between 0.001% and 0.0001% are cobalt, argon, iodine, rubidium, pretty certainly tin, cerium and yttrium, and possibly also arsenic and lanthanum, but probably no others. In summary, therefore, we have:

TERRESTRIAL DISTRIBUTION OF GROUPS OF ELEMENTS.

Percentage.	No. of Elements.
10 to 1.....	6
1 " 0.1.....	4
0.1 " 0.01.....	8
0.01 " 0.001.....	7
0.001 " 0.0001.....	7

Similar figures are obtained for the intervals 50% to 5%, 5% to 0.5%, 0.5% to 0.05%, etc., proving that

* Extract from paper Trans. Am. In. M. E., Feb., 1901.

there is a law of quantitative distribution of the thirty-four most widely occurring elements, according to which some four to eight elements fall within each decimally reduced interval. From this law we may with some confidence further infer that of the total of, say, thirty-seven known elements, some would fall within the next following smaller intervals, for instance, between 0.0001 and 0.00001%, or between the latter and 0.000001%.

It may here be noted that all the more widely distributed elements (O, Si, Al, Fe, Ca, Mg, Na, K, H, Ti, C, Cl, P, etc.) have relatively small atomic weights. The twenty-five elements having the lowest atomic weights (up to and including iron) constitute at least 99.8% (more probably 99.85% to 99.9%) of the earth's crust, while the remaining (say) forty-six elements (among which barium, strontium, nickel, etc., are the most widely distributed) make up a total of 0.1%, or at most 0.2%. This is a result, on one hand, of the laws which controlled the formation of the elements themselves, which are probably to be conceived not as original and simple substances, but as compounds; on the other hand, of those which controlled the formation of the earth crust from the original fire-mist of Kant and Laplace.

The elements of highest atomic weight are, then, on the whole, relatively the rarest in rocks; but that they do exist therein, though in minute proportions, and doubtless in some rocks as original constituents,

platinum metals has been found (as at Sudbury, Can., and Klefva, Sweden) in the segregated sulphide ores of gabbro rocks—a fact which requires the supposition that that the gabbro magma originally contained them. Some conception of this original tenor of platinum metals may be formed from the statement that the nickeliferous pyrrhotites of Sudbury contain, according to many analyses, from 25,000 to 90,000 times as much nickel as platinum metals; while the original proportion of nickel in the gabbro magma may be set down as about 0.05%. Hence, on the (somewhat arbitrary) assumption that the platinum metals were concentrated from the magma to the same extent as the nickel, the magma contained, roughly, 0.000001% of these metals. This figure, of course, has no pretension to accuracy; but we have at least learned that the platinum metals are among the normal constituents of the basic eruptive rocks.

It can be similarly shown that minute quantities of gold and silver belong in eruptive magmas. For further discussion of this subject, and of the relative concentration of certain elements into the acid, and of others into the basic eruptives, I refer to my treatise cited above.

Alaska Transportation in Winter.

Two illustrations on this page illustrate the novel transportation facilities of Alaska. The dog team

A Reindeer Sleigh Ride at Nome, Alaska.

Hauling a Boiler by Dog Team at Atlin, B. C.

may be shown, by way of illustration, for the platinum metals.

These metals are found here and there—often together with segregations formed by magmatic concentration, in very basic eruptive rocks (peridotite, and, as reported in only one locality, highly basic olivin-gabbro)—a fact which clearly indicates their original presence in minute proportion in these rocks. Moreover, in recent years a small proportion of

shown sledding a boiler to a placer claim is too common a sight to be a novelty either at Atlin, where the view was taken, or in the Klondike. The sleigh ride behind the reindeer at Nome is new in Alaska. Except at Cape Nome and Port Clarence, the experiment of introducing reindeer has so far been a failure, and it is only this winter just past which has afforded much opportunity for their use at these places.

Tonopah.*

Written for the MINING AND SCIENTIFIC PRESS by S. A. KNAPP.

The new mining district, Tonopah, literally "water brush" in Shoshone, which is now attracting so much attention on account of the richness of its ores and the considerable amount being shipped, is situated near the line between Esmeralda and Nye counties in Nevada, which county can claim it not being as yet positively determined. It is about 60 miles south of east from Sodaville, Nevada (whence two stage lines run), about the same distance east of Candalaria, about 40 miles east of north from Silver Peak, about 50 miles south of Belmont, and is situated at an elevation of about 6000 feet, in the low foothills, on the western slope of the southern end of the San Antonio range of mountains, where they break in long, easy slopes down to the San Antonio desert. The San Antonio range of mountains is in this locality broken up into a series of isolated buttes and short, sawtooth ranges, and show many evidences of extensive volcanic action and great chemical activity.

The ledges were first discovered by J. L. Butler of Belmont in June, 1900, and so unpromising was the appearance of the ledges and ore that tests and locations were not made until in August, 1900. When assays were made, to the surprise of all it was shown that this unpromising looking hard quartz, with just a black streak of stain now and then, ran from 300 to 500 ounces silver and from \$60 to \$100 gold per ton.

Mr. Butler secured five claims, covering the out-crow showing, and perfected the same. The fact that rich ore had been found became known among the miners at Silver Peak and Southern Klondyke, and about November 1 a few went in and took leases. The assays obtained when work on ledges commenced ran so high that the news spread rapidly, and by January 1, 1900, about eighty men were at work, and since then the number has increased to 150, there being thirty-six different leases in operation, working two to ten men on each one, and the outside men bring the number in camp at this time up to about 225.

The ledges, of which there are eight now known, each outcropping for 800 to 1000 feet in length, vary

a few other locations, which has apparently been exposed by denudation, the original formation—porphyry enclosing the ore-bearing veins—appears to have been covered by two later porphyry flows, the first being a flow of rhyolite, the second a blue porphyry, which in a number of places is found covering the rhyolite, the exposures in various places showing this condition, and there is considerable reason to suppose that prospecting and opening the ground will show that the area containing these rich ledges is more extensive than at first supposed. Water is in limited supply, a small spring supplying the needs of the camp. A well 40 feet deep struck good water in the desert 15 miles west of the camp. At Desert Wells, 20 miles distant, considerable water can be developed.

Wood is scarce, it being 16 miles to the nearest supply of any consequence. The Columbus coal mines are 35 miles distant and may prove an important factor.

Notwithstanding these unfavorable conditions, the extent and high value of the ores will undoubtedly result in overcoming the same and the establishment of an important and profitable industry.

Hawthorne, Nev., April 25.

Minerals of the Philippines.

TO THE EDITOR:—Prospectors have been coming to the islands from other countries as long ago as forty years. The principal gold mines were found in the provinces of Camarines Norte, and considerable metal was taken out. In recent years gold has been found in Mindanao and at the present time there are several mines operating there, some having modern machinery. The grasshopper eaters of Mindanao have for a long time been coming into the cities and towns with little nuggets of gold, which they traded for articles of food, wear and general supplies. The mountain tribes of Cimeras and Negros have also found gold in places and have managed to market some of it. The natives are very close about revealing the whereabouts of the mines, for they appreciate the value of a mine, even though they allow themselves to be cheated greatly when selling the product to others. Gold has been taken out in paying quantities at Tagsulip, Cuena, Misamis and on Panay the soldiers have found gold in the mountains in the interior.

There will be little done, however, in gold mining until quartz crushing machinery is put in. The natives, Spaniards and Chinese have taken and worked much of the surface or placer mines. There is, however, an opportunity for quartz mining, and lodes

can be secured in many sections of the archipelago containing paying quantities of gold. Quartz veins have been located in Mindanao, Luzon, Panay, Negros and Cebu. For a time the Spanish government kept records of all mining enterprises and a large royalty of the gold mined had to be turned over to the king of Spain.

The former famous Mambulo mines produced at one time about 3000 ounces of gold monthly, the market price of which was about \$20 an ounce. These old mines were worked by the natives long before the Spaniards came. Ultimately they passed into the hands of an English syndicate. The English failed to secure profitable returns from their investment. They employed the wrong kind of labor. The Spaniards, knowing the people of the islands, employed Chinese to operate the mines and made money. The English discharged the Chinese and put in natives, who would work a few weeks and quit until they spent the money earned. The native labor can be hired for 10 or 15 cents per day for mining work, but will not work steadily. The Chinese can be secured at practically the same rates and there are thousands of them available, but many foreign firms will not hire them. The writer has seen mines in which the labor is all Chinese, with Chinese foremen and white superintendents, and these mines are paying, while mines in which the labor is all Filipino are usually the reverse. The individual native miners depend upon finding pieces of the precious metal in the crevices in the mountains, and often months are devoted to a search which will result in the finding of a small piece of gold. One cannot remain in any portion of the islands long without hearing mining stories from natives and soldiers concerning the existence of placer deposits, and of streams the beds of which contain fine grains of gold. The sands of these streams when washed show color, oftentimes in paying quantities. Your correspondent has witnessed the washing of stream sands and on several occasions beach sand, with the result that payable gold deposits have been located.

COPPER.—For years it has been known that copper mines existed here. The writer has seen old Spanish mining records in Iloilo and in Manila referring to them. The copper mines located in the northern portion of the island of Luzon were worked by the natives 100 years ago. Since then they have been operated at intervals by natives, Chinese and foreigners. Many of the old mining operations failed to

secure returns on investment, due to causes which do not now exist, so that some of these mines are at the present time in successful operation. They have a peculiar way of getting the copper deposits from the rock in some of these native mines. The Filipinos locate the veins containing the ore and then proceed to build wood fires on it, keeping the fires going until the heat softens the rock and permits the easy removal of the ore. They make crude smelting furnaces on the ground, of stone, small in size but effective. They get the necessary draft by using bamboo blowers. Copper has also been found in paying quantities in several of the principal islands of the southern portion of the archipelago. The Visayan group is already turning out some copper, mined by Americans and others, who expect some time to have mining machinery of modern type in operation, some having been ordered from the United States and Europe. Some of the newcomers desulphurize the copper ores by "heat roasting," or by putting them through reverberatory furnaces constructed in the shops of Iloilo. In the treatment the ore is crushed and rolled till very fine, and is put into furnaces. The product is a copper matte.

SILVER MINES.—A number of Australians and some capitalists from Montana have been in the islands prospecting for silver for several months. They have located what they claim to be paying claims on the island of Mindanao and are selling stock in Manila. It is stated that these new mining concerns will operate on a large scale. They propose to have the roads put into such shape that ore can be moved as desired. At present mining is seriously hindered owing to bad roads and lack of machinery.

COAL.—There has been a great need of coal in the Philippines for many years, the supply being foreign, except small quantities of poor quality from mines of moderate size which have been operated on the islands of the southern portion of the Philippine group. These coals are not suitable for steamship use. They are, however, available for use in the sugar refinery plants, oil works, artificial ice making apparatus, stoves, etc. Until recent years the native woods have been used, but many cooking ranges have been brought to the islands lately, and a large number of boilers and engines for wood working machinery. These require coal, except where the furnaces are specially fitted for wood burning. The result has been that there is an active demand for the coals of the local mines and the coal miners are making money. The cost of coal which is shipped here from other countries is very high, so that the native coals, which sell for about \$2 gold per ton, have the market. The writer saw several mines in operation in which the coal was suitable for use, while in other cases the coal appeared to be more like clay than a heat producing substance. This clay-like coal burns, however, but it cannot be stoked or raked in the furnaces. It must be put into the furnace in one large lot and permitted to become ignited from the center, soon becoming fiercely hot. This coal is sold in sacks, being taken from the mines in sections where roads will not permit of wheeled vehicle traffic, so that the sacks of coal are brought to the markets on pack animals.

IRON MINES.—The Americans are not at all slow about locating the possibilities for mining in the Philippines, and several months ago a mining bureau was established in Manila in charge of United States army officers, who give all of their time and attention to promoting the systematic geological searches for iron and the precious metals. In this mining bureau one may see immense charts, on which are marked the locations of different claims, and as far as possible the proper owners have their names recorded. Where claims are in dispute the officials try to arrange a straightening out of the conflict. Old Spanish land grants are taken into consideration and everything possible done to further the interests of the proper owners of the mines and lands. The owners are numerous in some cases and the officers have had some difficult problems to decide. As to the iron mines of the archipelago, one official informed me that they had located an exceedingly rich iron mountain in the southwestern portion of Luzon, and expected to put in the proper outfit of machinery for working it as soon as it can be secured. The ores obtained from the iron mines in the vicinity of Angat, in the Bulacan district, are of superior quality. Specimens containing as much as 60% have been taken from the iron mines of Cebu. The Spaniards seem never to have taken much interest in the iron mines, and there is hardly a foundry in the Philippine group that is using iron of native product.

There are several good-sized foundries in each of the larger cities, such as Manila, Iloilo, etc., while in the several hundred smaller cities and towns I noticed that they had one or two iron or other metal working shops in operation. The natives are good workers of metals and are able to shape plows and all sorts of devices from the iron bars.

MAPS A GREAT HELP.—Parties proposing to engage in mining in the Philippines should first go to the mining bureau and look over the large array of maps of the different mining territories. One should not engage in mining in the Philippines without doing this, because he would otherwise surely get into trouble with original owners. Prospectors often locate a claim in the wilds of the jungle, where they

Sketch of Rock Formations, Tonopah, Nev.

from 1 foot to 5 feet in width, and in a few places are even larger, the average being about 2 feet, and run generally parallel, the course being northeasterly and southwesterly, and, with a few local modifications, dip nearly vertical. The walls of the veins are generally smooth and good, although occasionally there is no salvage. But little faulting is evident, and then only with small throw. The ore is a hard, compact, close-grained quartz, carrying gold and silver, the mineral occurring in streaks and ribbons throughout the vein material, the silver occurring as a remarkably pure silver sulphide—no zinc or lead—except in a few places where chlorides show, mostly as horn silver, and evidently a local enrichment due to leaching from broken and shattered portions of the veins. The gold is largely metallic, although in some portions there is reason to believe tellurides are present.

The proportion of gold and silver is generally one ounce gold to 100 ounces silver.

In some portions of the ledges black oxide of manganese and iron replace the silver minerals, and, owing to the similarity in appearance when so intimately mixed in the gangue, render it difficult to assort the ore closely. A careful sampling of this entire outcrop and series of ledges, so far as opened, shows the mass to average a little over 100 ounces silver and about \$20 gold per ton.

The assorted ores shipped by leasers run up to 400 and 500 ounces silver and \$100 gold, and samples taken run several thousand ounces silver and proportionately in gold. The high cost of shipment and reduction—\$43 per ton, 90% returns—precludes the handling of any ores much less than 100 ounces silver and \$20 gold per ton, and the second class ore now being piled on dumps by leasers shows averages of 50 to 80 ounces silver and \$12 to \$15 gold per ton. This is awaiting the advent of local reduction works.

The work thus far has mostly been done by leasers, 100 feet along the ledge being the usual form of allotment, and as the topography of the country does not admit of much tunneling the work has been done in open cuts and small shafts, several of which are down 50 to 55 feet.

The formation enclosing the ledges is porphyry, and in proximity thereto is seamed and fissured considerably, and in many instances carries considerable value.

Outside the area covered by the Butler claims and

*See illustrations on front page.

suppose that they are the first to tread, and are surprised later on to have some previous owner step in and present his claims. The original owner cares nothing for his neglected property until he sees Americans or others getting rich ores from the lands, and then he comes out of his hiding place and asks for a division of profits.

OILS.—Recently there has been considerable prospecting for petroleum. The new San Isidro plant on Luzon is doing an immense amount of business with its limited facilities and is obliged to keep its plant in operation twenty-four hours—day and night. Oils for illuminating purposes are very scarce and costly. The kerosene oils of the islands sell usually in small cans or bottles and at ridiculously high values. Some of the soldiers in the interior of Panay lately discovered oil wells and are planning to operate these wells when they get mustered out of the United States service. They have bought up the lands at very low rates and will use their muster out money, amounting to several hundred dollars, in providing an outfit. Recent orders to the effect that houses must have a front light at night has called for an increased consumption of oils, and the demand and price have both increased.

PHILIPPINES.

Manila, P. I., March 28.

The Kellogg Tunnel—Bunker Hill & Sullivan Mines, Idaho.*

The tunnel known as the Kellogg tunnel is situated at Kellogg, Shoshone county, Idaho, and is being driven by the Bunker Hill & Sullivan M. & C. Co., for the purpose of developing a group of mines worked by them, and known as the Bunker Hill & Sullivan mines.

The mines up to the present time have been worked through tunnels upon the property; but as the ore on these levels and above is fast becoming exhausted, the necessity of hoisting and pumping, or driving a

were brought to be loaded. A section of the hoist frame and mucker frame is shown in the cut. Sufficient powder is used to break the rock, which is a quartzite, to a suitable size to be handled by the scraper.

Five men are employed at the removal of waste—one to operate the hoist, one to attend the dump cars, placing and removing, and three loading and attending the scraper. The time required to move 40 to 50 cubic yards of waste is two to two and one-half hours.

When it becomes necessary to advance the incline floor, or mucker, a car underneath the frame carrying four jackscrews, made from worn-out machine-drill feed screws, is used. The framework is jacked up until the entire weight is upon the car. The frame is then pushed back to allow the placing of new track. When the new rails are laid, the frame is advanced nearer the face of the tunnel, lowered to the floor, and is again ready for use. To move the hoist, a framework mounted upon a car truck is run under it, and four jackscrews, made from worn-out machine feed screws, are used to jack the entire hoist and frame from the floor, when it is ready to move forward. The time consumed in moving both hoist and mucker will not exceed twenty minutes for the five men. These frames stand the work well. Both the present hoist frame and the mucker have been in use for fifteen months and have been used to drive 3400 feet of tunnel. Both appear to be in fair condition.

The drills used are the No. 4-A Rand air drills. Two machines are used at a time, both working upon the same bar. They are driven by compressed air at ninety pounds pressure, supplied through a 4-inch pipe from the air compressor supplying the mine. In untimbered ground a heading is driven 10 to 20 feet in advance, three rounds being shot in the heading to two in the bench.

All material and waste is handled to and from the tunnel by a General Electric motor, of four tons weight, running upon a track of 24-inch gauge. This motor hauls a train of fifteen loaded cars on an

with the mine, ore will be hauled to the mill by electric motors. From 800 to 1000 tons will be handled through the tunnel daily to supply the concentrator.

"Paragon" Gas Engine Lubricator.

The improved form of gas engine lubricator shown in the cut, which has been designed by the manufac-

turer, the Lunkenheimer Co. of Cincinnati, Ohio, under the trade name "Paragon," is claimed by them to adequately fulfill the requirements of the service for which it has been designed. Its construction has been improved and all objectionable features have been eliminated.

The filling arrangement consists of a screw-down

The Kellogg Tunnel, Bunker Hill & Sullivan Mines, Kellogg, Idaho.

tunnel at some lower level, became apparent. The mill of the company is situated some 9000 feet from the mines, at an elevation of 800 feet below the lowest working level, the ore being conveyed to the mill by a Bleichert aerial tramway. It was therefore decided to drive a tunnel from the mill to the mine, thereby furnishing an outlet for the ore and drainage for the water, besides giving some 750 feet of stoping ground.

From the very outset the aim has been to make the greatest possible progress. The first difficulty encountered was the removal of waste material after blasting. Shoveling by the day and under contract was tried with but little difference in results. A single drum, double cylinder hoisting engine was installed, mounted upon a wooden frame, so that loaded cars holding 1 cubic yard of waste could pass under. A second wooden frame, with incline floor, was used just in front of the hoist. This frame was so arranged that two of the dump cars could be pushed under the end of it at the same time. A No. 1 scraper, or slusher, loaded with muck or waste, was hauled up this incline floor by the hoist to an opening in the frame over the car, when the scraper load was dumped into the car and the scraper returned for another load. Two scraper loads usually filled a 1-yard car, and never more than three were required. When the first car was loaded, it was pulled forward and the second car brought under the loading opening. When both cars were loaded, they were together pushed to a position on the track some 50 to 100 feet below, where the trains were made up, and two more empty cars from the siding

average, though as much as twenty cars are sometimes handled. The tunnel has a grade of 0.5% for the first half and 0.3% for the remainder. Rails of thirty pounds to the yard are being used. The track is single aside from the 200 feet of siding near the face, which is moved from time to time as the tunnel advances.

The smoke and gases are removed through a 22-inch galvanized iron pipe, made of No. 18 iron, by an exhaust fan. This fan, in fifteen or twenty minutes, will remove all smoke and gas after blasting to enable the men to return to work; and though the pipe is now over 8000 feet long, the time required to remove the smoke seems no longer than at first. This pipe is made in 18-foot lengths, and all seams are riveted and soldered. Where the lengths join, heavy sheeting is wrapped around the joint and painted with coal tar, so there is little or no leakage along the line. The fan is driven by a 24-inch Pelton water motor, working under a head of 300 feet. An auxiliary air engine is always in readiness in case of any accident to the water motor.

The progress of the tunnel has varied much on account of the variations in the ground encountered. In the month of October, 1898, an advance of 354 feet was made, being the most progress made in any one month. In February, 1899, an advance of only 53 feet was made for the month. In this month a considerable volume of water was encountered with running ground, and little or no progress was made for a week at a time. The average progress to the present has been 7.5 feet per day. It has been found necessary to timber about one-third of the tunnel.

On the completion of the tunnel and its connection

slide filler. Referring to the sectional illustration, it will be seen that the slide (A) screws down on and around the lid of cup, and has a loose plug which covers the filling hole when slide is swung over to a closed position. This loose plug is so arranged that it can be adjusted for wearing by turning down screw (B). The whole construction is very heavy, and the slide can be depended upon to seat perfectly and remain tight for almost an indefinite period. On account of this construction, it is possible to secure a large filling hole, which, as users know, is a desirable feature.

The feed regulating mechanism is the same as the Lunkenheimer "Sentinel" pattern oil cup, and the feed can be put on or off by raising or lowering the cam lever (C). The rate of feed can be adjusted by turning nut (D), which is prevented from loosening by spring (E). By this arrangement the feed can be set and turned on or off without disturbing the rate of flow. The cup is thoroughly packed and can not become leaky. The whole cup is secured together by a patented lock-nut construction, making it impossible for the cup to jar apart, due to the shaking of the engine, and also dispenses with the annoyance of oil leaks. The sight-feed glass (R) is quite large and can be readily cleaned by unscrewing the upper part of the cup from the base piece.

At the close of 1900 there existed in Mexico 10,000 titled mining properties, producing twenty-five different classes of metal. There were 8000 claims titled at the close of 1898. This is an increase of 25% in the last two years. The gain is principally in the States of Sonora, Durango, Zacatecas and Chihuahua. In the Moctezuma mining district, State of Sonora, nearly 1000 claims were denounced before the Agente de Minas in one year, but a greater proportion of these were not surveyed or titled.

THE discovery by Dr. Ludwig Mund of London of a new gas manufactured from coal is reported. It is stated the gas is useless as an illuminant, but valuable for heat and power development, costing only 4 cents per 1000 cubic feet, as compared with 60 cents for ordinary coal gas. Its use, it is declared, will change and cheapen methods of steel manufacture.

It has been discovered that sand which fell in southern Germany during a recent snowstorm came from the Sahara desert in Africa.

Mining and Metallurgical Patents.

Patents Issued May 7, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR BORING TUNNELS.—No. 673,717; A. W. Manton, Wanstead, England.

Combination of face plate carrying cutters, of cylinders to which face plate is fixed, of a fixed bearing upon which cylinder is rotatably mounted, of means for rotating cylinder, of screws fixed to bearing and mounted in nuts upon supports fixed in shield, tunnel or excavation, and of means, such as worm gear, for rotating screws.

PULVERIZING MILL.—No. 673,856; H. L. Kent, Brooklyn, N. Y.

Combination with a revolving ring movable radially, of plurality of crushing rolls within and encircled by ring, revolving on substantially stationary axes spaced apart at predetermined distances, two rolls being movable transversely of axes toward and from inner face of the ring, means for driving one of parts, a casing surrounding ring, bearings for rolls in casing, and springs reacting against movable rolls and casing for pressing rolls outwardly against inner face of ring, whereby pressure of either of movable rolls may be adjusted and ring can move radially in casing to adjust its position to proportionately distribute pressure to several rolls.

CONCENTRATOR.—No. 673,808; D. G. Wherry, Denver, Colo.

Combination of a number of table sections provided with curved riffles and movable about common center, sides of table sections farther from center of motion being lowest, each table section being provided with trough extending along end at one extremity of riffles, means located in central space surrounded by table sections for sizing material and discharging different grades to different table sections, and means for imparting to table a vibratory movement calculated to carry concentrates into troughs, while gangue is discharged over lowermost riffles at outer edge of tables.

PROCESS FOR WELDING STEEL AND COPPER.—No. 673,664; T. Smith and F. G. Sherry, Pittsburg, Pa.

A process of welding steel to copper which consists in heating a steel plate to white heat, placing flux upon steel plate, placing a copper plate upon flux

and steel plate, and then heating the two plates to welding heat and subjecting the two metals to rolls or hammer.

GOLD SAVING, PLACER MINING, AMALGAMATING AND CONCENTRATING MACHINE.—No. 673,806; G. C. Walters, Denver, Colo.

A trough or sluiceway having transverse riffles in its bottom, its side walls being composed of a series of wings curved outwardly from interior points, and merging into abrupt inward curves, each wing on same side terminating where wing immediately in front begins, wings having inclined sides overlapping interior of channel, and jutting points where wings unite being staggered on opposite sides.

FAN.—No. 673,477; J. R. Robinson, Monongahela, Pa.

A casing having central inlet openings and peripheral discharge opening, a fan rotatably mounted within casing and including plurality of blades, flanges directed outwardly and forwardly from each of the blades at side edges adjacent to inlet openings, and end plates connected at side edges of blades beyond first-named flanges, each of blades including inner and outer portions lying radially of fan and relatively offset rotatively of fan and having a connecting portion.

DIFFERENTIAL PUMP.—No. 673,602; J. H. Fox, Cleveland, Ohio.

The combination with a chamber of flexible diaphragms secured transversely across, chamber including between them a chamber constantly filled

with motive fluid under pressure, a ring about margin of one of the diaphragms, arranged to limit its area, central disks of different sizes secured to diaphragms and extending over effective area of diaphragms—a separator between disks, means for admitting to and withdrawing from side of diaphragm of largest effective area the motive fluid, whereby diaphragms are reciprocated, and a pumping chamber adjacent to diaphragms and inlet and outlet valve connected therewith, whereby fluid will be drawn into pumping chamber and expelled therefrom with each reciprocation of diaphragm.

ORE CONCENTRATING TABLE.—No. 673,489; M. P. Willits, Nederland, Colo.

The combination with an endless belt of multiple jigging frames thereunder having an independent reciprocating motion, and screws O in castings N for regulating extent of reciprocating motion of respective jigging frames independently of each other.

CRUSHING ROLL.—No. 673,768; C. R. Fleming, Black Warrior, Ariz.

A pair of coacting crushing rolls, each comprising a shaft, a cylindrical core spring thereon, a series of disks on core spring, movable eccentrically with relation to axis of roll independently of each other, and core spring serving to normally retain disks concentrically with relation to axis of roll, each alternate disk being of greater diameter than intermediate disk, disks having transverse registering openings, heads secured on shaft and bearing against ends of core spring and outer disks, and bolt rods connecting heads and extending through openings, larger disks of each roll engaging smaller disks of the other.

ORE JIGGERS.—No. 673,607; A. L. Le Grand, West Pittston, Pa.

Combination of water tank, stationary guide plates fitted to opposite sides of tank, carrying slides slidably engaging with guide plates, a superposed driving shaft, reciprocating supporting stems connected at their lower ends with the carrying slides and extending upwardly therefrom on opposite sides of driving shaft, supporting pan suspended between slides, normally compressed cushioning springs arranged in an elevated position and encircling upper end portions of stems at opposite sides of driving shaft, means for varying compression of springs, and driving mechanism having operative connections with slides.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The April report of the Alaska Mexican M. Co. shows 13,198 tons ore crushed, yielding \$16,251 and 245 tons sulphurets, valued at \$5398, gross yield \$21,649, an average of \$1.87 per ton; expenses for the month, \$22,934. Good ore is reported on the 300-foot level.

The report of the Alaska United M. Co. shows 25,876 tons ore crushed, yielding \$42,991 and 546 tons sulphurets valued at \$16,947, gross yield \$59,938, an average of \$2.31 per ton; expenses for the month, \$40,215.

The board of signal officers has awarded the contract for laying the cable from Juneau to Skagway to W. R. Brixie of New York at \$70,000, the contract to be completed and the cable in operation on August 1. The U. S. signal corps will operate it.

A new town has been established 2 miles above Kluckwan, on the Chilkat river, near the mouth of the Klakana river, of which the Porcupine is an upstream branch. It is on the American side, but close to the boundary line and immediately south of Wells, in British Columbia, where two mounted police and the British government trail crew stop. The town has been named Troy. F. A. Kreuger has been made recorder and a petition for a postoffice and mail service has been sent to Washington. A ferry is to be put on between Troy and the mouth of the Klakana river for transporting freight and passengers. There are about forty people making Troy their headquarters now, and the number is being added to daily by new arrivals.

ARIZONA.

COCONINO COUNTY.

The contract for a \$40,000 leaching plant for the Coconino M. Co. has been taken by Dederichs & Burke, construction to begin at once. The mill is to have 100 tons daily capacity and the contract requires completion by Aug. 15.

GILA COUNTY.

W. B. Collom has bonded the Golden Wonder mine, near Payson, from Chilson Bros. The mine was opened more than twenty years ago and has been worked, yielding a large amount of gold, the ore being crushed in an arrastra.

YUMA COUNTY.

The Darius G. M. Co. of Tucson has bonded some placer claims at Monitor and will begin work at once; C. Fleming of Tucson is manager.

CALIFORNIA.

AMADOR COUNTY.

The Rising Star G. M. & D. Co. has been incorporated, capital \$300,000. The officers are: W. E. Holbrook, president; L. F. Kaskell, secretary, San Francisco; The First National Bank of San Francisco, treasurer; H. P. Gordon, general manager. The company own the Rising Star group, situated at Plymouth, on mother lode. They propose to sink a double-compartment shaft 1,000 feet, cutting stations from the 500-foot station down, to explore and develop the vein.

BUTTE COUNTY.

The Carlyle mine at Forbestown is being pumped out, and is to be worked this summer. The Miller mine is about to be reopened. The Gold Bank mine is working more than a hundred men.

CALAVERAS COUNTY.

The capital of the Melones G. M. Co. has been reorganized. The number of shares has been changed from 200,000 to 400,000, and the par value has been reduced from \$10 to \$1; \$400,000 6% seven-year bonds, callable at par, is being underwritten by Boston and New York financiers. The stockholders will be given the option of subscribing for the bonds at par, with a bonus of 100 shares of treasury stock for every \$1000 bond. The company holds at the present time 235,000 shares in its treasury, leaving 165,000 shares outstanding. The money from the bonds will be expended in building a mill.

W. F. Hendsch of Copperopolis says the Union copper mines, at Copperopolis, have been bought by Mrs. Hettie Green of New York; work will be commenced at once.

The Jones mine, at Glencose, is bonded by a Boston company, who are preparing to start up; men are engaged in cleaning out and retimbering the shaft, preparatory to erecting a hoist.

It is said the Mokelumne M. & D. Co. have made two large cleanups from their dredging claims, located 20 miles east of Lodi.

EL DORADO COUNTY.

At the Gentle Annie mine, near Placer-

ville, the new incline shaft is down 200 feet. Hoisting works, a 20-stamp mill and a water power air compressor plant are all under construction.

E. W. Wilmer has bought a tract of land near Placerville for the purpose, it is said, of manufacturing Portland cement.

KEEN COUNTY.

J. G. Larrick has bonded a three-fourth interest in the Hard Cash mine, near Randsburg, to B. McAnear and others for \$1500. It is low grade and can be made pay by hauling and crushing at custom mills, but they are experimenting with the ore on the ground by cyaniding after being put through coarse crushing.

The Butte Lode M. Co. has been enjoined by C. E. Ferris and wife, who own the Philadelphia claim, adjoining. They claim that the Butte people since July 1, 1900, have removed ore valued at \$10,000 from the Philadelphia.

NEVADA COUNTY.

George Levinsky of San Francisco, one of the parties bonding the California mine, says they will soon commence work and will put in machinery.

The lower tunnel in the Erie mine at Graniteville has cut the ledge. The ore body is said to be 30 feet thick and sprinkled with gold. There are 660 feet of backs over the tunnel, and it is believed that ore enough will be developed to keep the 20-stamp mill running steadily.

A crushing from the Keystone mine at Nevada City has yielded an average of \$7 per ton. The shaft is now down 140 feet.

The annual stockholders' meeting of Maryland G. Q. M. Co. has been held in Grass Valley. S. P. Dorsey was elected president and superintendent, and L. N. Dorsey secretary and treasurer.

A. Nihell proposed to build a ten-stamp mill on one of the Clark mining claims in Meadow Lake district. Captain Ord of Benicia, Cal., is manager of the company.

The Anti-Debris Association has enjoined the Sargent mine at Quaker Hill. The mine is owned by G. C. Sargent, and has been operated for some time past under a permit from the Debris Commission.

PLACER COUNTY.

The Shady Run Q. M. Co. are preparing to build a 10-stamp water power mill. The shaft at the mine is 140 feet in depth. A tunnel connecting with the shaft extends 235 feet on the ledge, which crosscuts show to be from 20 to 32 feet wide.

A. W. Hutchins and other capitalists are developing the Sellier Con. gravel mine, adjoining the Hidden Treasure. The tunnel is now in 1000 feet.

The Washington G. Q. M. Co. has let a contract to W. S. May of Grass Valley to construct a 20-stamp mill at their quartz mine at Bath.

PLUMAS COUNTY.

It is said that the Sierra Valley Railroad, lately bought by the Southern Pacific, will be extended down the Feather river to a connection with the roads in the Sacramento valley.

SHASTA COUNTY.

It is reported that the company which last year bought the John Wright group of mines, near Igo, intend to put in an air compressor plant on their long tunnel.

The smelters at Bully Hill have been blown in and the plant will now be worked continuously. This is the second big copper smelter to be put in operation in this county.

SIERRA COUNTY.

J. Clinton and others are driving tunnels on the Rainbow mine at Alleghany.

The Pilgrim, near Alleghany, T. A. Patteson Jr. manager, is running a tunnel to reach the vein at greater depth. It has been worked to the surface from the old tunnel, and it is believed that when the new tunnel reaches the ledge the company will build a mill to replace the old one, which was destroyed by a landslide.

SISKIYOU COUNTY.

Bennett Bros., who bought a ledge from Campbell & Co., near the old Last Chance claim on Blue ridge, near Sawyers Bar, are developing it. At present they are sinking on the ledge.—The Orcott Bros. are running a tunnel on a pocket ledge on Graham gulch, near Yocumville, to tap it 40 feet down. About \$15,000 has been taken out since last November.—G. W. Yocum & Son of New River, Trinity Co., have a ledge on Methodist creek, on South Fork of Salmon, which they are developing, and will put a mill on this summer.

The Dewey mine is 8 miles west of Gazelle. The outcrop of the ledge is over 75 feet wide. It is opened by tunnels, only development work so far being done. A 10-stamp mill has been built for sampling; and the Squaw Creek M. Co., who own the mine, are proposing to add thirty stamps, and possibly a cyanide plant.—Harris Bros. have located an 8-foot ledge near the Dewey.—Numerous other locations and discoveries have been made recently in this district.

STANISLAUS COUNTY.

E. L. Barkis of Oakdale has made contracts with land owners on the Stanislaus river, between Knight's Ferry and Oakdale, to dredge the river bed for gold. The consideration stated is 10% of the net receipts.

TRINITY COUNTY.

The Trinity Copper Co. has let a \$10,000 contract for the construction of 5 miles of wagon road from Kennett to the Shasta King copper mine, for which a smelter is to be built. The road must be completed in five weeks.

TUOLUMNE COUNTY.

A. C. Morrison, Supt. Crystalline mine, near Jamestown, expects to have the mine going soon.

The High Point M. Co. of Des Moines, Iowa, have shut down the Manhattan mine, near Stent, and are taking out the machinery.

The old Porto Fino mine at Sonora, idle for many years, is being unwatered. The shaft is to be deepened and the ledge drifted on. A new gallow-frame is being erected and later hoisting works and a mill are projected. J. W. White is Supt.

The Preston Hill G. M. Co. has incorporated to mine near Jamestown. The directors are S. Silliman, Oakland; E. C. Dailey, T. K. Code, C. F. Humphrey, San Francisco; E. T. Hale, Jamestown.

In the Goldwin mine shaft, near Jamestown, at a depth of 435 feet a 7-foot vein with well defined walls was cut into and is of high-grade ore, carrying gold in paying quantities the entire width. A footwall streak about 13 inches wide is said to be exceptionally rich. The mill now being built is expected to be ready to run next week.

The Marshal M. Co. of San Francisco has bonded the Spring Gulch and Canyon mines and will push development work. The first payment of \$4500 has been made. H. J. Sixty is Supt.

The old Solambo copper mine, near La Grange, is being unwatered preparatory to resumption of work. In the sixties the mine was operated by a French company, and considerable ore was shipped to Swansea, Wales. The mine is now owned by C. E. Hensley, who is reopening it.

The Olsen mine at Golden City has been bought at sheriff's sale for \$10,000 by H. Willey of Santa Cruz. The mine was operated in early days and produced largely in gold and silver, but it is now thought to be more valuable for copper, for which it will be worked.

The Anderson mine, near Algerine, is being reopened by T. F. Woodside, the owner. This property is situated on the central belt of the mother lode.

The Continental mine, at Columbia, has resumed operations under the superintendency of A. S. Graham.

A strike is reported at the Nonpareil at Big Oak Flat. A quartz ledge was cut in the lower level west from the main shaft. This is the first quartz vein that has been encountered in this mine, the pay ore thus far having been all in slate. At present they are hoisting with a whim, and using a small boiler and engine are used for pumping. It is the intention to sink a new shaft, build a hoist and possibly a mill this season.

YUBA COUNTY.

At Brownsville the Clark mine tunnel is being cleaned out and retimbered, preparatory to reopening.

COLORADO.

BOULDER COUNTY.

The strike in the Gladys at Wall Street is widening with depth. The mine is owned by C. W. Caryl, but is bonded to Mrs. S. J. Cook.—The Elkhorn Co. says it has cut a vein of \$20 ore in its tunnel. Machinery has been put on and other improvements will be made.

A strike is reported from the Slide Spur mine, at Gold Hill, owned by W. Teller of Denver, but bonded to Andrew & Wilson. The ore was opened in 700-foot level, is 18 inches wide and shows free gold and sylvanite. Shipments made daily return \$200 a ton. The lessees have netted in two weeks \$2700 over expenses and a royalty of one-third.

CHAFFEE COUNTY.

It is reported that the Hershberger tunnel, Cameron district, has opened one of the largest bodies of ore ever found in the Turret and Cameron districts. It is now 250 feet into Cameron mountain, and 150 feet from the surface.

The strike of copper ore at Howard, which B. T. Brooks claims as one of the best copper prospects ever found in that section, shows up well. The vein is from 2 to 4 feet thick on a quartzite and gneiss contact and shows great masses of extremely high-grade ore.

EAGLE COUNTY.

The Red Gorge M. & M. Co., S. B. Swink of San Antonio, Texas, president,

owns seven claims at Red Cliff. This company propose to erect a mill at once.

GUNNISON COUNTY.

The company represented by W. Graflin has bought the Iron Cap mine in the Willow Creek district for \$25,000. A shaft is down about 130 feet.

H. Miller, D. E. Turner, J. C. Lewis and G. N. Wheeler, of Denver, have incorporated the Sulphide Copper Co., capital \$1,250,000, to mine the Lucky Star, Hard Cash and Occidental lodes in the Rock Creek district.

A find is reported from Taylor Park, where a vein of graphite 20 feet wide has been discovered. Samples have been sent to users and tested with satisfactory results.

GILPIN COUNTY.

McFarlane & Co. have commenced the erection at Nevadaville of the new rapid-drop stamp mill building of the Avon G. M. & M. Co.

S. Hoskin, manager of the Colorado-Carr M. & M. Co., has bought for his company the Eagle, Golden Eagle and Double Eagle lodes, Lake district, the price paid being \$50,000 cash. They are so situated as to be worked through the main shaft of the Carr by crosscuts from the vein. The company is composed of Antwerp, Belgium, and London, England, investors. They are now preparing to construct an aerial tramway 6200 feet from the Carr mine to the Randolph stamp mill.

A meeting of Eastern capitalists largely interested in mining in Gilpin and Clear Creek counties is reported to have been held in Denver, at which it was decided that the solution of many problems in connection with the marketing of their ores is the erection of an independent smelter near Denver. The cost of this smelting plant will be about \$350,000, and the construction is to be commenced in four months. It is said that a number of the leading miners of the two counties interested are to take an interest in the project.

A company with a capital of \$100,000 has been organized in New Orleans by J. P. Adams and others, to operate the Defiance mine, in Russell gulch; W. S. Robertson will be Supt.

JEFFERSON COUNTY.

The Carpenter smelter at Golden is under cover and it is expected that the plant will be ready to blow in about June 15. It will have a daily capacity of 300 tons.

LAKE COUNTY.

A suit has been brought in the U. S. Court by the Fortune G. M. Co., Leadville, against the Resurrection G. M. Co., E. Smith and C. T. Carnahan, claiming \$100,000 for ore extracted from the Fortune ground by the defendants and \$50,000 damages. The trespass and extraction of \$100,000 worth of ore complained of is said to have occurred in 1898 or 1899, but was not discovered until the Fortune workings were extended to where the alleged extraction of ore occurred.

OURAY COUNTY.

The Altoona M. Co. proposes to develop the Altoona group, near Ouray. Machinery will be put up soon.—The Camp Bird extension will commence work on the Ironton side as soon as the transportation of supplies is practicable.

PITKIN COUNTY.

Judge J. W. Johnson of Denver has bought for a Denver syndicate the Ophir and Queen Con. mining properties at Aspen.

CLEAR CREEK COUNTY.

The Marshall and Russell G. M., M. & T. Co. has been incorporated, capital \$5,000,000, to mine at Empire, where it owns a large number of claims. The principal people interested are D. A. Russell, O. Merryhew, F. C. Russell, R. Corbin, C. Corbin, W. G. Davis, T. H. Davis of Pomeroy, and C. Crary of Huntington, West Virginia. Operations are to be commenced at once. A mill and a power plant are to be built, and the claims are to be developed by a tunnel.

The Waldorf M. M. & T. Co. has bought for \$125,000 in cash the Stephens group in the Argentine district, comprising 28 patented claims and six millsites, comprising in all about 110 acres, with a record of production of \$2,000,000 in gold, silver and lead.

F. L. Branham, W. Ennis and J. Campbell have leased the big dump of the Kirtley mine at Georgetown, which will be shipped to the smelters. There are over 2,000 tons that will run from 30 to 50 ounces silver per ton in gray copper, which cannot be successfully concentrated. It is thought that the entire dump can be smelted at a profit, for when first opened it took 100-ounce ore to pay.

The Sun & Moon Co. at Idaho Springs have elected J. W. Britton of Cleveland president; G. G. Snowden of Cleveland secretary and treasurer. Manager Sims has been authorized to buy new machinery,

and will put in an air compressor 16x16 in size at once.

SAN JUAN COUNTY.

Edsall, Key & Co. are said to be the buyers of the Silver Queen mine at Silverton for \$100,000. They have taken possession and propose to develop it by installing \$65,000 worth of new machinery. The present stamp mill of twenty-five tons capacity is to be quadrupled, a tramway built from the mine to the mill, with flumes, reservoirs and wagon roads.

SAN MIGUEL COUNTY.

A statement accompanied by the figures from the books of the company by A. L. Collins, manager of the Smuggler-Union mine at Telluride, shows that in the month of April 146 men, working 3405 shifts, received on contracts in the mine \$10,790.05, an average of \$4.06 a shift. Two men received \$8.23 a shift, the highest, and two men \$1.53 a shift, the lowest. On only 4774 shifts was the sum earned less than \$3 a shift—that is to say, over 86% of the total number of shifts worked earned over \$3.

The strike on the Smuggler-Union mine at Telluride will probably result in suspension of operations for about three months. The company will remodel the old mill and make some changes in the new plant. The machinery has all been taken out of the old mill and will be replaced by 120 stamps, with a capacity of about 400 tons per day. When the company starts up again it will be with an increased force.

TELLER COUNTY.

It is reported that Chas. Butters has worked out the treatment scheme for the profitable handling of low-grade Cripple Creek ores. It is understood also that the directors of Stratton's Independence have arranged to erect a mill at the mine to treat the dump, which will run on an average above \$8 per ton, as against \$3 cost of the treatment. The average dump of the Cripple Creek mines will contain from 25,000 to 100,000 tons of low-grade stuff. Mr. Butters is understood to have made propositions to several of the big mines to handle the dumps.

The Solitaire Leasing Co., operating the Columbia at Cripple Creek, has struck a vein 360 feet from the surface, which, at first 1 inch, is now 10 inches wide and carries values up to thirty-six ounces gold per ton.

IDAHO.

BLAINE COUNTY.

W. Darlington has bonded the copper claims and improvements in Big Copper basin, 42 miles from Hailey, from N. J. Sharp of Hailey and his associates. A smelter was built on the property a year ago by Portland parties, who shut down unable to make the ores pay.

IDAHO COUNTY.

E. B. Simmons, of Dixie, says the main shaft of the Ajax mine is down 330 feet, and the 20-stamp mill will be installed as soon as the roads will permit of hauling the machinery.

F. Brown, of Mount Idaho, has bought a 2-stamp mill and concentrating plant for the Jumbo mine at Buffalo Hump. It is expected the mill will be running early in June.

SHOSHONE COUNTY.

The August and Sunset claims have been bonded to Butte parties by E. E. Horst of Kingston and E. L. Powell of Spokane. It is understood development will be pushed.

It is reported that all the silver and lead mines in the Coeur d'Alene country are to be consolidated and operated under a single management. It is expected by the consolidation to make the regulation of the price of lead an easier task.

MONTANA.

BEAVERHEAD COUNTY.

A new air compressor and 1000 feet of piping have been taken up to the Polaris mine, in the Lost Cloud district. It is reported that J. E. Rickards and J. MacGinniss of Butte have secured another lease on the Polaris.

A. Manser, Supt. of the Montana C. & G. Co. of Chicago, developing the Manser mines, near Dillon, states that he has a few men grading site for a new hoisting plant, which will be installed, with a capacity for sinking to a depth of 1000 feet.

FERGUS COUNTY.

Henry Wick of New York, a director in the American Steel Co., has joined Finch & Campbell of Spokane in the purchase of the Kendall mines, near Maiden. They have made the first payment of \$100,000 and have taken possession. H. T. Kendall has retained a one-tenth interest. The new owners will enlarge the mill and construct the ditch to bring water from Warm Spring creek. R. T. Neill, agent, will let the contracts for the ditch and

superintend the commencement of other projected improvements.

Lewistown, May 8.

It is reported that the Burke & Sweeney sapphire mines, near Lewistown, have been bonded at \$50,000, and that extensive improvements will be made at once. The syndicate consists of C. D. McClure and P. A. Fusz, who are interested in the Granite Mountain property at Phillipsburg, and D. Jankower of New York. They have incorporated the American Gem Mining Syndicate.

During April the mill of the Great Northern M. & D. Co. at Gilt Edge crushed 4100 tons of ore, producing \$33,000 in bullion. The average return was \$8 per ton.

The first bullion shipment for May from the Central Montana Mines Co., Whiskey gulch, was nearly \$5000—the output of the mill for twelve days' run.

FLATHEAD COUNTY.

It is reported that Sanford & Grubb of Kalispell, owners of the Blacktail group, West Fisher, will build a mill on their property this summer.

MADISON COUNTY.

It is reported that N. and H. C. Ptomev will build a five-stamp mill on the Lucas mine at Summit.

MISSOULA COUNTY.

The Western Montana Cyanide M. Co. of Butte has taken an \$8,000 bond on the Dickson placer patent in Nine-Mile creek.

NEVADA.

ELKO COUNTY.

Supt. A. H. Smith of the Murphy-Curieux mine, at Bull Run, says that the mine will be reopened soon, employing from fifteen to twenty men.

ESMERALDA COUNTY.

The Tonapah mines are changing and improving with depth. The values are changing from a large silver value to a large gold value. Some adjoining claims are proving excellent and are being worked by leasers.

WASHOE COUNTY.

It is reported that nothing but shipping ore is coming out of the Bell and Wedekind mines, Reno, being over \$2000 a day, which will be increased when openings are extended far enough to permit of bigger shifts being worked.

NEW MEXICO.

TAOS COUNTY.

A sale of five mining claims near Tres Piedras for \$5000 has been made to Detroit parties.

J. P. Rinker has sold the Mineral Point claim at Hopewell for \$1750 to R. C. Moody of Cleveland, Ohio. A corporation will work it.

It is said \$20,000 will be expended developing the Elliott group in Cow Creek, lately bought by Pittsburg people.

The Unity C. & G. Co. of Boston, Mass., have bought six claims on Spring creek and are preparing to work them on a large scale. Mr. Driscoll is manager.

The New Mexico C. & G. Co. of Milwaukee, Wis., owners of the Strawberry claim, have put in a compressor and pump.

SOCORRO COUNTY.

The Bell-Hanna mine at Rosedale has been sold to Eastern people, who intend to erect a stamp mill. L. M. Lasley is Supt.

OREGON.

BAKER COUNTY.

Tests of ore from the Concord mine at Baker City are to be made in the stamp mill of the May Queen preliminary to construction of a mill on the Concord.

GRANT COUNTY.

The Scandia M. & M. Co., of Granite, is preparing to explore all the underground ledges of Quebec hill. At a stockholders' meeting, recently held in Spokane, it was decided to put in power drills. The tunnel is 7 feet clear between timbers and is made for a double track.

A nugget is reported to have been taken from the placer mine owned by R. Cannon of Spanish gulch and W. H. Johnson & Son of John Day, in the Spanish Gulch mineral belt. The nugget weighed about twenty-five pounds, contained considerable quartz and was valued at \$2500.

UTAH.

BEAVER COUNTY.

The Royal M. Co. now owns and operates the old Cactus mine, near Frisco. Development proceeds from a 200-foot shaft.

The old Carbonate and Rattler group, in former days among the most prominent propositions at Frisco, have been sold to M. P. Gilbert and associates of Salt Lake City for \$100,000, payable in eighteen months. For 400 feet of sinking upon new shaft a contract has been let. The old bullion record shows a production of \$800,000 in silver-lead ores.

GRAND COUNTY.

The National Copper Co., having six claims in the La Sal mountains, is developing. The incorporators are J. E. Smith, C. E. Peyton and others of Salt Lake City. Work has uncovered copper ore in the form of chalcopryite and bornite in a lime and porphyry formation.

IRON COUNTY.

The contract for the \$80,000 mill of the Ophir M. Co., at Stateline, has been awarded to Dederichs & Burke of Salt Lake City. The contract provides for completion early in September.

JUAB COUNTY.

The Lower Mammoth Extension M. Co. has incorporated, capital \$75,000, to operate the Anita, Anita Fraction and Anita Fraction No. 1 mining claims, at Tintic. J. Chipman is president and M. W. Taylor vice-president of the company.

The Cyclone M. Co. has incorporated to mine the Cyclone and Tip Top claims, at Stockton. The Tip Top has been opened by a shaft, exposing a high grade of silver-lead ore. The Cyclone claim has been opened up by an incline.

KANE COUNTY.

It is reported that big finds of copper ore are being made along the Colorado river. The new district reaches as far north as Kane county and extends as far south as Mohave, in Arizona.

PIUTE COUNTY.

The Annie Laurie, located 16 miles from Sevier station, on Gold mountain, at an altitude of about 9000 feet, is developed through tunnels and produces a gold ore that is well suited to cyanide work. The mill has a capacity of 150 tons per day. A refining plant is to be put in to reduce the auro-cyanides to bullion. The values extracted amount to about \$10 per ton. A water wheel is being put in to operate an electric generator. A compressor plant is also being added. Walter G. Filer is the manager.

SUMMIT COUNTC.

The St. Louis Ontario M. Co. has incorporated, capital \$50,000, to mine the Dewet Nos. 1, 2 and 3 and the Kruger Nos. 1, 2 and 3 mining claims at Park City. Work is to begin at once. G. H. Lippelt is president and H. C. Brownlee secretary.

The Silver Star M. & M. Co. has incorporated, capital \$100,000, to mine the Amphion, California and Panneka mining claims in Park City. M. S. Hammer is president, T. L. Hammer secretary and treasurer.

TOOELE COUNTY.

The Sacramento M. Co., Mercur, during 1900 mined and milled 42,537 tons of ore, which yielded \$115,789.96 gold. During the year \$22,394.49 was expended on improvements and \$75,487.14 on operation, the cash balance for the year being \$25,479.10. The report shows the cost of mining and milling with an expense item for experiments with the new roaster had been confined to \$1.77 a ton, this to be further reduced. Glen R. Bothwell of Salt Lake City was elected president; Robert E. McConaughy, secretary and treasurer.

The clean-up at the Con. Mercur's big mill at Mercur for month of April is \$160,000.

G. C. Moore, manager of the syndicate owning the Sunshine mine and mill at Sunshine, Camp Floyd district, has begun work underground on the mine and in the autumn expects to start the mill, which will meanwhile be added to with additional tanks and a roaster to treat the arsenical ores.

The Sunshine M. Co. will start up its mine and mill at Sunshine, in charge of G. A. Moore.

UTAH COUNTY.

The Chicago-Utah Onyx Co., G. R. Potter, manager, Salt Lake City, are quarrying onyx at a point 14 miles west of Lehi. The onyx is gotten out in cubical blocks. It will be conveyed by tram line down to the edge of Utah lake, thence in barges across the lake to the railroad.

WASHINGTON COUNTY.

G. Snyder, superintendent of the Dixie, near St. George, reports ore carrying from 25% to 30% copper now going to the smelter, from which 100 tons of copper bullion is produced monthly.

WASHINGTON.

FERRY COUNTY.

Returns from a shipment of nineteen tons of ore from the Morning Glory mine, Republic, were \$140 a ton.—The Quilp compressor plant is running and fifty tons of ore will be sent daily to the Republic mill.

A placer strike on Granite creek, 2 miles west of Republic, has been made and hundreds of men and many women have staked the creek for a distance of 12 miles from its mouth. Work on the diggings where gold was found resulted in finding \$75 worth of shot gold the first day. One nugget valued at \$8 is

exhibited. Prospectors are panning gravel all along the creek, and in most cases are getting colors. The gold seems to carry some silver and is worth about \$15 an ounce. Bedrock is 15 feet below the surface.

A strike of gold-silver ore is reported from the new camp at Meteor, on the south half of Colville reservation, about 90 miles northwest of Spokane.

LINCOLN COUNTY.

Capt. J. Gray, Supt. of the Crystal, says that on the 300-foot level there has been cut a 7-foot vein.

SKAMANIA COUNTY.

A. Olsen, foreman at the Cascades Calumet mines, in the St. Helens district, says the Norway mine dump has hundreds of tons of ore piled up ready for shipment to Castle Rock as soon as the wagon road is completed. He has taken contracts for continued work upon the Norway and for a tunnel for the Swedish M. Co. upon the Upper Sweden and a shaft upon the Lower Sweden claim.

WYOMING.

ALBANY COUNTY.

It is said that the owners of the Rambler copper mine, near Laramie, decided to abandon the property, when the mine foreman said he would put in just one more shot for luck. This shot is said to have opened up one of the largest and richest veins of copper ore ever discovered in the Rocky mountains.

FOREIGN.

BRITISH COLUMBIA.

The Truine mine at Ferguson is to be started up, and an aerial tramway installed to enable working the mine the entire year.

It is reported that 6 feet of high-grade ore has been struck in the 400-foot level in the west end of the Cariboo at Camp McKinney.

The payshoot of the Wonderful, Slocan, has been found in the tunnel where it had been opened under some former management, but for some reason abandoned, the drift being filled with waste. W. W. Warner, who leased the mine, cleaned out the drifts and found a 2-foot vein, assaying 115 ounces in silver and 70% lead.

W. H. Jeffery, M. E., who has an option on the stock of the Kaslo Smelter, Ltd., has interested capital to erect plant, build railway spurs, wharves and docks, tramways and other necessities for the running of a large smelter at Kaslo. Actual construction, it is said, would commence by the first of July.

W. A. Dier of Victoria has bought the Copper Canyon group at Mount Sicker, Vancouver island, including the Victoria, Susan and Copper Canyon claims, also the Amoka group—the May and Star—and the Yankee, adjoining the Tye, for, it is said, \$336,000. An equipment of machinery will be put on this summer.

The lower or No. 4 tunnel on the I X L, Rossland, at 220 feet has cut the shoot of ore found first in the No. 3 $\frac{1}{2}$ tunnel. R. Clarke is manager.

The Winnipeg mine in Wellington is drifting in ore on the 400-foot level. The vein on this level is 12 feet in width.

J. W. Bryden has been exploring the properties of the Green Mountain M. Co. at Rossland with a diamond drill, and has located a number of very large ledges, some of which carry pay ore.

J. W. Bryden, M. E., has gone 100 miles up the Skeena river to operate sulphur deposits which have been partially developed and are said to be extensive and valuable. They are the only deposits of the kind so far opened up in British Columbia.

DUTCH EAST INDIES.

Prospectors visiting the islands succeeded in discovering gold, copper and gem stones, but found it impossible to develop their finds, owing to the opposition of the jealous Dutchmen who owned the land. Lately a way of getting around this has been found. The prospector now arranges with a prominent Dutch capitalist to apply for concessions and open the mine, the former getting a paid-up interest and the management. A number of large mining operations are being carried on in this way with satisfactory results. The Government of the Netherlands is beginning to realize the value of development of the mineral resources of the Dutch East Indies, and Dutch subjects can now obtain concessions for mining over country embracing hundreds of square miles, at the merely nominal rental of 2 cents per acre per annum, for a period of ninety-six years, and a royalty on the value of the gross yield of 4% per annum. The East Indian mining regulations are intricate and unfair, and miners desire a new, up-to-date mining law. Another trouble miners in the Dutch Indies experience is caused by officialism and red tape. Passports, concessionaire decrees and petitions have to be produced continually. To ob-

tain a mining concession a miner must possess unlimited Dutch patience and be prepared to pay. But, notwithstanding, mining is progressing in the Indies. In Celebes an Amsterdam company is working a valuable gold mine at Penogo. It contains three ledges from 8 to 15 feet wide. They have been opened by tunnels to a depth of 600 feet and assay about an ounce of gold per ton. At present the ore is free-milling; the gold is pure and is worth \$4 per ounce. Native miners are employed at a weekly wage of 4 shillings. At Bone, about 15 miles from the bank of the Gorontalo river, a large copper mine is being worked. The lode is of great length and measures nearly 200 feet in width. It is being worked as a quarry. The average ore is estimated as containing between 3½% and 6% copper and a little gold and silver.

MEXICO.

President Greene says that 300-ton smelters would be added to the Greene Con. plant, in La Cananea, until a total capacity of 5000 tons daily was reached. There are now 1500 people in the camp, and the number is expected to increase to 5000 by the end of the year.

Personal.

E. C. VOORHIES of Sutter Creek, Cal., is in San Francisco.

CHARLES WOLF, Supt. Gold Hill mine, Calaveras county, Cal., has resigned.

J. D. STEVART of Gold Run, Cal., has been appointed Supt. of a Calaveras, Cal., drift mine.

GEORGE H. WYMAN has resigned as superintendent of the Checkmate mine at Pearl, Idaho.

VICTOR M. CLEMENT returned to Salt Lake City, Utah, from Parral, Mexico, on the 10th inst.

MAJOR R. G. EDWARDS LECKIE has resigned as manager Republic M. Co., Republic, Wash.

J. E. KERRICK of Salt Lake City, Utah, is at Baker City, Oregon, inspecting mines for Chicago people.

PROF. E. C. ENGLEHART, chemist and metallurgical engineer of Denver, Colo., is in Los Angeles, Cal.

H. DEC. RICHARDS, manager of Orleans Bar G. M. Co., at Orleans Bar, Humboldt Co., Cal., is in San Francisco.

H. L. JOHNSON, Supt. Oriental mine at Alleghany, Cal., has returned there from a business trip to Denver, Colo.

A. A. BLOW, consulting engineer Sheba G. M. Co. of South Africa, is in Denver—his former home—on mining business.

C. S. BATTERMAN, Supt. Butte & Boston mines, Butte, Mont., is inspecting the Bluestone mine, near Winnemucca, Nev.

JOHN A. KING, superintendent of the Verde Queen C. Co., at Jerome, Arizona, is in Denver, Colo., on a short business trip.

E. H. WILSON, late of California, has been appointed manager of the Kokomo-Pioneer M. & M. Co., at Idaho Springs, Colo.

J. W. DUNLAP, Supt. Devil's Basin Con. G. M., at Deadwood, Placer county, Cal., was in San Francisco during the past week.

ADOLPH MULLER, formerly of Nevada City, Cal., is now Asst. manager Adjah Bippo M. Co., in the Ashanti country, Africa.

B. L. JONES of Boston, Mass., is located at Jerome, Arizona, as assistant to E. A. Powers, superintendent of the United Verde Ex. Co.

MARK B. KERR has returned to Grass Valley, Cal., from San Francisco. He is a candidate for the office of Debris Commissioner of California.

W. S. GRAHAM, civil engineer and county surveyor of Placer county, Cal., is a candidate for the office of Debris Commissioner of California.

ARTHUR HOWLAND, late Supt. Davis Hydraulic mine, at Jump-off-Joe, Or., is going to Sumatra to examine prospects there for an Eastern syndicate.

DR. DAVID T. DAY of the U. S. Geological Survey, who is Supt. of the Mines Building at the Buffalo Exposition, had his building ready on the opening day—a distinction shared only by the exhibit of the U. S. Fish Commission.

Books Received.

The Fergus County Argus, published at Lewistown, Mont., has issued a pic-

torial edition, descriptive of the county, its resources, industries and people. It is pictorially and typographically an exceedingly fine exhibit of newspaper enterprise.

"Induction Coils," by H. S. Norrie, published by Spon & Chamberlain, 12 Cortlandt street, New York, 270 pages, 12 mo., is the second edition of this work, which has been revised and, with added new matter, has been brought down to an expression of the latest American practice. Gas engines and spark coils, new method in X-ray working and the latest on wireless telegraphy, are clearly and exhaustively discussed. The book is an excellent text and reference book on the electrical subjects it treats of and should be in the library of electrical students and practical workers in the art. Price, cloth, \$1.

Commercial Paragraphs.

FAIRBANKS, MORSE & CO. have established a branch house in Salt Lake City, Utah, with C. P. Mason as local manager.

THE office and business of the Wright Manufacturing Co., manufacturers of high-grade steam specialties, Cleveland, Ohio, have been removed to Detroit, Mich., where the business of the company will hereafter be transacted.

VICKERS' SONS & MAXIM, the largest manufacturers in the world of war material, who have immense works in England, and who supply all foreign Governments, have recently equipped their plant with Cross oil filters manufactured by The Burt Mfg. Co. of Akron, Ohio.

Recently Declared Mining Dividends.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, \$2 3/4 @ 3 1/4 c 3 lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c 3/4 lb.; soda ash, \$1.90 3/4 100 lb. 58%; hyposulphite of soda, 2 1/2 @ 3c 3 lb.; blue vitriol, 5 1/2 @ 6 1/4 c 3 lb.; borax, concentrated, 7@8c 3 lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2 1/2 @ 2 1/4 c; California refined, 1 1/2 @ 2c; nitric acid, in carboys, 8c 3/4 lb.; caustic soda, in drums, 3@4c 3 lb.; Cal. s. soda, bbls., \$1.00; sks, 95c 3/4 100 lb.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 7, 1901.

673,591.—COIN CALCULATOR—G. A. Aldrich, S. F.

673,671.—SEPARATOR—J. Anderson, Walla Walla, Wash.

673,752.—MIRROR SUPPORT—Bader & Cartwright, S. F.

673,376.—ELECTRIC SIGNAL—H. R. Bennett, S. F.

673,390.—VEHICLE WHEEL—J. P. Erie, Los Angeles, Cal.

673,768.—CRUSHING ROLL—C. R. Fleming, Black Warrior, Ariz.

673,555.—PRINTING PRESS GRIPPER—V. A. Hancock, S. F.

673,651.—BUTTON SEWING MACHINE—F. T. Leiloh, S. F.

673,563.—ELECTRIC LAMPS—G. B. Miller, S. F.

673,447.—CURTAIN ROD BRACKET—E. M. Noid, Pasadena, Cal.

673,846.—DECOY DUCK—H. A. Ranert, Portland, Or.

673,737.—MORTISING MACHINE—W. J. Smith, Detroit, Or.

673,851.—BALL BEARING—Williams & Mitchell, Spokane, Wash.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the National Cons. Mining Company will be held at the office of the company, 773 Mission St., San Francisco, California, on MONDAY, the 3d day of June, 1901, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

GEO. W. FLEISNER, Secretary.

Office—773 Mission St., San Francisco, California.

Notice of Meeting of Stockholders.

In accordance with the by-laws of that company, the Regular Annual Meeting of the Stockholders of the JAMESON MINING COMPANY, for the purpose of electing Directors for the following year and transacting such other business as may properly come before it, will be held at the office of the company, rooms 54-59, No. 120 Sutter street, San Francisco, California, at 2 o'clock P. M. on MONDAY, the 20th day of May, 1901.

SAM W. CHEYNEY, Secretary.

MOHICAN MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1901, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 300 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 14th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. CLASSEN, Secretary.

Office—300 California St., San Francisco, California.

BRITISH COLUMBIA MINES.

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700, Nelson, B. C.

SITUATIONS WANTED.

After May 20, a young man (33) with college training and three years' experience as assayer, cyanider and assistant superintendent, successively, with prominent mining company, wishes a similar position, or would manage a small property at a reasonable salary. References. Address M. T., 880 Eddy St., San Francisco.

WANTED.—POSITION BY A YOUNG ENGINEER with good education and several years' experience in various branches of electrical work. Position in power transmission work preferred. Address "H. J.," care Mining and Scientific Press.

ASSAYER, BOOKKEEPER, TYPEWRITER and General Office Man desires a situation. Ten years' practical experience. Best references given. Address A. Sayer, care of Mining and Scientific Press office.

WANTED.

WANTED.—I have orders from Eastern capitalists for the following described properties: One large, well equipped gold mine with ore in sight, and improvements, to justify a value of from \$1,000,000 to \$5,000,000; also, one large copper mine of like size and value. All business strictly confidential. Apply to E. J. FRASER, No. 522 Farrott Building, San Francisco, California.

Wanted, A Young Draughtsman.

One experienced in smelter work preferred. Address ALFRED VON DER ROPP, Selby, Cal.

WANTED.

A Man Who Understands Building a Brick Reverberatory Furnace.

Party with some capital preferred. Have contract to build one at once. Must be practical and experienced. Address "B. L. R.," care Mining and Scientific Press.

Placer Deposits.

Parties interested in placer deposits that cannot be successfully operated, owing to a lack of water, should communicate with THOMAS A. EDISON, Orange, N. J.

THE ROBINSON "WONDER" Placer Mining Machine.

The Greatest Placer Mining Machine Ever Invented.

Saves All the Gold, Even FLOUR Gold. Requires Only Limited Water Supply. An Ordinary Driven Well Will Furnish All the Water Needed.

Capacity 2 Tons to 200 Tons Per Hour. A Machine That Has Stood the Test.

READ WHAT OTHER PEOPLE SAY OF IT:

Mr. A. Y. Gordon, Elkhorn, Colo., April 26, 1901: "Your 'Wonder' Placer machine is the greatest gold saver I have ever seen. It saves the finest Flour Gold. With an 18-inch machine one boy and myself will wash 2 tons of gravel per hour."

From Mr. T. R. Andrews, Matapa, Sonora, Mexico, April 12: "It is the greatest machine of its kind in existence. It saves every atom of gold and its capacity is truly marvelous."

From the Johnson Assaying Co., San Francisco, April 13: "We have tested your machine thoroughly and are greatly pleased with it. It saves all the gold and is the best machine of its kind we have ever seen."

THE S. H. SUPPLY CO.,

THE MACHINERY DEPOT OF THE WEST,

22d and Larimer Streets, DENVER, COLO.

During the past three months we have dismantled three mills: the Royal Gorge Mill, Canon City; the Oneida Reduction Works, Victor, Colo., and the Gold Brick Mill at Gunnison, Colo. The first of these was in actual operation less than thirty days; the second, ninety days, and the third one year. In all of these mills amalgamating machinery was used, and the consequence is that we have a great assortment of this class of machinery. For use it is as good as new in every respect. We are offering this machinery at a saving of from 50% to 75% over the cost of new machinery. We have:

14 Standard Amalgamating Pans.
7 8-Foot Settlers.
4 Cleanup Pans.
8 Amalgam Safes.
15 Quick Elevators.
4 Amalgam Cars.
5 Quick Tanks.
3 Retorts and Bullion Furnaces.

Two of these mills were dry crushing, containing the following roasting and drying machinery:

Howell Improved White Roasting Furnace (60x27).
3 18-Foot Revolving Ore Dryers.
1 Bruckner Roasting Furnace.
1 40-Foot Pierce Roasting Furnace.

All of these plants were fully equipped with power, including Corliss engines (18x42); tubular boilers and Heine water tube boilers; feed water heaters, and pumps.

Thousands of feet of rubber and leather belting, shafting, pulleys and hangers are in our warehouses. Write for our prices.

The air compressors we have in stock and can make immediate shipment on, are:

12½x14 Ingersoll-Sergeant.
16x14x10½ Norwalk.
12x14 Rand.
10x12 Knowles Belt Driven.
6x8 Knowles Belt Driven.

Our new catalogue is just issued and we will send you one if you ask for it. It contains a large amount of good information in regard to prices, as all of them are put in plain figures. No discounts. Send for it.

120-Stamp Mill

At Hassel, Montana,

FOR SALE.

Will be Sold as Separate Items or Entire Mill.

Erected in 1897 by the Union Iron Works of San Francisco.

Only Partially Operated for a Few Months.

Guaranteed in Splendid Condition.

WILL NAME PRICES F. O. B. TOWNSEND, MONTANA, OR DELIVERED.

SPECIFICATIONS (Condensed).

- 2 NO. 5 McCULLY GYRATING CRUSHERS, with steel wearing parts.
- 26 ORE BIN GATES, 20" x 24", made of 5/8" steel plates, with racks, guides, boxes, pinions, shafts and hand wheels.
- 11 UNION CHALLENGE ORE FEEDERS, 11 right and 11 left.
- 11 10-STAMP BATTERIES. Stamps weighing 1000 lbs. each, arranged to be run in mortars of 5 stamps each, driven by belt and tighteners. Mortars especially arranged and designed for inside amalgamation, and weigh with apron 6500 lbs. each. (5 batteries never used.)
- 66 COPPER PLATES, 4' x 5', weighing 5 lbs. per square foot, plated with one ounce of silver per square foot.
- 6 OVERHEAD CRAWLS, complete with Norway Iron Hooks
- 2 4-WHEEL CRAWLS FOR CRUSHERS, with Norway Hooks.
- 420 LINEAL FEET 1/2 x 1 1/2 TRACK.
- 6 1-TON DIFFERENTIAL CHAIN BLOCKS.
- 2 3-TON BLOCKS FOR CRUSHERS.
- 47 UNION IMPROVED 4' VANNER CONCENTRATORS, complete in every particular. (29 never used.)
- 2 AMALGAM CLEAN-UP BARRELS, 28 x 36.
- 1 AMALGAM CLEAN-UP BARREL, 20 x 30, complete with tight and loose pulleys.
- 3 4' SWINGING BATTEAS and all fittings complete.
- 1 CAST IRON WASH TANK for clean-up work, 48 x 30 x 16.
- 1 HORIZONTAL 12" GOLD RETORT with all iron work complete.
- 1 SET OF IRON WORK FOR BULLION MELTING FURNACE.
- 1 MAIN DRIVING PULLEY, 78 x 23 1/2.
- 2 MAIN ROPE DRIVE WHEELS, 168", grooved for five 1 1/2" ropes.
- 1 LOT, being all necessary shafting, hangers, pulleys, belting, etc., for mill.
- 1 LARGE LOT OF PIPING, all sizes.
- 1 RAND DRILL COMPANY'S COMPRESSOR, 16 x 22, Class D, duplex (never used).
- 1 RANKIN & FRITSCH 16 x 42 CORLISS ENGINE.
- 1 HORIZONTAL RETURN TUBULAR BOILER, 75 H. P.
- 1 3-PHASE ALTERNATING CURRENT GENERATOR, 500 K. W., 60 cycle with 24 poles, type A. P., volts full load 2400, A. M. P. 120, revolutions 300, with rheostat.
- 1 ELECTRIC GENERATOR OR EXCITER, 12 1/2 K. W. Multipolar Direct Current Exciter, type M. P., class 4-12.5-12.75, volts 125, with rheostat.
- 1 MARBLE GENERATOR SWITCHBOARD PANEL, 30" x 90" x 2", containing one general field rheostat, one exciter field rheostat, one station transformer, one potential indicator, one current indicator, one pilot lamp, one ground detector with plug and receptacle, 3 type L lighting arresters, 6 feeder fuse blocks, one double pole exciter switch, two single pole switch brake 2000-volt switches, iron angle frame.
- 3 3-PHASE INDUCTION MOTORS, type "I," class 12-150-600, form "A," H. P. 150, cycle 60, volts 2080.
- 2 3-PHASE INDUCTION MOTORS, type "I," class 8-30-900, form "A," H. P. 30, cycle 60, volts 220.
- 1 3-PHASE INDUCTION MOTOR, type "I," class 10-50-720, form "B," H. P. 50, cycle 60, volts 2080.
- 100,000 FEET NO. 2 B. & S. COPPER WIRE.
- 1 LARGE LOT OF ELECTRICAL FIXTURES AND FITTINGS.
- 2 PELTON WATER WHEELS, 350 H. P. each.

Hoisting
Engine

BUILT FOR THE
Anaconda
Copper Mining
Company
OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

# CATES IRON WORKS

## MINING MACHINERY.

Among Our Great Specialties Are:

### HOISTS.

This is a type of a very strong, well-designed machine, single or double drum.

### SMELTING FURNACES.

Our furnace line includes Lead, Copper, Round, Rectangular, Reverberatory, Cupelling, Wrought Iron, Cast Iron, and all accessories.

### BRUCKNER ROASTERS.

In this line we have equipped some of the most important plants. We furnish all the accessories of a complete installation.

### CONVERTERS.

This specialty is strictly up-to-date, with every possible feature of a perfect plant. We have introduced some very important features in copper converter installations.

### IRON JIGS.

We take special pride in directing attention to a first-class jig shown in this cut.

### TILTING CRADLES.

This small cut will give an idea of the construction of this machine. All the cuts in this ad. made direct from the originals on our shop floors.

## THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 3/4" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : S. K. SNODGRASS, Denver, Colo. (The Windsor.)

Modern Copper Furnace, with Our Patent Water Vaporizing Attachment.

## OUR SPECIALTIES: MILLS AND SMELTERS

FOR THE TREATMENT OF ANY OR ALL KINDS OF ORES.

We design, manufacture, erect and fully equip them, for any desired capacity.

In writing for information, give us analysis or character of ore to be treated, to enable us to intelligently arrive at the proper method.

SPECIAL CATALOGUES on Smelting, Concentration, Amalgamation, Cyanide, Chlorination, Crushing, etc., mailed on application.

### The . . . . Wilfley . . . . Concentrating Table . . . .

The most satisfactory concentrating table now in use.  
It will give better net returns than any other machine.  
It will make a satisfactory saving on the finest slimes or will handle pulp as coarse as 8-mesh to equal advantage.  
The Wilfley Table is made only under the personal supervision of the inventor. It is built right and all possible improvements are embodied in the later machines.  
Send for circulars describing the latest improved table.

## ROOFING COST.

Every builder should consider well the cost of roofing.

There is no economy in a cheap roof, for it is only a question of time until needed repairs double the original cost.

The first cost of P. & B. Ready Roofing may be a trifle higher than other roofings, but the first cost is the end of your roofing investment.

P. & B. Ready Roofing outlasts and outwears all other roofs. Heat, cold, snow, rain, wind, acids, fumes, smokes, or anything else will not injure a P. & B. roof. It lasts as long as the building it covers, and is by far the cheapest roof in the long run.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

# CRUSHERS FOR ASSAYERS.

## SIMPLEX ORE CRUSHER.

### BRAUN'S ORE SAMPLE CRUSHER AND PULVERIZER.

HAND OR POWER.

A machine that crushes and pulverizes at one operation, re-

This is a compact, rapid and effective crusher. Cleaned and operated quickly and easily. All parts renewable. Crushes from two inch to ten mesh. An ideal laboratory

crusher, as the parts are few; and as it is so readily cleaned, there is no danger of salting subsequent samples. Made in two sizes for hand or power. The ore is crushed against the upper jaw and pulverized between the vibratory jaw and the roll. Back motion of roll is prevented by small rolls or chokes. Easily adjusted and operated.

Write for our illustrated circulars of these and other labor-saving devices.

PRACTICAL WORKING TESTS OF ORE BY ALL PROCESSES.

STAMP MILL AND CONCENTRATOR IN OPERATION ON PREMISES.

Thomas Price & Son,  
Assay Office, Sampling Works  
And Chemical Laboratory.

526 Sacramento Street, San Francisco, Cal.

Operator taking courses or horizontal  
angles with BRUNTON'S PAT. POCKET  
MINE TRANSIT.  
If you wished to find the angle be-  
tween two points below the horizontal  
with a sighting compass or an ordinary  
transit, you would first have to set up  
your tripod or staff and then level up  
your instrument. All this takes time.  
If you only wanted to get the angle  
within a degree or so, you could take  
a BRUNTON TRANSIT, and, holding it  
in the position shown, take your  
readings in less time than you can  
take any other instrument. Send for  
descriptive catalogue B to

THE PNEUMATIC CYANIDE PROCESS CO., 306 Boston Bldg., Denver, Colo.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

PATENT SOLICITORS,  
330 MARKET STREET, - SAN FRANCISCO, CAL.  
AND 918 F STREET, N. W., WASHINGTON, D. C.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

# THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

**MAIN BELTING COMPANY,**  
1235-41 Carpenter Street, Philadelphia.  
55-57 Market St., Chicago. 130 Pearl St., Boston.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

## THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its  
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable.  
Will take ore from finest mesh up to 6-mesh without sizing.  
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.  
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD  
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

### The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot. (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tannage) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

THE WETHERILL MAGNETIC SEPARATING PROCESS

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y.

## The Lunkenheimer "Clip" Gate Valve.

Single Disc  
DOUBLE SEATED.

Made with Screw Ends from 1" to 6",  
Flange Ends 2" to 6" sizes.

BEST IN QUALITY.  
LOWEST IN PRICE.  
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of  
gun metal. They are superior to the common, cheap,  
brass valves with which the market is flooded.

### WHY?

BECAUSE they possess all the advantages of a cast iron pipe  
fitting (E bow, Tee, Coupling, Union, etc.) namely—are heavy  
and rigid—not injured by expansion and contraction or rough  
handling in pipe fitting. TAKE PRESSURE FROM EITHER  
END. Body and hub are held together by a steel clip, conse-  
quently always easily taken apart. Joint between body and hub  
made permanent by an imbedded seamless oval copper wire  
washer. If you desire the BEST, STRONGEST and MOST DUR-  
ABLE valve for general purposes on all ordinary pressures,  
use this valve. IT IS A STANDARD FITTING, OF NEAT AP-  
PEARANCE and FULLY WARRANTED TO SATISFY. Made  
also in All Iron for Cyanide and other acids. Specify them and  
order through your dealer. Write for catalog.

## THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested  
by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent Ameri-  
can engine builders, who are good judges of lubricators. Many of these  
have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use,  
or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our  
new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

## THE BRETHERTON HOT BLAST.

APPARATUS FOR PYRITIC SMELTING. It saves fuel, increases capacity of furnace, im-  
proves character of work, does not require a hot top causing volatilization like other inventions, fur-  
nishes pure air heated without cost, can be attached to furnaces already in use, is an all around money  
saver, built and used by practical, successful metallurgists. Write for particulars to

THE BRETHERTON HOT BLAST SMELTING COMPANY, Mining Exchange Building, Denver, Colo.

Most reliable for controlling steam and other  
fluids. Can be reground, if necessary, while valve  
is in position on steam pipe.

## ASSESSMENT NOTICES.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of April, 1901, an assessment (No. 23) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
ALEX. GRANGER, Secretary.  
Office—Room 223 Crocker Building, San Francisco, California.

**EUREKA CONSOLIDATED DRIFT MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of April, 1901, an assessment (No. 30) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. W. DIXON, Secretary.  
Office—214 Pine street, room 31, San Francisco, California.

**NATIONAL CONS. MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of April, 1901, an assessment (No. 14) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 25th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. W. FLEISSNER, Secretary.  
Office—773 Mission St., San Francisco, California.

**OSCEOLA CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of April, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
HOLLAND SMITH, Secretary.  
Office—307 Montgomery street, San Francisco, California.

## THE KLONDIKE OF ARIZONA.

**THE Prescott and Eastern Railroad**

ENTERS AN

Extremely Rich Mining Country.

The opening of this road makes easy of access one of the Richest Gold and Copper Mining Districts in the World. Hundreds of prospectors are turning their attention to this section.

Take the Santa Fe System to Ash Fork, thence via the SANTA FE, PRESCOTT & FREDIX R.R. to Prescott. This latter road also reaches Wickenburg, where is located the great Vulture Gold Mine and where the recent marvelous gold strike was made in the Oro Grande.

For further information and descriptive literature, address F. A. NEWALT, Gen. Frt. & Passenger, PRESCOTT, ARIZ.

## DELINQUENT SALE NOTICE.

# THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact.

RAWHIDE GOLD MINING COMPANY,  
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.  
Yours truly,  
W. A. NEVILLS, President.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best.

AMADOR CITY, CAL., Feb. 18, 1897.  
Yours very truly,  
THE CONS. SOUTH SPRING HILL G. M. CO.  
By JOHN R. TREGLOAN, Superintendent.

## The Three Stars Mine, Ophir, Placer County, Cal.

The Three Stars mine is one of the oldest quartz discoveries in Placer county—not later than the third. It had on it one of the first quartz mills erected in California—in 1854. Massive outcrops of quartz stood 15 feet high out of the soil into which the country rock formation had decomposed, and showing gold the early miners put up a mill. The venture was not successful, and appears to have been abandoned without any underground work except a couple of shallow pits in the outcrop.

For a long time after this early attempt the miners left the quartz alone and confined their activities to the rich, shallow placers of the flat ravines leading up to the great vein. In the early '70s when the quartz mining of the adjacent town of Ophir was at its height, and its mines—notably the St. Patrick—were the basis of more or less stock manipulation in the San Francisco exchanges, an old German named Kittler located the abandoned ledge and sinking half a dozen shallow shafts, the deepest only 90 feet, from another part of the ledge than the scene of the first working, took out a small fortune. Shortly afterward dying, his heirs abandoned the mine. In 1879 it was again located by four miners—the Peardon brothers and the Hawkens brothers. These men had no capital but their ability to work. They sunk a new shaft, found gold almost from the start, crushed a little of the ore in a custom mill and with the returns from it bought an old mill, set it up on the mine and commenced to pound out of the rock a comfortable living and the beginning of a modest fortune. Gradually their operations extended. Other shafts were sunk, the first one was deepened to 360 feet, a substantial steam hoist was erected and by 1885 they had taken out and expended in their living and in improvements on the mine about \$70,000.

Then the fortune of the mine turned. First one of the Hawkens brothers had his life crushed out of him

by a cave in the mine where at the time he was working alone. Later their costly hoisting works were destroyed by fire. Again, a few months after, the two Peardon brothers and the other Hawkens brother were smothered to death, the shaft building catching fire while they were working on the 300-foot level down another shaft.

For several years again the mine lay closed. In 1894, having been acquired by the immediate grantors of the present company, attempts were made to develop it with insufficient capital. The surface had been robbed and it was necessary to gain depth to

open new ground. The capital employed sufficed to construct some excellent surface improvements, to clean out and deepen the old corkscrew incline shaft over which the hoisting works had been burned, and to start the North Star vertical shaft.

Ultimately, in 1897, the present owner, the Three Stars Mining Co., bought it and with ample capital at its command has since then been "making the mine." The illustrations show the character of the surface betterments. The site of the mine is on the summit of the first bench rise in the foothills from the Sacramento valley, about 500 feet elevation above tide water.

The soil and climate and abundant water for irrigation make possible the touch of landscape art that has beautified at a trifle of cost the roughness and raggedness of a working mine. The buildings for offices and employes are conveniently disposed on a broad roadway. The mine hoists are substantial and perfectly appointed structures. The Morning Star vertical shaft is down 1100 feet. The 300, 500 and 700-foot levels have been run out, the latter for 1700 feet, blocking out stopes. The Belmont shaft has been put down to 541 feet, with 500 feet of drifting on each of the 300 and 500-foot levels. On the Almont, a parallel ledge, there is a vertical shaft now down 524 feet, with stations cut at 300, 400 and 500 feet. So far there has been no stoping of ore, the dumps coming from the levels and other openings. Now that the ground is opened up, insuring the ore supply, the site is being prepared for a 40-stamp mill, twenty of which are expected to be put in this season.

The country rock formation in which the ledge strikes generally north and south is grano-diorite. The contact line with amphibolite is about a quarter of a mile north and courses at almost right angles to the lode strike. The dip of the ledge is about 80° to the east. The ore bodies are lenticular, wide in places, narrow in others. The main system of veins of the district strikes is, roughly, parallel—northwest and southeast—to the contact described.

THE making of the cities of the Great Lakes into ocean ports is of considerable benefit to the miners of the Rocky Mountain States. The surplus production of metal of these States can be laid down at the seaports of Europe at practically no greater total cost of transportation than now is the rail cost to the Atlantic coast alone. The lead producing industry is in need of this help to larger profits and should take advantage of it.

THE mine owners at Reno, Nevada, propose to form an association to generally foster and be protective to the mining industry. Only within the last few weeks has the mining industry of this locality shown promise of future magnitude, yet the early action toward organization is to be commended. Care should be taken by the organizers to keep the mutually protective character of their organization to the front. The organization should not permit itself to become a brass band to attract the outside investor. Good mines advertise themselves and bring investors. If half the local papers state regarding the local mining is fact, the mines around Reno will make themselves without the assistance of outside capital. For the future of both Reno and the mines, they are the better off for developing within and from themselves. The mining districts that excuse lack of development by the absence of outside capital are not as inviting to outside capital as the districts in which the mines themselves are capital.

THE Canadian Government, it is reported, has decided to pay a bounty on lead refined in Canada of \$5 per ton, not exceeding \$100,000 annually. In direct effect this does not seem very much, but indirectly it cannot fail to influence the price of lead in the foreign market. The establishment of the refinery in British Columbia will not only give the direct bounty of \$5 a ton, but it will give as well a large indirect bounty, amounting to the freight on the ore or on crude lead from the mines to San Francisco and the return freight on the lead from San Francisco to Canada. The lead which does not get the direct Government bounty will get the indirect bounty of freight money saved, and the annual production can easily be made to far outrun the 20,000 tons annually the bounty would provide for. Conditions have been such without the refining that the lead from the mine was worth slightly less than nothing, as a producer explained it; but it had to be separated from the silver by refining. With the refinery, the lead will at least be worth the bounty, and many Canadian mines now inoperative will be able to resume with a profit margin. The effect of the increase in production can reasonably be counted on to reduce the Lon-

don price, and to reduce the return from the surplus United States production marketed abroad. Ultimately the sum total of this will be distributed to the mine producers of the United States in lowered prices, unless the American Smelting & Refining Company decides to pay it, just as it pays the freight on the lead from the refineries in Colorado to New York. It is to be hoped the economies of consolidation will permit it to do so.

## Leadville's Opportunity.

This paper last week pointed out to Leadville the real weak point in her economy as a city dependent on the mining industry, and suggested the remedy. Leadville has more than the ordinary run of good fortune. The Supreme Court of Colorado has this week decided that the city of Leadville owns her streets and roadways in fee—that the minerals beneath the surface belong to it as well as the mere right of use of the surface. The telegrams state that it is estimated the back royalties that Leadville will receive under the decision will amount to \$2,000,000. Probably this large sum is more or less imaginative, but the amount should be considerable enough to provide for such public utilities as water, light, street paving and schools, and for the ownership of the spur tracks from the mines to the main lines of railroad or to the treatment works. The decision has made it possible for Leadville to do this and the opportunity should not be lost. The suggestion of this paper as to the local ownership of the mine spur branches did not have in view public ownership as is now possible, but contemplated merely ownership by citizens and residents of Leadville, thus insuring a local distribution of the local transportation earnings. It is the fact that is essential, however, and the distribution of the earnings is more certain in local public ownership than in local private ownership.

Leadville is practically in the position of having forced on her the association of miners and mining interests that this paper has advised to be undertaken voluntarily. Without the responsibility of detail in the mining, she will have some of its earnings—in the aggregate a larger proportion than before. At the same time Leadville will have the responsibility of ownership. The ores beneath the streets have got to be mined to benefit her. Fairness and moderation in the amount of royalties, and disposition of them in providing such public utilities that the miners shall indirectly receive the benefit of the expenditure, are essential business methods of the novel proposition. As opposed to the reorganization of the mining industry that is being undertaken by business interests which did not make the industry, Leadville has an opportunity to initiate reorganization of her part of the industry from the end of her interest in it. The utility she makes of her opportunity is worth watching.

FROM trade and consular reports the situation as regards copper production would seem to be favorable, and indicate that ordinary trade conditions of short supply and steadily increasing consumption will maintain profit-earning sale prices for the metal for a considerable period in advance of the present time. Despite the stimulation of nearly doubled prices for over two years countries other than the United States and Mexico have not increased production sufficient to supply their own increased needs. Some of the largest consumers have reduced production. The difficulty with them is that they have not the raw material, the ores. Copper mines, therefore, seem commercially safe propositions. Investors, however, should not discount the present prices as if they were permanently fixed when it comes to opening mines. An average of quite low grade ore, yielding a small per cent of copper, can be made to pay with copper at the present prices, but any reduction of prices will sweep away small operative profit margins. Treatment costs of low grade ore are the same as the treatment costs of high grade. It takes a definite number of pounds of copper at present prices to pay these charges. With lowered prices it will take proportionally more pounds of the copper. The mine requires a margin in metal content to insure that it shall successfully stand lowered sale prices. A low grade gold mine is distinctly a different proposition from a low grade copper mine. In the former there is only the risk of the mine to be carried by the operator, for the gold is always worth

\$20.07 an ounce, in the latter he has to carry as well the risk of the market price. The safety margin in the metal content of the mine should be much larger.

A SUGGESTION has been made by a mining engineer that he would contribute liberally to the republication of a number of the special technical papers prepared by experts for the California State Mineralogist Reports. The State should republish them without becoming an object of charity. The papers were prepared in the first instance to be of service to the mining industry. A most convincing tribute to the successful accomplishment of their purpose is the continued demand for them even after they are long out of print. In many instances there were only a small number of copies printed separate from the annual reports, but the supply of the latter has also been exhausted. It is suggested that the technical requirements of the law could be complied with and the papers be republished with credit to the Bureau and advantage to the public. While the original papers are still standard as authority in many lines, the writers would without doubt be willing to bring them down to date at the request of the State Mining Bureau, which could then publish them as new matter. There is no similar set of technical papers published elsewhere, and as official public work the State should not miss the enviable distinction incident on their republication. If the matter of expense stands in the way, their cost could be recovered from their sale.

THE depression in the price of crude oil at the wells in the Bakersfield district in California to 25 cents and less per barrel has done what no end of warning writing on overcapitalization of expectations or danger of outright fraud by promoters could accomplish. It has checked the flotation of oil companies for the money of investors rather than for the oil in the ground, and will hold up some of the needless waste of capital in sinking wells where by no possibility can there be any oil. The condition of unprofitable prices to those who have producing wells is not agreeable, but that is a temporary condition. Profit earning is postponed—that is all. The wells consume nothing when capped tight and meanwhile consumption has an opportunity to catch up with production. The senseless and wasteful speculative exploitation is ended for a longer period than the tie-up of profits. In the enforced rest the companies and investors have an opportunity to take stock, not of paper certificates, but of petroleum, actual and possible, and eliminate some of the unnecessary expenses. The industry as a business will have a better future for the medicine of low sale prices of product that it is taking now.

TWO PRACTICAL TREATISES are very much needed, possibly three. One on mine timbering, the best treatise on this subject, the contribution of Mr. W. H. Storms to the California State Mining Bureau, is out of print. The second one is on mine tunneling or mine adit construction. There are two or three good works on railroad tunnels and large permanent constructions, but nothing on the construction of the smaller mine openings, largely for temporary use. Much material properly part of such a work is published incidental to general mining subjects. If it were all compiled and brought together, so that costs and conditions could be compared, this data would make an excellent textbook for the student and reference work for the mine superintendent and foreman. The third work is one on concentration. Ore dressing to-day is much in advance of the ore dressing of twenty-five years ago. Inventors and the descriptions of sellers of concentrating machinery give much information, but such publications, excellent as they are, are not what the student requires.

NO TITLE can be obtained to Alaska coal lands as such through the failure of Congress to make any provision for township surveys. It provided for the extension of the statutes regulating the obtaining of patents for these lands, but leaves the statute inoperative. It would seem as if the conditions are such in Alaska that the old land office practice of permitting deposits by settlers for a survey should be revived. Restrictions could be attached that would prevent the abuse that grew up in the States through the law. The International Mining Congress at Boise could consider this matter.

## Concentrates.

THE commercial source of most of the precious opals is now Australia.

RECENT experiments in wireless telegraphy have made successful transmission 103 and 134 miles.

A TUNNEL 8 feet wide by 7 feet high can frequently be constructed as cheaply as one in the same rock 4 feet wide by 6½ feet high.

DIAMONDS for drilling have increased in value from \$7.50 to \$70 a carat at the present time, and the price, it is believed, will continue rising.

IRON readily amalgamates in the presence of sodium amalgam. Battery amalgam has been taken out containing as much as 50% of iron.

ONE-SIXTH of an ounce of quicksilver per ton of ore is the ordinary loss to be anticipated. Greater losses will occur with partly refractory ore.

NAILS are so cheap and the value of workmen's time so high that it is unprofitable to straighten a bent nail or to stop work to pick up one dropped.

IN tributing, as it is understood in mining, a mine or a portion of a mine is leased on a return in royalty. It is a good method of working applied to a mine with irregular ore bodies.

THE decomposition of some Portland cements in sea water is said to be due to free lime in the cement, which uniting with sulphates in the sea water made a destructive increase in volume.

IF the percentage of sulphurets in an ore is not more than ten it is preferable to stamp sufficiently fine for amalgamating plates and belt concentrators at once, on the score of economy and simplicity.

THE loss of gold in roasting ores containing tellurium, it is now claimed, is not by volatilization, but by the gold-tellurium compound becoming fluid, sinking through the ore and entering into the furnace bottom.

THE maximum practical speed of stamps with 8-inch drop is about 94 per minute; with a 7-inch drop it is 100, but in actual practice not more than 96 or 97 should be allowed. With a 6-inch drop the maximum number of drops is 110.

A FIELD note book for surveyors is now made with the right-hand page ruled in concentric circles and radii. It is designed for use in stadia surveying, and facilitates the sketching in the field of the points and lines of a topography.

VERD ANTIQUE MARBLE is a mixture of serpentine with limestone, dolomite or magnesite. It is not as hard as marble and takes a high polish. It is used in the arts, but not extensively. The Oriental verd antique is a green porphyry.

COPPER ISLAND is a small sealing island in Bering sea, a Russian possession. It is noted for the amount of float copper and copper ores found on it. There has been no attempt made to exploit the deposits, the island being a sealing reservation of the Russian Cabinet.

IN suits brought against the city of Greater New York for damages due to the pumping of the Brooklyn water supply lowering the ground water level in their adjacent lands, the decisions gave small sums as damages to the complainants, but sustained the right of action.

CRIPPLE CREEK DISTRICT, COLO., has the largest gold production of any single district in the United States. Next to Cripple Creek is the Deadwood district, S. D. The production of the former is almost entirely from high-grade ores; of the latter from low-grade ores.

TUNDRA, referred to in descriptions of Alaska and Siberia, is the descriptive name applied to the low plains bordering the coast or lower courses of the large rivers. These plains, perpetually frozen below the surface, in the summer are swamps covered with mosses and low Arctic bushes and grasses.

THE U. S. Circuit Court at San Francisco, by dismissing the suits against the locators of Cape Nome claims, where the contention was that the locators were not citizens, has again affirmed the rule that the location of a mining claim by aliens cannot be attacked in a suit between private parties.

REINFORCED concrete is a combination of steel or iron and concrete. The metal is imbedded in the concrete so as to give the latter the support of its tensional strength and at the same time utilize the compressive strength of the concrete. The combination practically increases the strength of the concrete a hundred times.

THE strength, weight, proportions, supporting power, speed and power required for a flying machine can all be approximately calculated. The mathematics of flying have been considerably evolved and the subject is within engineering computation. Briefly, what has to be done to fly is now known. There remains to do it.

IN a well regulated stamp mill there should be two water tanks, one always overflowing and furnishing a constant pressure, for the stamp batteries and hydraulic sizers, and a second tank fed by the overflow from the first, which supplies the vanners and other mill uses, where constant head is not necessary for regulation.

THE Russian Government has finally, after three years of consideration, granted the Russo-Chinese bank and its branches the right to buy gold dust direct from

the producer. The object is to secure the gold of what are termed free miners, Russian and Chinese who mine without authority and who to avoid confiscation of the gold have heretofore sold it to Chinese buyers who smuggled it out of the country.

THE location of a tract of public land as a petroleum claim, where there is no prior discovery of the oil, does not operate to prevent any one going on the land, drilling for oil, and, finding it by drilling, then locating over the first location. The only safe way to hold an oil location where there is no seepage is to go to drilling on it. No one is likely to chance overcoming the lead of the start of the first drill hole.

THE average cost of diamond drill boring in Victoria, of deep lava-covered placer channels, is from \$1.80 to \$2.90 a foot. The cost of drilling with the calyx drill in coal-bearing formations, dependent on the hole drilled, from 40 cents to \$1.20 a foot. Boring with hand drills in unconsolidated formations, from 40 cents, 100 feet deep, to 85 cents a foot, 350 feet deep. With heavy drift of boulders as much as \$1.50 to \$1.60 a foot.

THE Nome beach placers are the auriferous stream gravels of an old river channel, probably Anvil creek in this case, brought within reach of sea action by subsidence of the region. It is possible, but not probable, that there has been a recent uplift of the once submerged gravels. Such gold as was found at Nome does not float. It may have been moved by wave action a short distance from its original point of deposit and it is certain that there has been a sea concentration of the original stream formed deposit.

THE sulphide ores of the principal lodes of the Kalgoolie district in West Australia are composed of a schistose gneiss with a varying proportion of silica and lime, containing tellurides of gold, silver and mercury associated with pyrite. The latter is not rich in gold and the quantity present is not an index of gold value. The tellurides are varying mixtures of several tellurium minerals. The ores vary in some degree from nearly every lode and the differences seem to affect treatment methods, so that no one system has yet been discovered capable of uniform results with all of them.

IN cleaning plates of a stamp battery, a whisk broom cut down, to make it stiff and strong, should be used, and the plate should have every bit of surface brushed hard till the amalgam is loosened. To remove the amalgam, brush from the top of the plate downward to the lower portion and remove the excess of surface amalgam there. A thin coating will remain on the plates as the foundation for further accumulation. Acids should not be used on the plates at all. Cyanide of potassium in weak solution, only with heavy concentrates, and weak lye solution when there is grease on the plates.

A SOURCE of the frequent difference between the average milling returns per ton, operating with a few stamps, and the lowered average returns when a larger stamp plant is used is the lower grade of ore milled. With the few stamps higher grade ore only is milled. With the larger quantity the selecting is not possible, for the quantity of the higher grade is not there. Consequently, everything that is ore going into the mill the average ton return is reduced. The mine is not failing to hold up nor the milling neither. It is simply the working of grades of ore so comparatively poor that they were passed when only the few stamps had to be supplied.

IF, in staking off two adjoining claims on the same ledge, more length of ledge on one or both is included, than will make 1500 linear feet for each claim, so that on remeasuring according to the calls of the location notices the ends of the claims no longer adjoin, the length of lode that was improperly included in the original staking is locatable by any one discovering it. If the assessment work for both of the original claims was performed on one of them on the theory that they were contiguous, and it proves subsequently that they are not contiguous, the one on which no work was performed would seem to be relocatable by third parties discovering that it was not in reality contiguous to the one on which work was done.

LONG-CONTINUED HEATING at a dull red color of low carbon or soft steel, where the percentage of carbon is as low as .2%, causes a granulation or coarse crystallization of the metal. It may become quite brittle. This is probably the cause of some sheet steel for pipes breaking under hammer blows. The rolling and annealing undoubtedly add something to this tendency to crystallization. Sometimes the effects of the rolling and annealing develop what is called scale—an envelope or several envelopes of coarsely crystallized brittle steel over a core of steel of perfect quality. The shells of brittle steel fracture and scale off from bending. Heating to 900° for a short time, cooling rapidly to 630° and then cooling slowly will remove the defect.

THE exhibit of mining made at the Buffalo Exposition under the supervision of Dr. David T. Day of the U. S. Geological Survey has been devised in a system to aid the visitor with the least possible effort to get an intelligent comprehension of the art of mining. First, all the natural mineral substances are shown in specimens just as they come from the earth. Next, the conditions of underground occurrence are shown with illustrations of methods and appliances employed in their removal. Finally the commercial forms the minerals take illustrated by the industries of ore and metal treatment.

Specially with the precious metals the physical appearances and forms taken according to the natural source or special form of treatment employed are shown. Maps are distributed showing the mineral-bearing localities, and there are grouped local exhibits. Machines for extracting metals and ores are shown historically. And finally there is a large library of the literature of mining.

THE B. & S. wire gauge referred to in describing electric transmission lines is more intelligently referred to as the American wire gauge. It is not the same as the American gauge for sheet metal, so that the numbers do not refer to diameters equal to the thicknesses of the same numbers in sheet metal. The cross section can be determined approximately for any number of gauge if the cross section of one number is given. The numbers increase as the gauge diminishes. By adding 3 to any gauge number of known cross section area, the resulting number is the gauge number for a wire of half the cross section of the first. Subtracting 3 in the same way gives the gauge number of a wire with twice the cross section. The diameter of a No. 10 B. & S. wire is approximately one-tenth of an inch.

GEOLOGISTS coming up against new phenomena or new views of old phenomena have the habit of coining new words, to take the place of old ones, the rough edges of which have become worn off by use, and which the geologists think do not express their new ideas with sufficient definiteness to be understood among themselves. If it does nothing more than freshen up their speech the new word serves a useful purpose to them. It is of little consequence to the people who use the material they gather what the word is. "Ionization" is the newest word for the idea that has become familiar as "chemical affinity." "Metasomatism" is an even newer expression for the idea that has only recently been appreciated under the term "replacement." It is a point of honor for a geologist to understand the meaning of newly-born technical expressions, he must perforce recognize his own, but the miners would apprehend better if an announcement of the new word was introduced with its exact meaning defined in plain, every-day language. It is embarrassing to admit the ignorance implied in asking for the meaning.

WHERE very exact measurement in a survey is required over rough hill or mountain slopes, two methods are available. The transit can be employed to line in stakes, and tack heads on them so that a tape length can be stretched free between two points. The differences of elevation between successive stakes are then taken with a level. A steel tape compared with a standard is used to measure between the tack-head centers. A spring balance keeps the tension constant. The temperature is recorded. The measured distances between the successive tack centers are corrected for temperature. The base of each triangle is then computed, using the distance between tack centers as the hypotenuse and the level differences as the perpendicular. The sum of the bases finally added gives the horizontal distance between the terminal points. The second method is simpler: The stakes and tacks are centered as before, but sufficiently close together to permit of horizontal measurement being made from a plumb line suspended over the lower point. A tripod with six or seven-foot legs is made and a plumb secured to it. This is set up over the tack centers, successively; a hand reflecting level is used to level the tape to the proper point on plumb line, and the successive horizontal distances are measured, corrected for temperature and added. The latter method will make ordinary mine connections.

UNDER the mining laws of West Australia, any person may mark off as a gold mining lease an area of twenty-four acres, and, after certain preliminaries have been complied with, the Minister of Mines grants the lease, which provides, on the face of it, that the lessee is given the right to all the gold found within its boundaries, being perpendicular, for a term of twenty-one years, with an absolute right of renewal. The main conditions are that the lessee shall not use, or occupy, or permit the said land to be used or occupied for other than bona fide mining purposes, or sites for offices, or dwellings for the persons employed in or about the mine; that an annual rent of £1 (\$5) per acre shall be paid to the Crown, and that one man for every six acres shall be employed in the construction of the works, or in mining operations on or under the said land during the usual hours of labor, being eight hours on every working day (not being a Bank holiday), except Saturday, when only four hours' work need be done, and except during such period of exemption from work as the Minister or Warden may grant. The holder of a gold mining lease is entitled at any time to exemption from labor on the property for one month on satisfying the Warden (who has power to grant that period) by evidence on oath in open court of the actual existence of any of the following causes in reference to the land: Want of capital after a fair sum shall have been expended. That time is required for erection of machinery. The influx or scarcity of water. Scarcity of labor. The collapse of a working shaft. That the mine is for some other cause unworkable. That the owner or owners require to be absent for some sufficient reason from the locality, or is or are unable, by reason of sickness or other sufficient cause, to work the mine. That the title to the mine is in dispute. That the owners of two or more adjacent leases desire to concentrate the labor compulsory on such leases on one of such leases, and to obtain suspension of labor for the other leases.

### Auriferous Iron Sands of New Zealand.\*

Auriferous iron sands (chiefly magnetic oxide) are, for the most part, confined to the west, south and southeast coasts of the middle island of New Zealand, commonly known as the south island.

The titanic iron sands of the west coast of the north island, though mixed with magnetite, are not usually gold-bearing, and south of Auckland have not been ascertained to contain gold in sufficient quantity to pay for working such deposits. For the most part these sands have been derived from volcanic rocks of young Tertiary date, associated with which, except on the western flanks of Mount Egmont, there are no lodes carrying gold.

On the west coast of the south island the sea beaches, formed of material of moderate fineness of grain for the most part, show the presence of magnetic iron sands, and often such sands for a considerable part of the total material of the beach between high and low water mark. Such sands are at almost all places auriferous, and for the past thirty years have been worked for gold. At first these deposits were extremely rich, and were worked again and again, as often as the material was acted upon by a heavy surf during storms, or rearranged more slowly by the ordinary action of the tides. Often the auriferous sands would be covered by a variable depth of grey quartz sand, which, if not too deep, would be removed to reach the auriferous layer, but as frequently this would appear at the surface, varying from a few inches or a mere skimming to 1 foot or more in thickness. Such deposits, when formed, were treated as rapidly as possible, or, at all events, removed beyond the action of the tide, as they are apt to be suddenly swept away by a change in the direction of the wind or by a varying force or direction of the tide and sea currents. Gradually, in the course of years, these beach deposits became less auriferous.

Usually, where magnetic iron sands are found on the beach, deposits of the same kind, now no longer acted upon by the tide, are present on the higher grounds inland, or lie buried under grey sands between tide mark and the foot of the first terrace. These beach leads have been a great source of gold at many parts on the west coast of the south island. At many places, near the mouths of rivers and large creeks, considerable areas have yet to be worked. This first horizon above or inland of tide mark has deposits of iron sand in all favorable situations along the west and south coasts of the island, and these are notably developed near the mouths of the larger rivers. Usually they have proved very rich in gold, and but for difficulties such as have been alluded to most of them had already been worked out. At higher levels successive terraces of auriferous iron sands are met with.

On Addison's Flat and at Charleston the iron sand deposits are developed on a most extensive scale, and have yielded—and still do—great quantities of gold. At both places further oxidation of the magnetite has taken place, and rusty-colored iron sand cements are the result. This fact has entailed an enormous loss of gold to the claim holders working the cement, as the gold coated with iron oxide escapes being caught by the means employed for that purpose, and, finding its way into the tailing channels and streams, a part of such escaped gold is again recovered by various contrivances placed so as to intercept it, and a part carried to the seaboard tends to enrich the black sand deposits within tide mark. Between Charleston and Brighton these deposits rise to a height of 600 feet above the sea.

The great richness in gold of these sands enabled them to be worked with profit when the means employed were both costly and of a rude description. At many places the yield was phenomenal, and black sand claims are still in favor. Many deposits are rich only in particular parts, or are poor generally.

The auriferous iron sands of the west coast comprise the black sand beaches at low levels along the present coast line. Generally they are limited to a terrace escarpment of the more elevated lands on the inward side, which runs nearly parallel to the coast line, but near the mouths of the larger rivers they recede inland and become less marked, and here the deposits of the littoral zone blend with those brought down by the rivers.

By the continued action of the surf the heavier materials—gold and black sand—are associated together, and there, between high and low water mark, accumulate to what appears as a stratum of black sand, which, varying in thickness, may be either exposed at the surface or buried under a variable thickness of ordinary grey sand. The gold usually is very fine, and special means for saving and collecting the same had to be devised. Between the sand hills and foot of the terrace escarpment, where present, there is usually a swampy depression, on the inland edge of which, so far as it could be worked seawards, gold under similar conditions to that on the beach and under the sand hills has occurred, but

Hoisting Works of Morning Star Shaft, Three Stars Mine, Ophir, Placer Co., Cal.

Machine Shop of Three Stars Mine, Ophir, Placer Co., Cal.

(See front page.)

the water at present prevents this being further worked without the application of special dredging and pumping appliances.

Along the different lines that have been worked these deposits are usually spoken of as "black sand leads," but to me the term is misleading, as I am well satisfied that a more or less continuous stratum of gold-bearing sand will be found from the foot of the cliffs to the present beach, or, where these are absent, from the point where the fluvial deposits of the rivers give place to the deposits of the littoral zone.

The source of the black sand gold within high water mark, and the lower black sand leads parallel thereto, is supposed to be mainly the fine gold carried along the beds of the larger rivers and distributed to the different beaches by the action of the sea. That gold in this manner does reach the coast line, and is so distributed, is not to be doubted, and as an instance in illustration the Arahura river may be cited, the beaches of which for the first 10 miles up the valley were rich in gold. The New river also is proof of the same thing. However, in the one case—to wit, the Arahura—the gold may have been directly derived from the rocks in situ. In the other case, that of the New river, it has been derived from pre-existing auriferous gravels. But, apart from such considerations, to refer the whole of the beach gold to the golden sands carried along the beds of the rivers to the sea implies a greater richness of these than seems to be borne out by the facts. It is more probable that much of the gold found must be referred to the sea cutting away and reassembling older deposits of the more elevated black sand leads, and the auriferous gravels of older Pliocene or Miocene

date. Where the high-level marine gravels are absent—as, for instance, between the mouths of the Hokitika and Totara rivers—and glacier deposits are present, to these latter must be referred no inconsiderable part of the gold found on the black sand beaches.

Like the littoral deposits already described, marine gravels containing black sand leads are developed parallel or approximately parallel, to the coast line. They are first distinctly met with at the eastern edge of the Big Paddock in the Houhou lead, at the bottom of the series of gravels forming the terrace flat to the westward.

On Ballarat hill the lead was fully developed. As far back as workings have been carried to the eastward, on Ballarat hill, beds of black sand, partly oxidized and cemented, are found interbedded with the coarser gravels, thus indicating the marine character of the beds.

ELECTRIC EYEGLASSES, a German invention, are claimed to restore dimmed or darkened vision. They are about the same size as an ordinary pair of spectacles, but the frame is made of thin layers of copper and zinc. These metal sides are moistened with some dilute acid, and an electric current is thus caused to flow through the eye nerves, resulting in better vision.

THE total domestic exports of the United States in the nine months ending with March were \$1,120,480,673, while the exportation of British and Irish produce in the same period was \$1,060,346,214, showing the exports of the United States to be \$60,000,000 greater than those of the United Kingdom for the same period.

## Electricity in Mountain Mines.\*

By F. W. BRADY.

The first requirement in making such mining installations is to get reliable data of the capacity of the water power. Generally the plants installed far exceed the power available to drive them. The report of the constructing engineer should be very elaborate, not only regarding the water power, but also conditions in the mine, the methods of transportation, special requirements in design of apparatus, maximum weight of parts and dimensions, the topography of the district for pipe lines, transmission lines, etc. As mountain streams are so variable, it requires measurements for a period of several years to get any reliable basis to work on. From the very nature of the case, such installations are far from the base of supplies and in locations often where little or no mechanical or electrical work had ever been previously attempted. Even at best, an unlimited number of schemes and devices must be worked out on the spot to facilitate the transportation, construction and operation of the plant.

The plant of the American Nettie gold mine, of Ouray, Colo., is a good sample of an installation in which all the mine machinery and most of the materials for the transmission line were transported from the railway over a burro trail. The source of power for the plant is the Uncompahgre river, a dashing mountain stream fed by springs and heavy snows from a very large area of an intensely rugged range. There is a considerable variation in the volume of the flow of the stream, the lowest being in February and March, when there is the least thaw and the streams are frozen. The flow at this time was found to be 960 cubic feet per minute. The river also has a daily variation, being lowest about 3 o'clock A. M., and highest in the evening. The flow is also cut off temporarily at times by big snow slides which close the stream until it can melt through.

The highest water is in early July, when the first hot days in this region bring down all the snow from the immediate foothills. No measure was secured of this flood stage. A 30-foot log dam, a penstock 18 feet high by 6 feet square, and 400 feet of 4x5-foot flume with sand box and screens were erected in the winter during the lowest stage of water. Ten feet of the penstock was built of 2x6-inch plank laid flatwise in tar and spiked together; upper 8 feet of 2x4-inch. Four 1-inch anchor bolts extended through the entire height. The pipe line was 1400 feet long and 30 inches in diameter and made of No. 14 B. & S. steel. These plates as received were 36x96 inches, and weighed from sixty-five to seventy pounds each. These were punched, rolled and riveted and six sheets put together, the horizontal seams being double, and the vertical ones single riveted and making sections 17½ feet long. These sections were then dipped in a hot bath of maltha and coal tar and thoroughly coated inside and out. Ten barrels of the compound were required for the job. After drying they were hauled to the grade and put together as follows: beginning at the wheel end the sections were united by a 6-inch telescope joint. The larger ends of the sections were expanded by sprinkling with gasoline oil and firing. This process also softened the compound and aided in making a tight joint. The sections were forced together by using a set of triple blocks on each side, having two men operating each set of blocks and a fifth man to guide the end of the pipe and at the same time jar it to a tight fit by using a sledge against a block of wood on the end of the pipe. As line was straight, and the fall not over 75 feet, this style of joint proved very effective. The wheel opening being 24 inches, a reducing section was necessary at this end. A 14-inch manhole and a hose connection was also placed in this section. The connection at the penstock was enlarged from 30 to 36 inches to allow an easy entrance for the water.

A 3-inch air valve was inserted in the pipe on the highest vertical bend. Most of the pipe was laid on an elevated grade. It crossed the stream from which the water was taken, and required two special bridges for this transfer. Practically the whole of the pipe was therefore subject to the extreme changes of temperature. Such a pipe should be kept full of water to prevent undue expansion and contraction. If not, there will be excessive leakage.

The building erected to house the machinery was a two-story frame structure 30x32 feet, the second story being used as a residence for the operator. The plan was made to accommodate duplicate generators to be operated by a 20-inch double-discharge Leffel turbine with horizontal shaft and friction-clutch pulleys, 28 inches diameter by 13 inches face, one for each unit. The turbine with its two 12-inch by 4-foot draft tubes was set on foundations as directed by the makers.

The foundations for machinery and building were made of rock and cement. However, the "I" beams composing the longitudinal part of the frame were deflected sidewise by the water pressure, and it became necessary to bring them into line again by the use of jackscrews, and then to extend the concrete

foundations to the top of the beams. The wheel was fitted with a Wood governor, which worked very well for small variations of load; but for large ones like that caused by the starting of a compressor, it was of no value in this plant. When such changes were to be made, the operator was notified by telephone, and hand regulation was applied to the wheel. Without this hand regulation, the incandescent lights would be destroyed when a heavy load was thrown off. The plant was operated continuously.

The switchboard was made of kiln-dried maple, and arranged for the duplicate 60 K. W. 500-volt compound generators.

The line extended over a very rough section of country, and was rather difficult both to locate and to construct. There were several zigzags so as to cross the cliffs where it was possible for men to approach the route. Trees were used for poles wherever possible. Other poles were cut from the nearest timber, and rolled or dragged into position, and set in holes blasted from the rocks by the use of dynamite. Heavy guys and double crossarms were frequently used along the line. The wire, 000 B. & S. bare copper, was received on wooden spools in the lengths of 1000 feet (500 pounds). It was desired to take about one-third of these coils to the mine and run them out from that end. As 500 pounds was too heavy for one mule to carry, and as it was preferable not to cut the wire, they were transported as follows: The wooden spools were removed from the wire, and the coils separated into four parts with connecting links. Two of these were placed on the pack saddle of one mule, one on each side, so as to balance. The other two were similarly placed on a second mule, the animals being connected by the 10 or 15 feet of wire between the two loads. The outfit could then move single file up the trail. At the mine the four sections were placed on the spools, which served as reels when placed on a spindle anchored to a tree. The end of the wire was passed through a friction clutch made of two pieces of plank bolted together, and then guided down the route of the poles by several men. A second section was then spliced and soldered to the first, and the operation continued until 3000 feet of wire was drawn out, 1500 feet on each side. Other sections were then drawn out by men and horses from various locations along the route, which could be most easily reached, for the total length of 4400 feet. The completed joints were made Western Union style and soldered by pouring the molten solder over them. The wire was laid up and drawn into position in the usual manner. Special railway insulators were used to anchor the wire on the tops of high bluffs. Care should be taken in such rough country to set the cross-arms on the poles so that the grooves of the insulators will be in line with the wire, also that such construction be made extra good and strong.

The mine consisted of a series of tunnels opening in the face of quartzite ledges on the mountain side at an elevation of about 9500 feet. These tunnels were of irregular size, varying from that of a rectangle less than 4x6 inches to very large rooms or cavities. The mine was practically dry, though some water accumulated in two or three places.

The mine equipment besides incandescent lights in the tunnels and buildings was as follows: one 12x12 inch high altitude type of compressor, a blower, and a hoist. The machines were housed in good sized rooms made of boards and corrugated iron. It is necessary to cover such machines with a tight and strong roof to prevent small pieces of rock from dropping into the working parts. A substantial room for each machine is advisable, which can be locked to prevent meddling by employes other than the ones directly in charge.

The compressor was set in an offset from the main tunnel about 1000 feet from the entrance, and near the work to be done. This method of location is important, as it saves power, cost of installation, and avoids loss by leakage of pipes. No. 0 B. & S. insulated wire was used in this tunnel. The compressor was operated by a 35 K. W. shunt motor geared on the same bed plate. The air receiver, 30 inches in diameter by 10 feet, was located about 20 feet from the compressor. The jackets of the air cylinders and the intercooler were supplied with water from two 735-gallon tanks located about 100 feet from the compressor. A centrifugal pump was driven by belt from the intermediate shaft of the machine, and forced the circulation of the water through suitable piping. From ten to eighteen gallons of water per minute were passed through the compressor, and kept it in fair condition. The speed of the compressor varied from 150 to 200 revolutions per minute, and when operating two Ingersoll-Sargent drills and furnishing blast for one forge at a pressure from sixty to eighty pounds, the motor required from sixty-five to eighty amperes at 450 to 475 volts.

The blower was located about 200 feet in the tunnel in the "Y" formed by a branch. A 15-inch galvanized iron pipe extended from the blower to near the head workings. The blower was operated by a 6 K. W. shunt motor arranged with a reversing switch so that the smoke could be exhausted directly from the head of the mine without scattering it through the other tunnels. Also by this method fresh air could be sent directly

to the miners, and the work carried on with the least interruption possible. The blower required seven to ten amperes at 475 volts.

The hoist was set up in a branch from the extreme inner end of the main tunnel some 300 feet from the compressor, and was operated by a 25 K. W. series street car motor controlled in the same manner. It was arranged with a drum for 600 feet of ¼-inch wire rope in one layer. The shop test of the motor showed 1300 pounds raised 600 feet per minute. The normal load was 700 pounds at 600 feet per minute.

The wire in the tunnels was of heavy weather proof insulation tied to heavy porcelain insulators bolted to wooden pins which were driven into holes drilled in the quartzite roof and walls. The location of the holes for the insulator supports so as to have the wire clear all obstructions, was done by two men, each with a lighted candle. By holding a candle at one pin and the other a few feet ahead at such points as allowed the lights to be seen by both men, the proper places for the pins were rapidly located. There was a heavy condensation of moisture on the insulators and wire. This was effectively prevented by coating them with P. & B. paint.

One of the greatest troubles experienced in the operation of high altitude electrical plants is from lightning. Electrical storms are of very frequent occurrence, heavy discharges from the lines occurring sometimes during clear weather. The arresters used on this plant were of the General Electric Co. magnetic blow-out type. Four were placed at the mine, and two at the station. As the mine was a dry one, it was difficult to get a suitable ground at that end. A good sized basin was blasted out of the quartzite near the mouth of the tunnel, and this was filled with charcoal, and the arresters grounded to a copper plate placed in it. The basin was kept damp by water occasionally thrown in it.

The transportation of the station materials and machinery was done by wagons in the usual manner. But that for the mine had to be taken over a very steep, crooked and more or less dangerous trail. All apparatus had to be entirely dismantled. The small parts and attachments were packed in ore sacks and carried on burros. The next larger sizes, such as bearings, small gears, pulleys, etc., were wrapped in sacks and loaded on mules. All pieces too heavy for mules or of such shapes that they could not be balanced on pack saddles, were moved on sleds. These sleds were made of 2x4-inch pine, from 3 to 8 feet long, and having a width of 20 inches. A sled was used for each of the pieces such as armatures, fields, pole pieces, sections of bed plates, gears, cylinders, air receiver, etc., etc. Some of these pieces required the use of four horses in tandem to move them on the trail. In passing the zigzags, blocks and ropes with two horses pulling down hill, was found to be the most secure and rapid method. Several of the parts of the equipment required the use of four horses, three men and a good supply of tackle, crow-bars, etc., about five days to move each one to the mine from the railway station, a distance of about 2½ miles. Only a few pieces received scratches and bruises, and only one piece jumped the trail, and this fortunately did not receive serious damage.

A rough test was made of the station. While not strictly accurate, it may be of some value in planning such installations.

When the output of the generator was eighty-five amperes at 575 volts, the average velocity of the water in the tail race was 188 feet per minute. The tail race, 6 feet 7½ inches wide by 4 feet deep by 150 feet long, was made of planks and had a fall of ⅔ inch per foot. The water velocity as given was obtained by counting the time for light floats to travel about three-quarters of the length of the race. These floats were placed in the middle, and in various parts of the surface of the stream. The depth of water for this load was from 9½ to 10 inches.

The approximate cubic feet per minute was then as follows:

$$\frac{79\frac{1}{2} \times 10 \times 188}{144} = 1033.$$

Elevation of standing water in the penstock 103 feet above datum.

Elevation of standing water in the lower end of draft tubes 26.2 feet.

$$\text{Total head} = 103 - 26.2 = 76.8 \text{ feet.}$$

Friction loss in 30-inch pipe for 1037 cubic feet per minute = 4.3 feet.

$$\text{Effective head} = 76.8 - 4.3 = 72.5 \text{ feet.}$$

$$\text{H. P. of water} = \frac{1033 \times 62\frac{1}{2} \times 72.5}{1033} = 142.$$

$$\text{Electrical H. P. output} = \frac{85 \times 575}{746} = 65.5.$$

Velocity of water in tail race for friction of station plus 40 — 20 C. P. 3.6 watt lamps was 88.8 feet per minute, the depth 4 inches = 19.6 cubic feet per minute.

$$\text{H. P. of water for friction plus the 40 lamps} =$$

$$\frac{19.6 \times 72\frac{1}{2} \times 62\frac{1}{2}}{330,000} = 26.9.$$

PROF. J. J. THOMPSON regards the chemical atom as made up of a large number of similar bodies, which he calls "corpuscles." His theory has been adopted by many scientists.

\* Trans. Am. Inst. Elec. Eng., April, 1901.

## Summit County, Utah, Mines.

[STAFF CORRESPONDENCE.]

The Daly-West mine at Park City is producing 250 to 300 tons of ore per day, which is a considerable increase over that of last month. Of this, about 170 tons are milling ore, the balance first grade or smelting ore. In March, 1900, the writer gave in the MINING AND SCIENTIFIC PRESS a careful description of the underground workings and ore bodies in this mine, and how its ores were handled through the Ontario-Daly and Daly-West ore tunnel, which strikes the Daly-West shaft at the 900-foot level. A trip underground there to-day discloses much the same conditions as were described previously, except that the ore body, which runs northwest and south-east, has been opened at various new points and more extensively exposed; also that a 100-foot winze has been sunk below the 1400-foot level, all the way in ore. On the 900-foot level a crosscut is being run to cut the ore at a nearer point by reason of a turn made in its trend. The bulk of the ore on this level comes from a section about 3000 feet from the shaft. One of the most interesting pieces of work in this mine is to be seen on what may be called the "blind seventh," which is entered by a shaft and ladderway that run 180 feet vertically from the ninth level upward. Here is opened what is proving to be an extensive body of silver-lead carbonate, carrying also some copper and gold. The ledge lies in a nearly horizontal position in most places and seems to have been cut off from that on the ninth by a great roll of lime and porphyry. One of the chambers stope out is seven sets wide and five sets high, a face of ore of those dimensions appearing on the side in the direction of which the work is proceeding. The large tonnage being shipped from this blind level is dumped through chutes to the ninth level, where there is car trackage to the shaft and ore tunnel. The mine work is superintended by John A. Kirby, who was formerly superintendent of the Bullion-Beck at Eureka, Utah. The mine foreman is John McSorlie, who opened the mine and demonstrated its value a number of years ago, since which time he has been continuously connected with the property.

One of the interesting features of the Daly-West property is the concentrating mill, of which F. W. Sherman is superintendent. He has made some experiments which may be of interest elsewhere. In general, the mill is provided with crushers, wet screens, jigs, hydraulic settlers and concentrating tables. About 50% of the values are saved in the jig product. Jig No. 1 is supplied by the oversize from a 3-mesh screen, the oversize from a 4-mesh screen going to No. 2 jig. The tailings from these two jigs pass to two Huntington grinders. The material that fails to pass a 6-mesh screen goes to No. 3 jig, that which is an oversize from an 8-mesh screen passing to No. 4 jig. The tailings from jigs Nos. 3 and 4 pass direct to a specially made Wilfley table, gauged for coarse concentration, which produces a middling that is returned to a Huntington for regrinding. Nos. 5 and 6 jigs are supplied by the undersize from an 8-mesh screen, the slime water being separated from the product before it goes to the jig. The tailings from jigs Nos. 5 and 6 go to Wilfley tables for reconcentration. This being an unsized product, a 5-foot width of middlings are caught and carried to a second table for a third concentration. The product that passes through the Huntingtons, after the slime water has been drawn off, is distributed to five Wilfley tables, where concentrate and middling products are made, the latter being reconcentrated on other sets of tables. Thus four grades of middlings are made, each of which is reconcentrated. The slimes are carried to a preliminary settling tank, so constructed that the slime water gets a run of 500 feet back and forth in the tank, which effects a sizing of the slimes. The water is then drawn off, leaving the pulp, which is dropped to four hanging tanks below, which supply material to that number of tables. A certain grade of pulp is made for each tank by gravity sizing. The overflow of water from the preliminary tank supplies the jigs with water. Any excess of slime water passes to the waste gate through twelve hanging tanks, each 4x4x10 feet. The pulp caught here will, 90% of it, pass a 200-mesh screen. Mr. Sherman estimates that in this mill 45% of the values stops on a 30-mesh screen, 27% stops on a 100-mesh screen, 9% on a 200-mesh screen, and that 19% of the value passes a 200-mesh screen. That which passes the 200-mesh will run 5% lead. In handling at present 170 tons of ore daily in this mill a volume of water equal to only eighty gallons per minute is used.

The Ontario mine is hoisting about 100 tons of ore per day, all of which is now shipped to the smelter. Ontario ores are quite siliceous and carry some copper as well as silver, making an ore in demand at the smelters, and it is said an offer was made by the smelting company that was deemed advantageous to the Ontario mine. The old Marsac mill, which includes stamps, driers, roasters and the Russell leaching process, will now operate on tailings which accumulated a number of years ago at the old Ontario mill. The latter mill was one of pan amalgamation, chloridizing and roasting, and the tailings which are

to be treated at the Marsac are said to run ten ounces silver.

Within the last few months the Ontario shaft has been sunk from the 1500 to the 1700-foot level, and a crosscut is being driven from the bottom of the shaft to the ore body. This 200 feet additional depth vertically is equivalent to about 300 feet or over of depth on the incline of the vein. The fifteenth level, which is the lowest one on which the ore has been opened, shows a better grade of carbonate and sulphide ore than was found on the level next above it. A 3000-gallon per minute pump has been put in to handle any possible surfeit of water that may come in on the 1700 level, as that is 200 feet below the level of the Ontario drain tunnel.

It is learned at the sampler that about 8000 tons per month of crude ore and concentrates are being shipped from Park City. The concentrates comprise about one-third of this tonnage.

C. N. Loring is operating a concentrator in the gulch below Silver King, on an old hand-jigging dump, which was made before the erection of the present Silver King mill. He handles about 1200 tons per month.

Marcus Barnes also runs a series of jigs and concentrators on the final tailings that pass down the gulches below the Daly-West and Silver King mills.

The Anchor mill makes a heavy jig product, the tailings therefrom making two or three grades of table concentrate. The ores here are rather low grade as to silver and lead, and carry from 16% to 20% zinc in an iron gangue, which is not saved. By the addition of other tables an effort will be made to handle the tailings which run so heavy in zinc and iron. This mill receives practically the entire product of the Anchor mine, which amounts to about 100 tons per day.

The Quincy mine, which has a hoist and compressor over a 400-foot shaft, is creating much interest in Park City district because of the good body of high-grade silver-lead carbonate ore that has been opened therein. In the fore part of last winter a considerable tonnage was shipped from the property, which is reported to have run about \$90 per ton. Shipments are now to be resumed on the completion of a wagon road. The property is close to the Daly-West, but higher up the hill than the latter.

Park City, Utah, May 15.

### The Use of Tamping in Blasting.

TO THE EDITOR:—In your issue of the 4th inst. appears a communication signed by R. H. Bemis on "Tamping in Blasting," the writer of which asserts "that not one valid reason can be advanced why dynamite should be tamped."

This statement is correct if the holes are already full of water, or if they are to be fired simultaneously with a battery; and happen to be all "down holes." One or two shots can be fired with ordinary tape fuse without tamping; but in blasting a "round" of machine holes the common way, and "spitting" the fuse, if no tamping were to be used there would be far more chance that many of the holes would miss, as the concussion of the first exploding holes is almost certain to jar or tear out the primers and fuse in some of the yet unexploded ones unless there was tamping to hold each primer in its place. This is the principal reason why tamping is employed.

The fact that all nitro-glycerine compounds, known as dynamite—Giant, Hercules, Judson, Vigorit and other powders of this class—will blast just as well without tamping as with it, is well understood by every practical miner of intelligence, and is universally acted upon in hydraulic work; the large boulders exposed in piping are "bulldozed" by simply laying the powder loosely on top of the rock to be removed, covering it with a few shovelfuls of earth, and exploding the charge with a capped fuse.

I have some curiosity to know how a round of holes can be loaded and blasted in a steeply inclined or perfectly vertical upraise without using tamping.

Now as to filling up the hole with a rag. Some miners use old sacks, pieces of rope or rags to tamp with; they usually discontinue it after a time, and sometimes quite suddenly, if working in a large mine where the foreman is "onto his job," for there is nothing much worse than the smell of burnt or exploded rags in the usually close atmosphere of a mine.

If all the men working in the drifts and stopes of a large mine made a practice of using rags for tamping the mine would soon run short handed and

the company doctor would have his hands full of sick miners.

If all miners were made to sift their tamping through a coarse screen before using and were always provided with the best triple-taped fuse, and good cap crimpers, missed shots would be of rare occurrence. A good enough screen for tamping can be made by punching the bottom of a pan full of holes with a round 20d nail. Tamping grabbed up at random and stuffed into the drill hole is the cause of many missed shots, as a large piece of hard quartz is almost certain to cut the fuse and the slightest moisture will then gain access to its interior. If tamping is screened fine there will be little chance of breaking or cutting the fuse. This seems a small matter but it is the details that are to be studied.

Big Oak Flat, Cal., May 16.

### Jeffrey Century Belt Conveyor for Handling Ore.

The accompanying illustrations show a system of the Jeffrey Century belt conveyors furnished the Arminius Chemical Co. of Mineral, Virginia, by the manufacturers—The Jeffrey Mfg. Co., Columbus, Ohio.

Fig. No. 1 shows a special conveyor used in connection with the jig washer. This conveyor has special carriers which are adjustable so that the belt can be made concave or convex to suit the condition of the material so as to allow the water to drain off. This special conveyor delivers the ore upon the storage conveyor, which is about 200 feet long, more fully shown in Fig. No. 2. The storage conveyor is provided with a traveling tripper, which delivers the material at any point and at either side along the run.

The Century belt used in this conveyor is manufactured especially for this work, its carrying sides being re-enforced with an extra thickness of rubber of such a composition as will best resist wear and tear,

FIG. 1.

FIG. 2.

while it is supported on special iron troughing carriers, which are self-oiling, one oiling lasting for months.

### Economic Values Below Cities.

When we have long become accustomed to a thing, we are apt to settle down to it with an "always was, is now, and ever shall be" sort of sentiment till we are awakened up, it may be by a wide awake progressive man of science, or by some scientific man who knows how to apply his science. Take some large city we have lived in from our father's time which has existed many years, perhaps for generations. We have never thought about that city being underlain with valuable coal, oil or gas at available depths—never bothered ourselves with the idea; no one ever sug-

gested it although we all knew that coal or oil existed and was developed in the surrounding country. Some geologist comes along and with little respect for houses, streets, and city conventionalities, regards the city as a geological problem and forthwith declares that from careful observations made in the neighborhood, or from his own geological knowledge, the results of experience, he is convinced that the city is underlaid by coal, or it may be oil or gas.

As a case in point look at the discoveries of oil underneath Los Angeles, California. Little did the earlier inhabitants and real estate men, when they laid out their parks and erected their beautiful houses in that beautiful city, imagine that in a short time their grass plots and parks would be invaded by a forest of oil derricks, and the finest residence portion of the city be reeking with the odor of oil, as the result of the enterprise of one or two citizens. From an aesthetic point of view it might have been wished that that beautiful city had been spared such a discovery within its limits and that oil had been found farther from it.—*Mines and Minerals, Scranton, Pa.*

## Mining and Metallurgical Patents.

Patents Issued May 14, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

GRINDING OR CRUSHING ROLLS.—No. 674,057; T. A. Edison, Llewellyn Park, N. J.

The combination of two side frames, each made in two parts with essentially parallel abutting edges, connecting bolts passing through sleeves cast integrally with the sections of side frames to permit relative movement of sections, a compression plate connected to one section of each side of frame, a second compression plate connected to connecting bolts on each side, compression springs between plates tending by elasticity to hold sections of each side frame together, two shafts carried in bearings in corresponding sections of side frames, grinding or crushing rolls carried by shafts, two driving shafts mounted with shafts of rolls but in stationary bearings, gearing between driving shafts, and wabbling connections between driving shafts and corresponding shafts of grinding or crushing rolls.

FURNACE.—No. 674,079; F. Danner, Springdale, Pa.

A heating or melting chamber, two gas regenerating chambers, two pairs air regenerating chambers arranged on opposite sides of gas chambers, regenerating chambers being connected to heating chamber, flues extending under gas chambers and having opposite ends connected respectively to gas conduit and stack conduit, valves controlling flow of gas to and from flues, flues extending from air regenerating chambers to stack conduit, and provided with air inlet ports intermediate of stack conduit and regenerating chambers, and valves controlling flow of air to and of gases from flues.

PROCESS OF MAKING LEAD OXIDE.—No. 674,031; A. G. Fell, New York, N. Y.

Process of treating lead ore or similar lead compounds, which consists in first converting lead into a

lead salt decomposable with alkali, then treating mass with alkali to convert lead into oxide, then dissolving out soluble salts of alkali, then heating residue containing lead oxide with solution of alkali to dissolve lead oxide, and then cooling solution to allow the oxide to crystallize out.

SAMPLER.—No. 674,095; G. A. Overstrom, Anaconda, Mont.

A chute, branch main and sample chutes communicating therewith, a deflector separating branch chutes and normally located to direct material to main branch chute, a rock arm fixed to shaft, a main shaft provided with a cam for actuating rock arm, a latch serving to hold rock arm normally elevated, a rotating member provided with means for intermittently disengaging latch to permit movement of rock arm, and connecting means between main shaft and rotating member for imparting movement to latter.

ORE CLASSIFIER.—No. 674,169; J. Klein, Desloge, Mo.

A chamber or hopper adapted to receive mixture containing ore and sides and bottom of which are integral, rendering it devoid of cracks or joints at corners, and having openings through sides to permit passage of ore, classified ore chambers at sides of chamber or hopper to receive ore which passes through openings, air pipes leading through sides and bottom of hopper, and water pipes leading into chamber or hopper and directed towards openings in sides, so that, when water is admitted through pipes, ore will be driven through openings into classified ore chambers.

CONCENTRATING JIG.—No. 674,214; S. Orr, Leadville, Colo.

A water tank, a jig pan having perforated bottom, held submerged in water in tank, slotted links connected with pan, a jig beam provided at one end with means for engaging slots in links and fulcrumed near end, a toothed wheel engaging longer member of jig beam at free end to impart downward movement, and

means for swinging beam upward when released from toothed wheel.

Jig.—No. 674,269; J. Klein, Desloge, Mo.

A screen compartment, a plunger compartment to contain water, a hollow air-charged plunger having sloping top within plunger compartment, guides for plunger, and means for operating plunger.

AMALGAMATING AND CONCENTRATING APPARATUS.—No. 674,299; J. H. Lancaster, New York, N. Y.

Tank having lower discharge, of number of alternating, horizontally separated, triangularly arranged amalgamating plates, uniformly disposed throughout tank interior as to present at the top, in same horizontal plane, inlets of several vertical tortuous passages, together with top feed and means for continuously circulating material and water simultaneously downward through passages to and through discharge.

ORE COOLING DEVICE.—No. 674,354; F. C. Durant, Philadelphia, Pa.

An ore chamber having bottom spaced from walls and provided with discharge openings, series of sheds in chamber, sheds of one series alternating with those of next series to subdivide the ore and form air conduits, walls of chamber having air inlets at ends of several sheds and sheds of lower series extending over discharge openings, with discharge device traveling across bottom, and comprising endless chains exterior to chamber, and a scraper having inwardly curved ends and connected at ends to chains, and means for actuating chains.

PROCESS OF REDUCING METALLIC SULPHIDES.—No. 673,974; L. M. Bullier, Paris, France.

Process of reducing compounds containing sulphur, which consists in heating compounds to high temperature and to fluidity and acting upon same, while fluid, with calcium carbide, thereby causing calcium carbide to react upon compounds and to effect reduction.

New York is about to pass a law to tax mortgages and other securities by means of stamps. A stamp representing the annual tax must be affixed to the document and cancelled in order to make the instrument legal. This makes each man his own tax collector.

A TELEGRAPH LINE has been completed from Loango, in the West African coast, to Brazzaville, in the Congo State, and a cable is being laid from the latter place to Stanley Pool, in the heart of Africa.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

The Circuit Court of Appeals at San Francisco has dismissed the suits now before Judge Noyes of Cape Nome, Alaska, in which Alexander McKenzie was appointed receiver of the gold and mining property in litigation. The appeal to the court was not for dismissal of the suits, but for the removal of McKenzie as receiver. The court decides that it has authority to inquire into the suits entirely and then dismisses the bills of complaint.

The Secretary of the Interior has ordered a new hearing in the contest over the land on which Skagway is situated. This is the land case from the Commissioner's decision on which both parties appealed.

### ARIZONA.

#### COCHISE COUNTY.

The South Bisbee C. M. & T. I. Co. has bonded its copper properties near Bisbee to a Glasgow syndicate at \$2,225,000 until September 1. The property comprises forty-seven patented claims, covering about 661 acres.

The work on the properties of the Lowell & Arizona M. Co. is partially temporarily suspended, water coming in at 980 feet in the main shaft, which is down 1018 feet. The present management, W. S. Clark Supt., took charge of the properties on Feb. 1st, and has since that date done over 2500 feet of drifting, almost entirely upon the lower levels. The question of the introduction of the necessary pumps is now being considered by the Eastern officials of the company.

#### GRAHAM COUNTY.

L. A. Dunham and C. F. Whitcher of Denver, Colo., are reported to have sold a large group of mining claims in the Greenlee district to an English company for a large sum. A large cash payment has been made. The property will be developed under L. A. Dunham, manager.

#### MOHAVE COUNTY.

J. Martin has bonded his gold mines on the west slope of the Harqua Hala mountains to the Mexican Copper Co. at \$160,000. The same company have also bonded the Rogers properties, near the Bill Williams Fork of the Colorado river, and expect to operate heavily in this section, equipping their new purchases with modern machinery. The camps have already been started and a large force of men are being put to work.

#### SANTA CRUZ COUNTY.

C. W. Rice and J. W. Lennox of Helvetia, for Eastern people, have bonded the Tres Amigos gold mining property, in Oro Blanco district, from S. W. Champion of Alhambra, Cal., at \$150,000. The purchasers are to increase the plant at once.

#### YAVAPAI COUNTY.

Machinery for the W. J. Lester Co. of Fredonia, N. Y., which company owns eight placer claims in the Big Bug district, has been placed on the ground, a steam shovel with an amalgamator attached, pumping water from the Big Bug creek.

L. T. Stoddard has arranged to start up the Stoddard copper properties on Copper mountain, near Prescott. It is understood the smelter will be blown in soon and a large number of men put to work.

The Octave M. Co., in Weaver district, has uncovered a large body of high-grade ore on the 600-foot level. The property belongs to a number of Standard Oil men.

#### YUMA COUNTY.

J. L. Eicholz, secretary of the Arizona Giant C. Co., says that improvements are contemplated by his company at Ehrenberg, among them being a smelter and a long-distance telephone line to Yuma via Picacho.

Judge J. Rivers has completed the installation of machinery on the Good-enough group, near Ehrenburg, of which he is Supt. A contract to sink a 200-foot shaft is to be let.

### CALIFORNIA.

#### ALPINE COUNTY.

P. Kurtz, part owner and Supt. Boulder Hill mine, near Gardnerville, says the lead is from 1 to 3 feet in width and is free milling. A 10-stamp mill has been erected and it is expected to run steadily on ore blocked out.

#### AMADOR COUNTY.

At the Centennial mine, Drytown, Supt. Gross states they are still drifting for the north ore body.

The Amador Phoenix G. M. Co., recently incorporated, has begun operations on the Toscano claim, near Clinton. The company is composed of Jackson men, R. C. Rust being president; S. Spagnoli,

treasurer; L. J. Fontenrose, secretary; J. E. Dye, superintendent.

#### BUTTE COUNTY.

Diamonds are being searched for near Cherokee and at Big Bend. It is reported several finds have been made lately.

The mine of W. Pinkston at Big Bend is to be further developed by sinking deeper.

Thornton, Wing & Co. have struck a good piece of gravel on the North Fork of Feather river near the Wing & Malone claim.

#### CALAVERAS COUNTY.

The Gwin Mine D. Co. has just declared dividend No. 21—\$15,000—making \$70,000 paid in 1901 and \$221,500 to date since the reopening of the mine by the company.

The El Dorado quartz mine, in Smith's Flat district, has been bonded to J. J. Schmadeke of Angels at \$40,000.

Work is being pushed at the Canary quartz mine, near Fricot City. The mine is a recent discovery by A. Poe and T. J. Earhart of Sheep Ranch, and some good rock has already been taken out. The shaft is now down nearly 100 feet.

#### EL DORADO COUNTY.

Alvinza Hayward and C. D. Lane have bonded the New Discovery quartz mine, near Latrobe, owned by S. Chaix and G. S. Estey, who discovered it in 1900. The surface indications are good.

#### HUMBOLDT COUNTY.

The John Burger copper mine, near Ornbau valley, has been bonded to Halliday & Co. of London, England, at \$150,000, their agent depositing \$10,000 forfeit. The last payment is to be made in sixteen months, and the company further obligates itself to build a 30-ton smelter.

#### NEVADA COUNTY.

The Glencoe mine on Canada hill at Nevada City, owned by A. Nevins Sr., was examined by C. H. Noble and A. Nevins, acting for the London Exploration Co. It is said the mine may be opened up shortly.

#### SHASTA COUNTY.

It is believed a syndicate will be formed to fully explore Bunker Hill, near Redding, by a tunnel, to be driven from a point near the river, through the hill to the bed of Middle creek. The top of the hill is honeycombed with tunnels and drifts on small quartz seams, from which hundreds of thousands of dollars have been taken. All the seams run into large quartz ledges, but the pocket hunters have not gone down on them.

The Milkmaid Q. M. Co., at French Gulch, is crushing regularly with good results and plans have been made for extensive development. Sinking on the Wheeler ledge will be started soon.

L. Johnson noted some quartz lodes croppings in a Shasta City street and proceeded to sink on the ledge just outside the street line. At 10 feet depth he has from 18 to 24 inches width of a ledge prospecting rich in free gold. The ledge runs through the main street of the town and has been traveled over for fifty years without its possible value being noted.

It is reported that development work on the Mammoth copper mine, west of Keswick, has been resumed by an Eastern syndicate, operating under an option. The Mammoth is owned by R. M. Saelzler, J. Wallace and other Redding people.

J. Pfeffer has bonded the Mullen and Poorman gold quartz claims in Lower Springs district to M. J. Graham, a Montana man, at \$5000 until January 1, 1902, development work to be prosecuted without intermission.

The Hiatt mine, at Quartz Hill, has been started up with fifteen men. D. G. Hunt is manager.

The Gladstone, at French Gulch, has been reopened by Capt. Roberts and his associates, and it is reported that the ore shoot has been recovered and milling will soon begin. T. Saulsbury is manager.

#### SIERRA COUNTY.

J. W. Finney has completed the repairing of the main tunnel at the Fir Cap mine. One shift will be worked extending it until more air pipe is obtained. Five men are employed.

#### SISKIYOU COUNTY.

The Black Bear G. M. Co., incorporated in Maine, capital \$1,000,000, with John Daggett of Black Bear as Supt., is preparing to sink a new double compartment shaft 600 feet from the surface into virgin ground, from which connection will be made with the old works. Men are at work putting in the machinery.

The Jilson & Roberts mine, near Hornbrook, has reduced its force to ten men, who are engaged in prospecting. The company has a large ledge of low-grade ore, but the mill is not suited to work low-grade ore on an extensive scale.

#### TRINITY COUNTY.

The cyaniding plant of the Headlight mine, near Trinity Center, is being in-

stalled and will begin extraction within a few weeks. The ore is iron gossan covering an area several hundred feet in extent with a probable thickness of at least 40 feet. It rests on unoxidized auriferous sulphide ore. The surface ore is said to assay \$5 or \$6 per ton.

#### TUOLUMNE COUNTY.

The Mapes quartz and placer mines, near Sonora, have been bonded to W. E. Coul at \$5000. Men have been put to work developing.

The Golden West M. & M. Co. has bought a hoist to sink from 1000 to 1500 feet in depth, which they expect to start about July 1st. The mill grading is nearly complete and the mill is expected to begin crushing ore on July 1st. F. R. Restano is Supt.

The strike in the Dreisam mine at Arastraville continues good. The mill has been started.

The mill on the Ajax mine, on the Major ranch, is being overhauled and improved by the addition of new machinery. Two new concentrators and a Woodbury table are being put in. A pipe line, 1100 feet in length, will be laid from the ditch to the mine.

#### YUBA COUNTY.

The Grass Valley men who bonded the Cabbage Patch mine, near Wheatland, are working ahead and now have ore showing free gold in three different places. They will take out a large crushing and haul it to a mill in Grass Valley; if the ore pays sufficiently, a mill will be put up at the mine.

### COLORADO.

#### BOULDER COUNTY.

The Miser group at Sugar Loaf, near Boulder, noted for its tungsten deposits, has been bought by the Great Western Exploration & Reduction Co. for \$75,000. The new company is already realizing on its investment. The extent of the tungsten veins was not known for some time, but since they were uncovered they have been worked with a large force of men. The Boyd mill of Boulder has been leased to concentrate the tungsten ore, whence it is shipped to New York and brings from \$125 to \$200 per ton. The capacity of the mill will be enlarged.

#### CLEAR CREEK COUNTY.

J. F. Antisdale of Palmyra, N. Y., president of the Gum Tree Co., reports that the money has been raised to develop the mine, and that an air compressor and other machinery will be bought. Sinking of the shaft is to be resumed.

The Comstock L. & M. Co. has been incorporated by G. Hughes, H. C. Watt and C. Trumbull of Denver, capital \$10,000, to operate mines in Arapahoe and Clear Creek counties.

The Happy Dream M. & M. Co. has been incorporated by J. A. Pearce, E. W. Dillon and J. W. B. Smith of this county, capital \$300,000, to operate mining property in Colorado and elsewhere; principal office, Idaho Springs, Colo.; branch office at Wilkesbarre, Pa.

#### GILPIN COUNTY.

A consolidation of the Robert Emmett, Queen of the West and Golden Gate mines of Black Hawk has been made, and a cage shaft on the Robert Emmett, 425 feet in depth, will be sunk 200 feet deeper and a level run west to connect with the Queen of the West mine; W. H. Nicholls is manager.

#### GUNNISON COUNTY.

The Italian Mountain district, in the northeastern part of the county, promises to be very active during the summer. Dorchester, a mining camp founded last year, is the postoffice. It is a portion of the Tin Cup mining district. Lately the announcement was made that much of the dump thrown out from properties worked years ago was good ore. This brought new life into the locality and there are now several producing mines.

F. Adams, owning the old Denver City mine at Iris, is considering a proposition to bond the property, which has been idle for some years. The shaft has opened a good body of ore, carrying small values in silver and considerable zinc and copper, which could not be profitably treated in the past, but it is thought that the improvement in methods will permit of its being made a paying proposition.

#### HINSDALE COUNTY.

W. H. Davis of Colorado Springs and A. G. Gorham of Denver, of the Sherman M. & M. Co., operating the Sherman and Champion mines at Lake City, have started work on the property. E. Ray, a mining engineer, is manager. The Champion is a copper proposition. The Sherman has gold values predominating. Both are milling propositions and a mill will be put in shape for the treatment of the ore.

#### LAKE COUNTY.

I. Hale, E. S. Douglass and L. C. Robinson of the Leadville Electric Power Co. and H. L. Rogers, an electrical-hydraulic

engineer, for capitalists who propose financing the company which is to transmit electrical energy from Homestake creek to supply Leadville and mines with power, have been inquiring into the average horse power consumed in the district, which is about 20,000 per day.

Leadville mine owners and operators are preparing to build a smelter at that place to reduce the heavy zinc-lead ores that are penalized at the custom smelters. The success of the mill running on zinc-lead ores at Rico has started the interest. The separation is effected magnetically and tests are being made on Leadville ores. J. P. Cappau of Joplin, Mo., and C. V. Petrus of Iola, Kan., have been in Leadville, looking into the zinc treatment proposition.

The Empire M. Co., on Long & Derry hill at Leadville, will begin making regular shipments to the smelters. The company was organized by S. G. Collins in Boston. At 300 feet from the surface a body of iron carbonates was opened up which nets the company \$9 per ton.

At the Gordon mine, Twin Lakes district, the tunnel to get under the ore opened in the upper levels of the mine has now progressed 1200 feet into the mountain and is 800 feet below the surface. Connections are to be made with the ore body by upraises. Surveys are being made for a tramway and an amalgamating and concentrating mill, and work on them will commence as soon as the weather will permit hauling.

#### MINERAL COUNTY.

The American Sulphur & Mining Co. have made another payment of \$1000 on the Sulphur mines. Work on the property is demonstrating that the sulphur beds are very extensive.

#### LARIMER COUNTY.

What promises to be a district of considerable importance has been opened near the northern boundary of the State on the eastern range of the Medicine Bow range, near Virginia Dale. Prospects found a year ago in Wyoming, just north of the line, have been found to extend into Colorado, along Trail, Sheep and Fish creeks, tributaries of the Cache la Poudre. Considerable placer gold has been found in all these streams, but it is not possible to work large tracts by hydraulics as the gulches are narrow. Several lodes have been opened.

#### PARK COUNTY.

The Colorado Springs Co. has made the first payment of \$6000 on its bond on the Jim Blaine ledge. F. Leonard, of Alma, is manager. The owners are Colorado Springs people.

The London mine, Alma, is shipping \$500 ore, value principally in gold. The vein is 6 inches to 2 feet wide. The London has produced to date about \$1,500,000.

#### SAGUACHE COUNTY.

North of Crestone is a large district carrying low-grade, free-milling gold ores which promise well with further development and with milling facilities on the ground. The town of Pyke has been located there and has been made a post-office, and covering an area several miles in extent around it are prospect holes sunk by prospectors who, looking for high-grade ore and failing to find it, abandoned many properties which would pay a profit if the ore could be milled on the ground. The developments range from 50-foot shafts to tunnels 600 feet long. One of these properties has several shafts and a tunnel 600 feet long and has opened a body of ore 35 feet across that averages \$7.80 per ton in gold. Another property has a large ore body that runs \$20 to the ton in gold, and several other claims that have less development show good veins running from \$6 to \$15 in gold, all free-milling.

#### SAN JUAN COUNTY.

A. Sturgeon, who has been operating the Smuggler lode, located in Cascade basin of Little Maggie gulch, has sold a half interest in the property for \$500. The lode is an extension of the Anti-Periodic, from which extremely rich ore has been extracted for several years.

#### SAN MIGUEL COUNTY.

W. S. Buckley, manager of the Ophir Con. M. Co., says both No. 3 and No. 6 levels of the Butler claim at Telluride are carrying from 2 to 4 feet of mineral, from which enough first-class ore has been shipped to cover operating expenses. The foundation for the new mill will be begun next week. A tramway from mill to mine will also be installed.

The Japan Mines Co., Telluride, has leased 5 acres on the Gold Run placer from the Peck Cyanide Co., agreeing to erect a milling plant on the leased ground.

#### TELLER COUNTY.

W. H. Colburn, of Cripple Creek, has sold the Rustic and Necessity claims, in Cripple Creek district, to L. A. Colburn, for \$5000.

Four towns in the Cripple Creek dis-

strict are in danger of a water famine by the bursting of the dam of the Victor reservoir at Pike's Peak. They are Victor, Goldfield, Altaman and Anaconda. Mining operations are also affected. The Portland mine depends on it for 100,000 gallons of water a day. Other mines will be forced to shut down. The dam contained 65,000,000 gallons of water, and a stream 20 feet deep and at places 300 feet wide went down the mountain through West Beaver valley to the Arkansas river.

The Brodie cyanide plant at Mound City, closed for eighteen months, is again in operation: W. Russell, manager. There are about 6000 tons of tailings available, carrying about \$8 a ton.

The Practical Leasing Co., on the Pauper claim, will install a larger plant of machinery on their lease. The company intends to run a crosscut to the vein opened in the 125-foot level and which is supposed to be the extension of the Hull City placer vein.

The Anaconda Co. has given a lease on the dump of the old tunnel level on block 40 to a Mr. Camp of Cripple Creek. The royalties are at the rate of 25%.

The Transit G. M. Co. has made a strike in the Silver Bell claim. At a depth of 75 feet, 30 feet from the shaft, Lessee Cockburn has opened a good vein of ore, giving average assay values of \$20.20 to the ton.

#### IDAHO.

##### BLAINE COUNTY.

Flood & Higge have leased the Relief mine, adjoining the Minnie Moore, at Broadford, and will begin operations immediately.

An important discovery is reported in the Liberal mine, on the Hailey gold belt. A drift at a depth of 150 feet has opened 6 feet of solid ore that averages \$38.44.

A. Griffith, superintendent of the Tyrannis mine at Hailey has received a cablegram from Mr. Thorndike of Paris, France, instructing him to build a mill at once at the Tyrannis.

The Tiptop mill, Hailey, has been started up.

##### ELMORE COUNTY.

A. Woodward of Chicago of the Golden Age M. Co. at Atlanta says that J. C. Johnson, president of the company, is now at Atlanta, preparing for extensive operations this summer. The 20-stamp mill is being repaired and will be started up. It is anticipated that considerable changes in the machinery of the mill will have to be made.

##### LEMHI COUNTY.

R. W. McBride has bonded the Gold Flint group near Leesburg, at \$200,000, it is said.

##### SHOSHONE COUNTY.

It is reported that the Monitor group, carrying copper, in St. Regis district, owned by O. Hill and associates, has been bonded to Eastern parties at \$150,000.

##### WASHINGTON COUNTY.

Arrangements for building the smelter at Weiser by L. Hall have been completed. The site is at the mouth of the Weiser canyon, about 8 miles from town. The plant will handle ores from the Seven Devils, Baker City, Sumpter, Mineral and other points.

#### MICHIGAN.

##### HOUGHTON COUNTY.

The report of the Osceola Con. M. Co. for the year 1900 shows 836,372 tons of rock mined, 683,066 tons stamped. The total receipts from sales of copper, etc., were \$2,108,253 and total costs \$1,559,580; balance, \$576,715; dividends, \$571,200. The cost of stamping was 27.2 cents per ton.

#### MONTANA.

The report of the Hecla M. Co. for 1900 shows: Ore mined, 2357 tons first class, 500 tons second class; smelted at company smelter, 2023 tons; shipped to Omaha, 834 tons; metal yield, 226.4 ounces gold, 232,820 ounces silver, 131,494 pounds copper and 1,013,524 pounds lead; receipts from sales of ore and bullion, \$180,401; total expenses, \$143,930; net balance, \$36,471; dividends paid, \$30,000; total production of mine to date, 208,623 tons. In twenty years—1881 to 1900 inclusive—total earnings, \$10,189,648; total expenses, \$8,123,071. Net earnings, \$2,066,577, and dividends, \$2,027,500. The average earnings in 1900 on first class ore mined was \$76.54 a ton and expenses \$61.06 a ton. Cost of mining, \$33.19 per ton; including second class ore, the cost of mining was \$27.39 a ton.

##### BEAVERHEAD COUNTY.

It is reported that the New Departure silver mine, in the Blue Wing district, has been closed down indefinitely, the reason given by F. Brown, the manager, being that the mine will not pay to work with the eight-hour law in force.

In Dry Gulch canyon, east of Dillon, W. Spearin and others have discovered a ledge of gold-bearing hematite which carries \$8 to the ton; the ledge is 5 feet wide.

#### FERGUS COUNTY.

The mill under construction on the Barnes group, in the North Moccasin district, will treat 100 tons daily. The building has been somewhat retarded by short lumber supply, but Supt. McClean says the plant will begin operations by July 1.

The Spotted Horse mine is being worked by the A. S. Wright Co. and employs twenty-five men. A new hoisting rig has been installed and the mine plant generally has been rehabilitated.

#### GRANITE COUNTY.

J. Hickley will superintend the Basin gulch placer claims, Phillipsburg, this season.

#### LEWIS AND CLARKE COUNTY.

Semensky & Kessler, two leasers at the Drumlunnon mine, made \$5400 for two runs last summer.

The East Helena smelter has resumed operation, the labor trouble having been settled.

The American Eagle mine, Helena, started yesterday morning after six months' shutdown. The high-grade ore will be shipped.

#### MADISON COUNTY.

J. Reed and F. Walker expect to do considerable development work on a coal vein in upper Ruby valley. A company has been formed at Virginia City. A plant may be installed to operate the coal mine quite extensively.

The Red Bluff M. Co., operating at Red Bluff, is reported to intend to build a hundred-ton concentrator at once. It is estimated that there is now blocked out over \$600,000 of ore, from which concentrates will average about \$100 per ton. The plant will be run by electricity.

#### PARK COUNTY.

E. B. Wittich of Livingston, representing an Eastern syndicate, has bonded nine claims near that place for six months. It is said that the syndicate has \$50,000 to prospect with and that a diamond drill will be used.

#### SILVER BOW COUNTY.

The pay shoot lately struck in the Brown's Gulch Homestake mine is holding a width of from 3 to 4 feet. The drift has been advanced about 25 feet, and fifty tons of ore that will average \$125 in gold to the ton have been taken out. The company is now figuring on sinking another 100 feet and driving a level from the bottom. C. Strowbridge is Supt.

#### NEVADA.

##### ELKO COUNTY.

The Dexter-Tuscarora Con. G. M. group, comprising twenty-two claims, is producing about 3400 tons of ore per month, the bulk of which is treated by the company's 40-stamp mill, whose saving is on amalgam plates, the tailings therefrom being cyanided. The result of the last year's work was a saving of \$5.95 per ton of ore, the values being about two-thirds gold and one-third silver. There is now an accumulation of 20,000 tons of tailings, which will be cyanided. All the work and production thus far has been above the 300-foot level. There is one principal vein and several lateral veins. An electric power plant is operated by two Pelton 4-foot wheels from a flume and pipe line, which gives a 400-foot fall. The idea is to operate the mill, hoist and pumps by electric power.

Tuscarora, May 16.

##### WASHOE COUNTY.

The Reno Star mine, at Bryan City, is to have a large mill. The owner, G. Wedekind, proposes to use rolls, instead of stamps, and to give the ore the hyposulphite treatment. Besides rich shipping ore, the mine contains much lower grade rock that may be profitably worked on the ground. More men will be put on at the Bell mine as soon as the drifts are advanced further to give room. A contract has been let to sink the main shaft. Mr. Bell will put a steam hoist on in four or five weeks. The shipping output of the mines is now about thirty tons a day of ore running from \$100 to \$500 a ton. From indications, timbermen will soon be needed. Water is beginning to come in at a depth of 165 feet. As yet there is no necessity for pumps, but a little more depth may require them.

A petition has been circulated at Reno among claim owners, and numerous signed, for a meeting of mining men, to organize a mining men's association, to be a protective organization and to foster the mining industry in the county. One of the ideas is to establish a headquarters for exhibits of ore, plats of mines and literature regarding the mineral resources.

#### NEW MEXICO.

##### GRANT COUNTY.

G. McMillan has bought the Lucky Bell at Central and has commenced work on it. The ore runs well in lead and silver.

B. S. Tipton & Co. of Duncan have four claims at Cottonwood, which they have

developed considerably. Smelter returns on high-grade ore were 26% copper, thirty-five ounces silver and \$2 gold per ton.

The Clear Lake M. Co., A. W. Tennant manager, have sunk a shaft 100 feet and run drifts 100 feet each way along the vein, which is said to be 11 feet wide, milling \$16 per ton in gold. The company has a 10-stamp mill, which is shut down until additional concentrating tables and other machinery can be put in.

A test shipment of ore from the Lord Nelson property at Central was made by the owner, G. Sanders, to ascertain the best method of treatment.

C. Wickey and R. M. Randall have bonded their group of claims near the Fort Bayard reservation to Pinos Altos parties, who will develop them.

#### LINCOLN COUNTY.

The Ruby mine at White Oaks has closed down. A meeting of the stockholders has been called for the purpose of determining a plan for future operations. A hoist, stamp mill and cyanide plant are necessary for further development.

The Estey M. & M. Co. has been incorporated, capital \$500,000, by M. W. Seymour, J. R. Tyman and H. B. Clark.

#### TAOS COUNTY.

E. L. Fowle, president of the New Mexico G. M. Co. of Milwaukee, is inspecting the machinery which his company is putting on the Strawberry mine, near Tres Piedras.

#### OREGON.

##### BAKER COUNTY.

W. L. Vinson has bonded the Mammoth group at Baker City. It is his intention to sink a double-compartment shaft 100 feet and then to drift 100 feet on the ledge. The ledge is 6 feet wide and carries free gold.

The 20-stamp mill of the Cornucopia M. Co., Ltd., is to start up immediately. Twenty-five men are working on the 4000-foot tunnel, run for the Last Change mine, owned by the same company and are in 1710 feet.

The recorded deed of the Bonanza mine, bought recently by the Con. Bonanza G. M. Co. of Philadelphia, composed of Standard Oil people, discloses that the price paid was \$500,000 cash. The owners now value the mine at \$3,000,000.

The final payment of \$20,000 on the Appomattox mine at Baker City by the Columbia M. Co. has been made.

##### GRANT COUNTY.

Z. Houser of Portland and Hinkley & Newman of Pendleton, owners of the Copper King mine at Quartzburg, are closing a deal for a smelter. Mr. Houser says returns from a shipment of ore to Hamburg, Germany, were at the rate of \$384.64 per ton. The transportation from Quartzburg to Hamburg is \$30 per ton.

##### JOSEPHINE COUNTY.

Houck & Haff have bonded the Bowden ledge at Gold Hill and contemplate immediately putting up a hoist and sinking the main shaft to a greater depth.

It is reported that the Copper Stain, at Mount Reuben, is soon to be operated on a larger scale. Supt. J. E. Hutson says that an average of 50 feet per month in the tunnel has been made since February.

The Wimer Bros. & Co. mine, near Waldo, is now owned by the Deep Gravel M. Co., of which W. J. and G. W. Wimer are managers.

A large amount of development work is reported to have been done on Kubli Bros.' Gold Standard mine, on Galls creek, during the past few months. There are now about 4000 feet of tunneling and a depth of 300 feet has been reached.

J. S. Pool, owner with G. Hoffman of a quartz mine in the Applegate district, has sold his interest to F. Bolt of Gold Hill.

H. A. Corliss, Pres. Dry Diggings M. Co., has cleaned up the season's run. A thirty-five day run yielded \$4000, or about \$115 per day with one giant.

##### MALHEUR COUNTY.

A rich gold strike was made in the Little Giant mine at Malheur City. The ledge is about 12 feet wide and has been uncovered for 300 feet. It is owned by R. D. Carter and F. Clark of Baker City.

#### SOUTH DAKOTA.

##### PENNINGTON COUNTY.

It is said the Elizabeth M. Co. of Milwaukee will erect a 40-stamp mill and cyanide plant this season at the Bismarck mine, near Keystone.

About 200 mining companies are now operating in the Black Hills, besides individuals and partnerships. Total number of miners at work is about 4500. Value of the metallic output during 1900—mainly gold—was a little less than \$10,500,000.

##### LAWRENCE COUNTY.

The 1200-ton cyanide plant of the Homestake M. Co. at Lead City is operating successfully. It contains fourteen steel tanks, each of capacity for 600 tons of tail-

ings. The treatment takes seven days, two tanks being emptied and filled every day. The average value of tailings treated is \$1.50 per ton. The Homestake Co. is using 940 stamps and treating about 2000 tons of ore daily. The tailings from 540 go to the new cyanide plant. The other stamps are so located that their tailings cannot be brought by gravity to the new mill. Consequently, the company will very likely erect another plant for the remainder of the stamps.

#### UTAH.

##### JUAB COUNTY.

The Alaska M. Co. of Tintic at the annual meeting elected F. L. Oswald, J. E. Bamberger, L. R. Rogers, H. Bamberger and W. E. Webster directors, and A. E. Kimball of Salt Lake City was made secretary and treasurer. The annual report showed receipts from all sources for 1900 were \$26,812.23. Manager J. E. Bamberger says it is intended to sink the shaft from the 450 to the 600-foot level in a short time.

The Bullion-Beck of Tintic has sued the Eureka Hill and Gemini mining companies for \$2,300,000, value of ores and damages which it claims the two defendant companies are liable for. The Bullion-Beck Co. claim the Eureka Hill Co., M. C. Fox and G. W. Riter entered its ground and in the past four years have extracted over 25,000 tons of ore, worth \$38 per ton net, or \$950,000. The Gemini Co., J. Q. Packard and J. C. McChrystal are accused of extracting during the past three years 30,000 tons of ore, worth \$45 per ton, or \$1,350,000. It is also charged against the Eureka Hill that, after they had mined the ores in question, they caved in the stopes to conceal the trespass.

##### SALT LAKE COUNTY.

L. Ranschoff and F. Shirer are reported to have made a strike in their mine at Bingham. It is a copper and gold proposition. The owners propose to organize a company called the Elks G. & S. M. Co.

The Boston-Terrace C. M. Co. has incorporated, capital \$500,000; C. T. Birchard is president and A. H. Folger of Salt Lake City secretary.

W. C. Orem of the Red Wing M. Co. of Bingham has bought the Eda claim of N. G. Jarrard and J. Lancina for \$4000. It is understood that it was bought for the Red Wing Co.

##### TOOELE COUNTY.

The Stockton G. M. & M. Co. option on the property of the Lion Con. at Stockton has been ratified and a first payment of \$2500 made. By May 19, 1902, a final payment of \$37,500 is to be made; J. J. Trenam is manager.

#### WASHINGTON.

##### SPOKANE COUNTY.

A strike of free milling quartz has been made near Latah. M. Poore and S. G. Hinson, the discoverers, have staked three claims which show a 36-inch ledge, from which they say they get assays of from \$20 to \$25 a ton.

##### WHITMAN COUNTY.

Two claims near Palouse have been bonded for thirty days to Iowa capitalists by H. A. Keym, and development work is to be begun at once.

#### WYOMING.

##### CARBON COUNTY.

The Battle Lake Tunnel Site Co. of Chicago will run a 3000-foot tunnel into Mount Bridger, near Saratoga, from the north, and are already in 300 feet, working with air compressor and drills.

It is reported that the Ferris-Haggerty copper mine, near Grand Encampment, is about to be sold to Boston parties for a large sum. The mine is now shipping sixty tons of high-grade ore to the railroad per day.

##### CHEYENNE COUNTY.

The Centurion G. M. Co. has been incorporated by W. H. Metz, C. Sachs and H. Versteeg; capital \$200,000; to operate in Wyoming and in El Paso, Teller and Clear Creek counties, Colorado, with principal offices at Colorado Springs, Colo., and Cheyenne, Wyo. W. H. Metz of Colorado Springs is president of the company.

#### FOREIGN.

##### BRITISH COLUMBIA.

The directors of the Britannia Copper syndicate are reported to have decided not to accept the modified offer of \$900,000 in cash and stock which was made for their property by Bewick & Moreing of London. The Britannia group consists of seven claims on Howe sound, about 28 miles from Vancouver, discovered about eighteen months since. The showing of ore in sight is estimated at from 1,000,000 to 2,000,000 tons. The syndicate owns a seven-tenths interest in the group, and L. J. Boscowitz of Vancouver the rest. The bond expired on Friday, when the London promoters offered \$400,000 in cash and

\$500,000 worth of stock in a company to be formed with a capital of \$2,500,000, with a working fund of \$600,000 cash, but the directors have decided not to accept it. J. Williamson, F. Cottle and S. Coff, on their location on No. 2 creek, Windermere, have developed, by a 50-foot cross-cut tunnel, gaining a depth of 60 feet, 30 inches of solid galena ore and 3 feet of concentrating ore.

#### MEXICO.

M. Muller of the Banco de Sonora, Hermosillo, and W. R. McGuire of La Colorado, have bonded to J. L. Greene and associates of San Francisco the Buena Vista copper mine in the Gabilan country, about 40 miles east from Hermosillo, and work under the bond will begin at once.

#### THE KLONDIKE.

An energetic and progressive policy is promised by the Dominion Government in the Yukon under the new administration, so J. H. Ross, the new commissioner, states. Several matters of importance are to be immediately taken up by him, investigated, and reported to Ottawa for final action. Among these will be the granting of hydraulic concessions, royalty, the establishment of assay offices, and the question of gold dust commercially. The granting of concessions may be left to him. He makes the announcement that the new royalty regulation leaves the exemption clause just as it was under the old.

#### Personal.

R. C. GEMMELL has returned to Salt Lake City, Utah, from Mexico.

J. M. CALLOW of Salt Lake City, Utah, is in Silverton, Colo., on special work.

W. A. WILSON of Salt Lake City, Utah, recently returned from Morenci, Ariz.

F. McELERY of Eureka, Utah, has been appointed assayer at the Tip Top mine, Hailey, Idaho.

S. C. McCURE, Supt. Watsaka mine, Rochester, Mont., is sojourning in Salt Lake City, Utah.

C. A. MOLSON, consulting engineer for the Tom Boy and other mines, was in Salt Lake City, Utah, on the 20th inst.

JOHN CHAMPION, formerly Supt. Sheep Ranch mine, Calaveras county, Cal., is in British Columbia examining mines.

W. E. BRANDON of Denver, Colo., has been appointed Supt. Mulatos mine, Sahuaripa district, Sonora, Mexico.

F. E. SHEPARD, Pres. Denver Engineering Works, Denver, Colo., was in Salt Lake City, Utah, on the 17th inst.

C. H. MALLORY, M. E., is engaged in examining copper properties in Chihuahua, Mexico, for the London Ex. & Dev. Co.

A. GRAVES, M. E., of Denver, Colo., is now located at Carbo, Sonora, Mexico, opening a large copper mine near that place.

L. L. NUNN of the Telluride Power & Transmission Co. of Telluride, Colo., and Provo, Utah, was in Salt Lake City on the 15th inst.

DAVID ROSS, who has been superintending a mine in Oregon for several months past, has returned to Sutter Creek, Cal.

BUCKLEY WELLS, M. E., of Boston, Mass., who has been examining the Shannon copper mines at Clifton, Ariz., has returned home.

G. M. FORD, who has been in Ursa, Corea, for over two years, has returned to his home, Auburn, Cal. He expects to return to Corea soon.

G. S. ESTEY, of Latrobe, El Dorado county, Cal., has gone to Golovin Bay, Alaska, with a party of miners to open up mining property there.

FRANK P. SWINDLER, for two years Gen. Supt. DeLamar mine, at DeLamar, Nev., quit that position on May 10th and is now in Salt Lake City, Utah.

J. H. ROBERTSON, manager South Homestead mine, at White Oaks, N. M., has gone to his home, Scranton, Pa., on business connected with the mine.

BARNEY BARINDS of Spokane, Wash., goes to Cape Nome about June 1st to make an examination of the quartz properties in which P. Clark is interested.

P. J. DONOHUE of Salt Lake City, Utah, manager of the Sivrira Co. M. Co., has gone to the mines in Fuerte district, Sinaloa, Mexico, to start up the work.

J. H. OMERT, formerly Supt. Spenceville copper mine, Nevada county, Cal., has gone to Corea to remain in charge of mining operations there for three years.

W. E. BLAKESLEE, Supt. of construction of the Bully Hill smelter, Shasta county, Cal., for the Trent Engineering & Machinery Co., has completed his work and returned to Salt Lake City, Utah.

#### Obituary.

BENJAMIN THOMAS LACY, president of the Parke & Lacy Co. of San Francisco, Cal., died at his residence in this city on May 21st, aged 56 years. Deceased was a machinist by trade, and with Charles Burleigh, perfected the Burleigh air drill and air compressor. He was in charge at the Hoosac tunnel when these machines were put in there, and subsequently assisted in removing the Hell Gate rocks in New York harbor. He subsequently went to Europe with drills for the Mont Cenis tunnel and returned to put machine drills at work in the Sutro tunnel at Virginia City, Nev. Meeting there the late L. C. Parke, the firm of Parke & Lacy was formed, which has grown and extended till it now has branches in Australia and in London. Socially, Mr. Lacy was a man highly esteemed and respected by all who knew him.

#### Books Received.

Transactions of the Australian Institute of Mining Engineers, Vol. VII, 1901, 200 pages, is an exceedingly interesting and practical compilation of papers on mining in that country. It is an excellent illustration in recorded form of the close touch with each other of the advanced art of mining in all countries at the present time. Published at Melbourne, Victoria, by the Institute.

A Contribution to the Geology of the John Day Basin, by John C. Merriam, 45 pages, issued by the University of California as a bulletin of the Department of Geology, is a work of much technical interest to geologists. It does not consider the economic geology of the region. Both placer gold-bearing lodes are proving profitable for exploitation in some of the headwater streams of the John Day river.

Journal of the Western Society of Engineers, Vol. VI, No. 2, April, 1901, by the Society, 1734 Monadnock Building, Chicago, contains five papers of practical interest to civil engineers. "Factors which Cause the Decay of Woods," by Prof. H. Von Schrenk, will be interesting to miners by whom some cheap means of preventing the decay of timbers used in permanent mine openings is very much wanted.

Miners and Prospectors' Guide, revised third edition, published by James Irving & Co., Los Angeles, Cal. It is a handy pocket volume of 107 pages, containing in a compact, easily referred to form much general information that miners and prospectors find useful, and which it is not usual to find under one cover. Price 25 cents.

#### Catalogues Received.

Fraser & Chalmers Co., of Chicago and London, have issued the tenth edition of their catalogue No. 4 in a volume of 320 pages, profusely illustrated, and containing, in addition to minutely detailed explanatory text and specifications of their manufactures of mining machinery, explanations of processes and comparative costs of different schemes of ore treatment, briefly just what the mine owner wants to know in advance of constructing a treatment works. The catalogue can be had on application to Fraser & Chalmers, Twelfth St. and Washtenaw Ave., Chicago, Ill.

Advance Sheet No. 10 of the Jeanesville Iron Works Co. of Denver, Colo., and Jeanesville, Pa., illustrates and explains, in brief, comprehensive form, the mechanism and action of the Jeanesville triplex electric pumps which they are manufacturing.

#### Commercial Paragraphs.

G. P. KELLER is manufacturing his Keller balance at Salt Lake City, Utah.

J. GEO. LEYNER, manufacturer of compressors and air drills, Denver, Colo., has opened a branch at Salt Lake City, Utah, of which M. W. Winchester will have charge.

THE Saxton Steam Wagon & Automobile Co., whose works are at 515 Sixth St., San Francisco, Cal., is building a steam omnibus for Smith & Kuhn, Gray's Harbor, Wash. It is to run between Hoquiam and Aberdeen, a distance of 5 miles, and will carry thirty-six passengers.

THE American Engineering Works of Chicago has recently received a number of export orders for mining and industrial cars, to be equipped with their patent Anaconda wheels and axles. These orders have been from England, Japan, Mexico, British Columbia and Alaska. This company is also filling a number of export orders for shells for crushing rolls made from their special A.E.W. steel,

#### Latest Market Reports.

SAN FRANCISCO, May, 23 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 50c San Francisco, 48½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £69 12s 6d per ton.

The New Jersey courts have refused the injunction against the purchase of the Boston & Montana and the Butte & Boston by the Amalgamated Co., and the latter is arranging to increase its capital to buy them in. This result had been anticipated and discounted. London stock in sight is becoming very small, but the rate of consumption is not decreasing as traders there anticipated. The market conditions would indicate that there could be no immediate slump in prices.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco, \$4.90; carload lots, 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 2s 6d per ton=2.77½ cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton=3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 28c; 1000 lbs., 28½c; 500 lbs., 28½c; less, 29c; bar tin, \$3.32½.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.00 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15c.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb. small lots.

BISMUTH.—New York, \$3.25 per lb., 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb. lots.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, \$3.95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c per lb.

PLATINUM.—San Francisco, crude, \$22 per oz.; New York, \$22 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c per set; 14 oz., 40s., 9½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c per lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sks, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linsseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl.,

75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

#### New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MAY 14, 1901.

674,191—DRIVE WELL DEVICE—Allen & Grow, Eugene, Cal.  
673,995—PREPARATION OF RYE, ETC.—A. Bardet, S. F.  
674,131—FRUIT PRICKER—H. M. Barngrover, S. F.  
674,232—SEAMLESS TOOTH CROWNS—B. B. Brewer, S. F.  
674,232—SEAMLESS TOOTH CROWNS—B. B. Brewer, S. F.  
674,161—NOZZLE HOLDER—L. N. Brown, Los Angeles, Cal.  
673,977—OIL BURNER—J. A. Clark, Los Angeles, Cal.  
674,258—ROTARY ENGINE—T. Croston, Hoquiam, Wash.  
674,082—BICYCLE—Eastman & Sayer, Adams, Or.  
673,947—BEDSTEAD FASTENER—Gilham & Souder, Lagrange, Or.  
673,983—TROMBONE—E. Harrison, Los Angeles, Cal.  
641,115—WHEEL NUT—C. Hellrath, Sacramento, Cal.  
673,871—STEAM TURBINE—R. Hewson, S. F.  
674,008—LUBRICATING DEVICE—M. Kraker, S. F.  
674,119—SOLE—DGE TRIMMER—E. F. Maxwell, S. F.  
674,275—CUT OFF—A. W. Millen, Overton, Cal.  
674,115—DUST PROTECTOR—J. E. Ragsdale, Fresno, Cal.  
674,318—VEHICLE—J. Ray, Maxwell, Cal.  
674,284—FIREARM—G. A. Sachs, Eugene, Or.  
674,012—WINDMILL—A. M. Springer, Portland, Or.  
674,146—MAP—T. B. White, Portland, Or.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LUBRICATING DEVICE.—No. 674,008. May 14, 1901. M. Kraker, San Francisco, Cal. This invention relates to a device for containing and applying lubricants. It consists of a transparent containing cup, a cover fitting and locking thereon and having a central rod or pin extending inwardly to dip into the lubricant, and a means attached to the cover by which the device may be suspended at any desired or convenient point with relation to the machine upon which it is to be used.

PREPARATION OF RYE.—No. 673,995. May 14, 1901. A. Bardet, San Francisco, Cal. This invention relates to the deoctrification of rye and like cereals as a food product, and consists in first reducing the grain into small particles, then subjecting the particles to heat and agitation so as to separate the skin from the bran, and means for separating the bran from the grain.

STEAM TURBINE.—No. 673,871. May 14, 1901. Robert Hewson, San Francisco, Cal. This invention is designed to employ steam within a disk revolvably mounted upon an axle shaft having buckets formed upon opposite sides of its periphery, and fixed casings between which the disk is revolvable in close contact. Concentric rows of depressions are formed in the casings, with intervals serving to cut out the adjacent rows, and concentric chambers connected with the casings and subdivided with passages through which an elastic medium under pressure is admitted into the buckets of the disk whereby the latter is impelled, the medium being transmitted by the movements of the buckets from one set of casing apertures to the next adjacent one, so that it acts expansively within the next set of buckets and passages.

BICYCLE BEARING DUST PROTECTOR.—No. 674,015. May 14, 1901. J. E. Ragsdale, Fresno, Cal. This invention is an improved dust protector and consists of a cap having a central opening for the wheel axle, an annular offset or shoulder forming an outer portion which encloses the end of the hub, and a wide vertical flange extending radially outward and fitting a channel or depression in the sprocket wheel, but not in direct contact with the inner periphery. The surface of the sprocket wheel projects slightly beyond this disk, and thereby causes any dust to fall beyond the disk and not pass between it and the wheel.

**FOR SALE.****FOR SALE.**

The irons for a heavy pump bob, formerly used on 6-inch Jackhead pump, including cast bearing for elbow joint, with bolts and straps; cost \$160; will be sold for \$75 cash. Address IRA HILL REED, San Andreas, Cal.

**FOR SALE.**—1200 feet of 12-in. Steel Pipe, No. 14 gauge, in good condition.

Inquire PORT COSTA WATER CO., 326 California St., San Francisco, Cal.

### Valuable Hydraulic Mining Property,

located in Plumas County, Cal., containing 273 acres, title U. S. patent, water rights, ditches, etc., **FOR SALE AT A BARGAIN.** Terms easy. For further particulars, apply to ALMARIN B. PAUL, 27 Crocker Building, San Francisco, Cal.

**TO ASSAYERS.**

A fine set of assay scales with pulp balance, and set of assay ton weights, all in good order, will be sold for \$125. If applied for soon. The outfit consists of one Troemner's No. 5 balance with aluminum beam and agate bearings, mounted in glass case with sliding doors and plate glass bottom, original cost \$175; also one Becker's pulp balance No. 13, with 8-inch beam, mounted in glass case with sliding doors, costing \$26. Further particulars by addressing Box 4, San Andreas, Cal.

**FOR SALE.**

### ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

**MINES FOR SALE.**

Gold mine (2 claims), 165 miles from S. F. \$50,000.  
Gold mine (5 claims), Plumas County, Cal. \$75,000.  
Gold mine (3 claims), 166 miles from S. F. \$160,000.  
Gold mine (3 claims), 175 miles from S. F. \$250,000.  
Copper mine (40 claims), Arizona. Very cheap.  
All of the gold mines contain free-milling ore, are all easily accessible by rail and good roads, and are amply supplied with water and timber. They are offered at owners' bedrock prices, and are all good bargains.  
Full particulars given to parties desiring to purchase good properties. Any one or all of the above can be purchased from E. J. FRASER, 522 Parrott Building, San Francisco, California (sole agent for the owners).

## SECOND-HAND MACHINERY.

PULLEYS, SHAFTING, BELTING, BOXES, BOILERS, ENGINES, HOISTERS, STAMP MILLS, RAILS, CABLE—all but little used.

Sixth and Market Sts., DENVER, COLO.  
SEND FOR DESCRIPTIVE CIRCULAR.

**Special Meeting.**

OXFORD BETA TUNNEL AND MINING Company.—There will be a special meeting of the stockholders of the Oxford Beta Tunnel & Mining Company, to be held at the office of the company, No. 135 Geary St., Room 111, San Francisco, at the hour of 4 o'clock P. M., on the 4th day of June, 1901, for the purpose of increasing the capital stock of the company from twenty-nine hundred shares of the value of one hundred dollars each to one hundred thousand shares of the value of two dollars and fifty cents each. By order of the Board of Trustees. W. H. KNIGHT, Secretary.

**ANNUAL MEETING.**

The Regular Annual Meeting of the Stockholders of the National Cons. Mining Company will be held at the office of the company, 773 Mission St., San Francisco, California, on MONDAY, the 3d day of June, 1901, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

**Notice of Meeting of Stockholders.**

In accordance with the by-laws of that company, the Regular Annual Meeting of the Stockholders of the JAMISON MINING COMPANY, for the purpose of electing Directors for the following year and transacting such other business as may properly come before it, will be held at the office of the company, rooms 54-59, No. 120 Sutter street, San Francisco, California, at 2 o'clock P. M. on MONDAY, the 20th day of May, 1901.

SAM W. CHEYNEY, Secretary.

**BRITISH COLUMBIA MINES.**

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700, Nelson, B. C.

### WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgams, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

**THE S. H. SUPPLY CO.,**

### THE MACHINERY DEPOT OF THE WEST,

22d and Larimer Streets, DENVER, COLO.

During the past three months we have dismantled three mills: the Royal Gorge Mill, Canon City; the Oneida Reduction Works, Victor, Colo., and the Gold Brick Mill at Gunnison, Colo. The first of these was in actual operation less than thirty days; the second, ninety days, and the third one year. In all of these mills amalgamating machinery was used, and the consequence is that we have a great assortment of this class of machinery. For use it is as good as new in every respect. We are offering this machinery at a saving of from 50% to 75% over the cost of new machinery. We have:

- 14 Standard Amalgamating Pans.
- 7 8-Foot Settlers.
- 4 Cleanup Pans.
- 8 Amalgam Safes.
- 15 Quick Elevators.
- 4 Amalgam Cars.
- 5 Quick Tanks.
- 3 Retorts and Bullion Furnaces.

Two of these mills were dry crushing, containing the following roasting and drying machinery:

- Howell Improved White Roasting Furnace (60x37).
- 3 18-Foot Revolving Ore Dryers.
- 1 Bruckner Roasting Furnace.
- 1 40-Foot Pierce Roasting Furnace.

All of these plants were fully equipped with power, including Corliss engines (18x42); tubular boilers and Heine water tube boilers; feed water heaters, and pumps.

Thousands of feet of rubber and leather belting, shafting, pulleys and hangers are in our warerooms. Write for our prices.

The air compressors we have in stock and can make immediate shipment on, are:

- 12x14x14 Ingersoll-Sergeant.
- 16x14x10 1/2 Norwalk.
- 12x14 Rans.
- 10x12 Knowles Belt Driven.
- 6x8 Knowles Belt Driven.

Our new catalogue is just issued and we will send you one if you ask for it. It contains a large amount of good information in regard to prices, as all of them are put in plain figures. No discounts. Send for it.

THE CALIFORNIA DEBRIS COMMISSION HAVING received applications to mine by the hydraulic process from Charles Lilly and W. E. Emery, in the Avalanche Mine, near Vallecito, Calaveras Co., to deposit tailings in Grapevine Gulch; and from W. J. Cox and F. E. Keese, in the Taylor Diggings, near Taylorsville, Plumas Co., to deposit tailings in Hinchman Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on May 27, 1901, at 1:30 P. M.

# 120-Stamp Mill

At Hassel, Montana,

**FOR SALE.**

Will be Sold as Separate Items or Entire Mill.

Erected in 1897 by the Union Iron Works of San Francisco.

Only Partially Operated for a Few Months.

Guaranteed in Splendid Condition.

WILL NAME PRICES F. O. B. TOWNSEND, MONTANA, OR DELIVERED.

**SPECIFICATIONS (Condensed).**

- 2 NO. 5 McCULLY GYRATING CRUSHERS, with steel wearing parts.
- 26 ORE BIN GATES, 20" x 24", made of 1/8" steel plates, with racks, guides, boxes, pinions, shafts and hand wheels.
- 11 UNION CHALLENGE ORE FEEDERS, 11 right and 11 left.
- 11 10-STAMP BATTERIES. Stamps weighing 1000 lbs. each, arranged to be run in mortars of 5 stamps each, driven by belt and tighteners. Mortars especially arranged and designed for inside amalgamation, and weigh with apron 6500 lbs. each. (5 batteries never used.)
- 66 COPPER PLATES, 4' x 5', weighing 5 lbs. per square foot, plated with one ounce of silver per square foot.
- 6 OVERHEAD CRAWLS, complete with Norway Iron Hooks
- 2 4-WHEEL CRAWLS FOR CRUSHERS, with Norway Hooks.
- 420 LINEAL FEET 1/4 x 1 1/2 TRACK.
- 6 1-TON DIFFERENTIAL CHAIN BLOCKS.
- 2 3-TON BLOCKS FOR CRUSHERS.
- 47 UNION IMPROVED 4' VANNER CONCENTRATORS, complete in every particular. (29 never used.)
- 2 AMALGAM CLEAN-UP BARRELS, 28 x 36.
- 1 AMALGAM CLEAN-UP BARREL, 20 x 30, complete with tight and loose pulleys.
- 3 4' SWINGING BATTEAS and all fittings complete.
- 1 CAST IRON WASH TANK for clean-up work, 48 x 30 x 16.
- 1 HORIZONTAL 12" GOLD RETORT with all iron work complete.
- 1 SET OF IRON WORK FOR BULLION MELTING FURNACE.
- 1 MAIN DRIVING PULLEY, 78 x 23 1/2.
- 2 MAIN ROPE DRIVE WHEELS, 168", grooved for five 1 1/2" ropes.
- 1 LOT, being all necessary shafting, hangers, pulleys, belting, etc., for mill.
- 1 LARGE LOT OF PIPING, all sizes.
- 1 RAND DRILL COMPANY'S COMPRESSOR, 16 x 22, Class D, duplex (never used).
- 1 RANKIN & FRITSCH 16 x 42 CORLISS ENGINE.
- 1 HORIZONTAL RETURN TUBULAR BOILER, 75 H. P.
- 1 3-PHASE ALTERNATING CURRENT GENERATOR, 500 K. W., 60 cycle with 24 poles, type A. P., volts full load 2400, A. M. P. 120, revolutions 300, with rheostat.
- 1 ELECTRIC GENERATOR OR EXCITER, 12 1/2 K. W. Multipolar Direct Current Exciter, type M. P., class 4-12.5-12.75, volts 125, with rheostat.
- 1 MARBLE GENERATOR SWITCHBOARD PANEL, 30" x 90" x 2", containing one general field rheostat, one exciter field rheostat, one station transformer, one potential indicator, one current indicator, one pilot lamp, one ground detector with plug and receptacle, 3 type L lighting arresters, 6 feeder fuse blocks, one double pole exciter switch, two single pole switch brake 2000-volt switches, iron angle frame.
- 3 3-PHASE INDUCTION MOTORS, type "I," class 12-150-600, form "A," H. P. 150, cycle 60, volts 2080.
- 2 3-PHASE INDUCTION MOTORS, type "I," class 8-30-900, form "A," H. P. 30, cycle 60, volts 220.
- 1 3-PHASE INDUCTION MOTOR, type "I," class 10-50-720, form "B," H. P. 50, cycle 60, volts 2080.
- 100,000 FEET NO. 2 B. & S. COPPER WIRE.
- 1 LARGE LOT OF ELECTRICAL FIXTURES AND FITTINGS.
- 2 PELTON WATER WHEELS, 350 H. P. each.

## “THE DANIEL BEST”

## 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

**EVERY ONE A SUCCESS AND MONEY MAKERS.**

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

**THE BEST MANUFACTURING COMPANY,**  
San Leandro, California.

# CATES IRON WORKS,

650 Elston Ave., = CHICAGO, U. S. A.

It is now twenty years since we designed and began to build the GATES GYRATORY ROCK AND ORE BREAKER, since which time we have built nearly 5000 of these machines and set them at work in every quarter of the globe. The success attained by the introduction of this wonderful invention has been equaled by few triumphs in mechanical arts. We have constantly been improving the construction of the machine, and although in the lapse of time many of the original patents have expired, the Gates Breakers to-day are covered by more patents than ever before. We have continually been increasing the size of these machines until now we offer the public our size 9, weighing 150,000 lbs., having a capacity of **200 TONS PER HOUR**, and receiving masses of rock or ore weighing more than half a ton.

There are more than two hundred of these Breakers in the South African gold mines.

The Homestake Mining Co. of South Dakota, one of the largest mining properties on the North American Continent, paying a dividend every month, and having ore enough in sight to keep its 1000 Stamps busy for fifty years, uses

## 15 GATES ORE BREAKERS

and buys Gates justly celebrated Stamp Shoes in lots of 10,000.

We build every class of strictly modern

## MINING MACHINERY.

For instance: The Trail Smelters and the Granby Consolidated Mining & Smelting Co.'s plant were supplied by us, and they are the model smelting plants of British Columbia. We guaranteed a capacity of 500 tons per day in the Granby Co.'s two furnaces, while they average 600 tons per day, and have handled as much as 736 tons of copper ore in twenty-four hours.

Gates Mining Machinery is always a little better than it is guaranteed to be.

We build the following Specialties besides those above mentioned: **Stamp Mills, High Grade Rolls, Dryers, Roasting Furnaces, Hoists, Elevators, Screens, Concentrators of every class**, and, in short, every improved mechanical device for working and reducing the precious ores. We built the first Stamp Mill ever set up in the Rocky Mountains. Our manufacturing history covers a period exceeding sixty years. We publish seventeen booklets fully describing our

**MINING MACHINERY, CEMENT MAKING MACHINERY, ROCK AND ORE CRUSHING PLANTS,** Including Ballast and Macadam Plants.

## FAIRBANKS-MORSE GASOLINE-DISTILLATE GEARED HOISTER.

An efficient and reliable combination of a Fairbanks-Morse Gasoline-Distillate Engine on the same base with a Friction Hoist. Modern and up to date. We publish a special catalogue describing our Hoister which we gladly mail prospective purchasers.

## FAIRBANKS-MORSE GASOLINE-DISTILLATE ENGINES.

ALL SIZES UP TO AND INCLUDING 54 HORSE POWER.  
For Pumping, Milling, Lighting, Air Compressors, Etc.

## FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

83 FREMONT STREET, - - - - - SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with Asphaltum.

# CRUSHERS FOR ASSAYERS.

## SIMPLEX ORE CRUSHER.

### BRAUN'S ORE SAMPLE CRUSHER AND PULVERIZER.

HAND OR POWER.

A machine that crushes and pulverizes at one operation, re-

This is a compact, rapid and effective crusher. Cleaned and operated quickly and easily. All parts renewable.

Crushes from two inch to ten mesh. An ideal laboratory

crusher, as the parts are few; and as it is so readily cleaned,

there is no danger of salting subsequent samples. Made in two sizes for hand or power.

reducing an ore from two inches in diameter to a sixty or eighty powder. The ore is crushed against the upper jaw and pulverized between the vibratory jaw and the roll. Back motion of roll is prevented by small rolls or chokes. Easily adjusted and operated.

Write for our illustrated circulars of these and other labor-saving devices.

**F. W. BRAUN & CO., Los Angeles, Cal., U. S. A.**

Manufacturers of Improved Appliances for Assayers.

DEALERS IN GENERAL LABORATORY SUPPLIES.

# THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its  
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable. Will take ore from finest mesh up to 6-mesh without sizing. A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration. ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

DENVER, COLO., U. S. A.

### A ROOFING THAT LASTS.

P. & B. Ready Roofing will outlast any other known roofing. It is better than tin because tin sweats and rusts out; better than iron because iron draws heat, expands and contracts and eventually leaks; better than shingles because shingles warp and curl and then leak; better than slate because slate gets brittle, flakes off and cracks.

P. & B. Ready Roofing is made for roofing purposes and made right; it's made to overcome the faults of other roofings, and the fact that it is used on all the best buildings is proof that it is the best roofing.

Send for booklet. Address Department A.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

### THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1½ to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

## THE ROBINSON "WONDER" Placer Mining Machine.

The Greatest Placer Mining Machine Ever Invented.

Saves All the Gold, Even FLOUR GOLD. Requires Only Limited Water Supply. An Ordinary Driven Well Will Furnish All the Water Needed.

Capacity 2 Tons to 200 Tons Per Hour. A Machine That Has Stood the Test.

### READ WHAT OTHER PEOPLE SAY OF IT:

Mr. A. Y. Gordon, Elkhorn, Colo., April 26, 1901: "Your 'Wonder' Placer machine is the greatest gold saver I have ever seen. It saves the finest Flour Gold. With an 18-inch machine one boy and myself will wash 2 tons of gravel per hour."

From Mr. T. R. Andrews, Matape, Sonora, Mexico, April 12: "It is the greatest machine of its kind in existence. It saves every atom of gold and its capacity is truly marvelous." From the Johnson Assaying Co., San Francisco, April 13: "We have tested your machine thoroughly and are greatly pleased with it. It saves all the gold and is the best machine of its kind we have ever seen."

## POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.  
Send us your inquiries.

 Assayers and Mining Engineers.  
 Bullion Melted, Refined, Assayed and Purchased.  
 Price of Assays: Gold (crucible), 50c; Gold and Silver, 75c; Gold, Silver and Copper, \$1.50; Lead, 50c; Copper, \$1.00; Zinc, \$1.00.  
 Established in Colorado in 1876.

**ERNEST H. SIMONDS,**  
 Late Instructor in Assaying, University of California.

**ASSAYS AND ANALYSES.**  
**LABORATORY TESTS OF ORES.**  
 SPECIAL ATTENTION GIVEN TO THE INSTRUCTION OF STUDENTS.

**REMOVED TO LARGER QUARTERS**  
 at 417 Montgomery St., bet. California and Sacramento Sts., Third Floor, San Francisco, Cal.

**RICHARD A. PEREZ, E. M.**  
 Assayer and Analytical Chemist,  
 120 North Main St., - Los Angeles, Cal.

**ALMARIN B. PAUL, M. E.,**  
 Room 27, CROCKER BUILDING, SAN FRANCISCO.  
 Will act as AGENT for the sale of RELIABLE Mining Property. Also for securing suitable machinery for fairly developed gold mines in California, for interests in the same.

**RALPH E. STEVENS,**  
 ATTORNEY AND COUNSELOR,  
 43-44 Jacobson Building, DENVER, COLO.  
 Special attention to examination of titles. Corporation, commercial, mining law. Collections receive prompt attention. Notary in office. Refers to Denver representative of Mining and Scientific Press.

**C. M. HAMPSON, Mech. Eng'r.**  
**Ore Concentration Tests**  
**A SPECIALTY.**  
 DESIGN, ERECT AND REMODEL MILLS AND POWER PLANTS.  
 721 Seventeenth St., DENVER, COLO.

**School of Practical Mining, Civil, Mechanical and Electrical Engineering.**  
 Surveying, Architecture, Drawing, Assaying, Cyanide Process and Metallurgy.  
 113 Fulton St., one block west of City Hall, S. F.  
 OPEN ALL YEAR. A. VAN DER NAILLEN, Pres.  
 Assaying of Ores, \$25; Bullion and Chlorination Assay, \$25; Blowpipe Assay, \$10. Full course of Assaying, \$50. Established 1864.  
 Send for Circular.

**D. G. JEWETT,**  
 METALLURGIST AND ASSAYER.  
 Specialty: Mining and the Reduction of Ores.  
 ALMA, PARK COUNTY, COLORADO.

**W. H. W. HAMILTON,**  
 Consulting Mining Engineer,  
 SUMPTER, OREGON.  
 Correspondence solicited from parties desiring first-class mining propositions. Expert examinations of and advisory reports on any mining proposition. The development of mines by modern methods a specialty.  
 Moreing & Neal code.

**LETSON BALLIET,**  
 Mining and Civil Engineer,  
 Chemist and Metallurgist.  
 508 California St., San Francisco, Cal.  
 Special attention to treatment of low grade and refractory ores by all chemical and mechanical processes.

**HUDSON H. NICHOLSON,**  
 Consulting Mining Engineer,  
 Rooms 216 and 217, Boston Building,  
 DENVER, COLO., U. S. A.  
 Cable address: Aichen, Denver.  
 Expert examinations of and advisory reports on mining propositions.  
 Specialty: The chemical treatment of ores.

**CLARENCE HERSEY,**  
 Assayer and Chemist,  
 (Established 1879.) LEADVILLE, COLO.  
 Gold, Silver and Lead.....\$1.00.  
 Any two of above 75c; any one of above 50c.  
 Copper analysis.....\$1.00.  
 Platinum, Nickel or Tin, each.....\$5.00.  
 Twenty-one years successful experience in the mining metropolis of Colorado.  
 Write for mailing envelopes and price list.

**JAMES W. NEILL,**  
 Metallurgist and Mining Engineer,  
 Box 1164. Salt Lake City, Utah.

**ALFRED HARVEY,**  
 MINING AND MECHANICAL ENGINEER,  
 P. O. Box 971, DENVER, COLO.  
 Examinations and management of mines. Treatment of Ores investigated. Plans for mining, milling, and automatic sampling plants.

**U. S. Gov't Assay Office.**  
**A. L. PELLEGRIN & CO.**  
 Public Sampling Works  
 and General Assaying.  
 NOGALES, ARIZONA.

**LOUIS FALKENAU,**  
**STATE ASSAY OFFICE,**  
 538 Sacramento St., below Montgomery.  
 Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.  
 Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

**ABBOT A. HANKS,**  
 CHEMIST AND ASSAYER.  
 Successor to Henry G. Hanks, est. 1866. The supervision of sampling of ores shipped to San Francisco a specialty.  
 531—  
 California Street, San Francisco.

**J. W. RICHARDS,**  
 (Late of Aspen, Colo.)  
 ASSAYER AND CHEMIST. 1754 Champa Street, DENVER, COLO.  
 Ore Shippers' Agent. Write for Terms.

**E. E. BURLINGAME & CO.,**  
**ASSAY OFFICE AND CHEMICAL LABORATORY**  
 Established in Colorado, 1866. Samples by mail or express will receive prompt and careful attention. Gold & Silver Bullion Refined, Melted and Assayed OR PURCHASED.  
 Concentration Tests—100 lbs. or car load lots. Write for terms.  
 1736-1738 Lawrence St., Denver, Colo.

**SOLAR HOUSE LIGHTS**  
 For houses not having gas or electric light service, and for those that have, but wish economy and independence.  
 Costs \$4.00 Per Light  
**EACH LIGHT LASTS A LIFETIME**  
 Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A. B. C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.  
 Write us for particulars.  
 DISTRIBUTORS TO THE TRADE:  
**BULLARD & BRECK,**  
 131 Post Street, San Francisco, Cal.

**INVENTORS, Take Notice!**  
**L. PETERSON, MODEL MAKER,**  
 5444 MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

### The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

**A GOOD  
INVESTMENT.**

Three Dollars brings this paper  
one year—fifty-two issues. Can  
you afford to be without it?

See those wires--how they interlock.

Note the smooth surface also.

No displacement of wires in any event. Gives much greater service than other cables, and adds correspondingly to the life of the rolling stock.

—THE PATENT—

## THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

## THE BRETHERTON HOT BLAST.

APPARATUS FOR PYRITIC SMELTING. It saves fuel, increases capacity of furnace, improves character of work, does not require a hot top causing volatilization like other inventions, furnishes pure air heated without cost, can be attached to furnaces already in use, is an all around money saver, built and used by practical, successful metallurgists. Write for particulars to

THE BRETHERTON HOT BLAST SMELTING COMPANY, Mining Exchange Building, Denver, Colo.

## ASSESSMENT NOTICES.

**MOHICAN MINING AND MILLING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1901, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 300 California St., San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 14th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. CLASSEN, Secretary.

Office—300 California St., San Francisco, California.

**EUREKA CONSOLIDATED DRIFT MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of April, 1901, an assessment (No. 30) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 18th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEORGE W. DIXON, Secretary.

Office—214 Pine street, room 31, San Francisco, California.

**NATIONAL CONS. MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of April, 1901, an assessment (No. 14) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 778 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of June, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 25th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEORGE W. FLEISSNER, Secretary.

Office—778 Mission St., San Francisco, California.

**OSCEOLA CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of April, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of June, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

## THE KLONDIKE OF ARIZONA.

### THE Prescott and Eastern Railroad

ENTERS AN

Extremely Rich Mining Country.

The opening of this road makes easy of access one of the Richest Gold and Copper Mining Districts in the World. Hundreds of prospectors are turning their attention to this section.

Take the Santa Fe System to Ash Fork, thence via the SANTA FE, PRESCOTT & PHOENIX RY. to Prescott. This latter road also reaches Wickenburg, where is located the great Vulture Gold Mine and where the recent marvelous gold strike was made in the Oro Grande.

For further information and descriptive literature, address H. P. ANEWALT, Gen. Frt. & Pass. Agt., PRESCOTT, ARIZ.

## DELINQUENT SALE NOTICE.

**SOUTH SLIGER GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

## THE HALLIDIE ROPEWAY

For Transporting Ore, Fuel, Earth, Sugar Cane, etc., by Wire Ropes.

SIMPLE, ECONOMICAL, PRACTICAL, DURABLE.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY.

WIRE TRAMWAYS (Single and Double Rope Systems),

CABLEWAYS, TRANSMISSION BY WIRE ROPES, CABLE GRIPS,

INCLINE PLANES, LOGGING BY CABLES, AUTOMATIC LOADERS,

PLOWING, SCRAPING AND TRANSPORTING by Wire Ropes,

DESIGNED, SUPPLIED AND ERECTED. Estimates Furnished.

AGENCIES: Hendrie & Bolthoff, Denver, Colo.; Scott-Strevell Hardware Co., Salt Lake City, Utah; George A. Lowe Co., Ogden, Utah; P. Basche, Baker City, Oregon.

CALIFORNIA WIRE WORKS,

## Improved GRIP PULLEY.

Patents Nos. 488,442; 610,868.

EFFECTIVE, SIMPLE, AUTOMATIC.

Saves Wear on Wire Rope and Cable.

Send for Illustrated Pamphlet.

Correspondence Solicited.

## The Silver King Mill, Utah.

The Silver King mill at Park City, Utah, is a fine example of modern mill construction. It has operated continuously since its completion, making a jig product that runs about 55% lead and a table concentrate that runs 45% lead. Five grades of jig product are made. The vanner room contains six Frues and six Wilfleys. The general mechanism of the mill was described in this paper in March, 1900. Since then a new feature has been devised and put into practice for saving values from the finest class of slimes. It consists of eight triangular settling tanks, each 5 feet high by 60 feet long, which receive the slime water from the jigs and tables, the fine particles settling at the bottom, from which they pass into slime presses, where the material is submitted to eighty pounds per square inch of compressed air. After the pressure is through with, the slime product is taken from the presses in the form of circular slabs, which are absolutely free from grit, and which carry high values in gold, silver and lead that a few hours before floated in suspension in water. In April a shipment of 225 tons of this product was made. It is claimed the values thus saved from the slimes amount to enough to pay all expenses of operating the entire mill.

The mill receives and treats 70 tons of ore per day, about 125 tons per day being shipped to the smelter direct. Most of the ore is a carbonate, with bunches of galena in places. Recent shipments from the 1200-foot level ran high in gold, silver and copper.

Near the mill is a new sampling plant, provided with automatic equipment throughout. It has four receiving bins, 250 tons capacity each. There are three sets of rolls—36x12, 30x10 and 24x8 inches; also four samplers. Five steel-legged elevators carry the ore after sampling to the shipping bins. The crude ore passes through chutes from the receiving bins to Robins conveyors, the latter delivering it to the crushers.

A new Finlayson wire rope tramway line, furnished by the Mine & Smelter Supply Co., has been erected to convey the ore from the sampler to the shipping

The Silver King Concentrating Mill, Park City, Utah.

bins at the railway in Park City. It is 7000 feet long, erected on steel towers, the line carrying buckets of 750 pounds capacity each. The mill and sampler are under the superintendency of J. B. Fleming, who planned their construction.

## Turbine Water Wheels for McCloud River, Cal., Power.

Among the enterprises utilizing the power of the

falling water of the mountain rivers in California is the McCloud River Electrical Company of San Francisco, which is developing a portion of the power available from the flow of the McCloud river, which has its source in the snows on the summit of Mount Shasta. The power developed it is proposed to transmit to the copper mines and smelters of Shasta county and to other mines and industries.

For the development of the water power the company is installing four units of Victor turbines, manufactured by the Stilwell, Bierce & Smith-Vaile Co., of Dayton, Ohio. These turbines (see illustration on this page) are equipped with "cylinder gate" mounted on horizontal shafts, each unit to develop 790 H. P. under 36' working head of water and running 270 revolutions per minute. Each unit consists of two 30" Victor turbines, mounted in a steel flume and discharging into one central-draft tube. The flumes are 15' 9" long, 9' 6" diameter, constructed of heavy steel plate with cast iron heads and covers. The gate work is the "patented draw-rod" type, which places all gears on the outside of the flume, where they can have attention and where they can work in oil, doing away with the old style of gate work where the gears run in water.

The wheels are set on top of concrete arches, the draft tubes reaching through to the tail water below. Each unit is equipped with a large rope pulley, and the dynamos are driven by means of rope drive, the dynamos being located at a higher elevation than the water wheels. The feeder pipes come through the foundations upon which the generators set.

There are two exciter water wheels (see illustration page 250) which will develop about 40 H. P. each under 36' head, and the exciters are also driven by means of rope pulleys. The large units are each equipped with a Giesler electro-mechanical governor for regulating speed.

GOLD, of all products of man's industry and thrift, is apart from the rest as the one product that takes care of itself. It does not have to wait in a market for a buyer, it does not have to go in search of a market. It is its own buyer, its own market, and its market is where it is. It is always worth \$20.67 an ounce for an ounce of it is always itself the \$20.67.

DEARLY BOUGHT experience seems to have satisfied foreign capital that Siberia is a poor country for mine exploitation by others than Russians. Russia is perfectly willing to have the foreign capital, but only permits it in Russian companies, and reserves the control to Russians. The Government, mine owners and people have absurdly exaggerated ideas as to the value of their placers, are extravagant and incompetent in management, and burden the business with costs and royalties that make profit impossible, even with very rich ground. At the same time, Russians do very well with these same placers when mining on their own account. They are good prospectors, and confine their losses to prospecting, not mining any ground that will not pay extraction costs.

THE California State Mining Bureau has announced that registers and maps of mines of several counties are ready for distribution. The preparation of these publications was doubtless well intended, but the execution is a weak spot in the otherwise excellent record the Bureau has made of work valuable to the mining industry. The data was gathered in the field two years or more since under limitations, or, more truly, under no limitations, which makes its publication practically worthless from an economic standpoint. The text accompanying the register mainly says, in effect, that the data was gathered and published in such a manner as not to injure the repute of any mine; which is clearly quite true, and it is just as obvious that the data does not help the repute of any mine. The registers, however, are quite misleading to manufacturers and dealers in mining apparatus and supplies—the only people who could find the register useful. They do not know, and cannot be expected to know, the local peculiarities of California mining and mines, and will give to the lists of mines an importance entirely out of proportion to the facts. To that extent the publication is mischievous. The unpublished data of other counties should not be published. There are useful purposes to which the saving can be applied. There is ample field for the Bureau activities without doing over poorly what the U. S. Geologic Survey has already done very well.

## The Line of Least Resistance.

It is at this writing two months since the California petroleum producers found themselves squarely up against the condition of a market in which there was more petroleum offered on sale than there was consumption to buy it. Sale prices then dropped so low that the future earnings of the business, which the oil company promoters had capitalized and sold to the public, apparently disappeared. Of the low sale price of oil, the fixed cost charge of railroad transportation was then by far the larger part of it. Immediately the producers appealed to the State Railroad Commissioners for lower freight rates. It seemed the quickest way to the mass of the producers by which to be able to have again the profits that low prices had caused to disappear. Instinctively it was taken by them as the line of least resistance. Nevertheless, the freight charges are undiminished and the sale price of oil is still low.

Later, other of the producers, appreciative of a weak point in the "instinct" action, and who grasped the simple, direct fact of the condition—more petroleum for sale than buyers for—met the simple, direct fact by an equally simple, direct action in the opposite direction. They proposed to reduce the amount offered for sale. They called it something else, but that was what their action meant. They have organized a producers' buying company which should take over all the well production and fix sale prices high enough to make a desired profit without restricting consumption. This action is believed to be the application of reason, in contradistinction to instinct, in securing the profit of the producer on the line of least resistance.

Here suggestion of action from the people of the industry rested. Nothing more has really been offered. Suggestions of pipe lines are only a modification of the first line of action—lowered freight costs.

Looking analytically at the first instinctive suggestion of lowered freight rates, it is seen in truth to be nothing but an attempt to pass the loss off on some one else. It was clearly inspired with the idea that what was taken off the freight would go into the profit of the producers. It is quite as good a try at the desired end as is the action of the ostrich who puts his head in a bush to hide from his pursuer. Suppose the freight rate be lowered, it does not increase consumption nor decrease delivery to the market. The producer whom it is desired to help is not helped, the consumer who does not ask lowered prices gets them. The railroad loses an earning without benefit to the people who ask it. And these results are quite independent of the existing freight rate. Evidently when reason is applied the instinctive action of the producers who would meet this particular condition by reducing freight rates is not on the true line of least resistance on which to obtain relief.

Examining analytically the second suggestion of applied reason it is seen to be a more reasonable attempt to cure the disease than that offered by instinct. The head of the house, instead of giving the cat the medicine for madam's illness, takes the medicine himself. The producers in organizing a trust, or community of interest—it is the same fact—to maintain the sale price at a profit point, are restricting production and denying to themselves all the possible profits their industry could legitimately earn. The individual producers sell to themselves associated all their oil product, but "all" must mean a maximum of the pro rata of the total consumption, not the maximum of their possible production. They must, supposing they do not limit their own production, prevent production by new comers in the industry. The essence of their kind of action through all the disguises of language is limitation of production—which limitation must be paid for by the producers in the aggregate either directly or indirectly, and which payment reduces the profits sought by the proposed action. This is on the theory that the limitation is financially carried by the producer. If it is not, it is inevitable that the present loss is only postponed, compounded, and made the loss of all the producers instead of the weaker only as under a continuation of present conditions.

Whatever then can be said of the courage and straight-forwardness of the producers in undertak-

ing to carry the load of overproduction of petroleum, it is indefensible as business. The reason that promotes it is as weak in conclusion as is the instinct that wants for the same trouble a reduction in railroad freight rates. The line of least resistance is not in limiting production artificially.

Right here, where those newspaper advisors who have fattened on the growth of the oil industry, which the technical advice of this journal assisted into being, have quit, we would suggest:

Suppose now that since neither forcing the railroad to take the load of the loss of the petroleum business, nor restricting the production, will make profits, that the medicine be given to the third party, the consumer. This means simply that consumption be increased, so that demand is in surplus instead of supply. Suppose consumption to be increased, is not at once the lost profit restored independent of freight reductions or combinations of producers limiting production? The consumer has not from necessity demanded a lower price than that which existed before the drop. Consumption is not contingent on a lower price, and a lower price has not increased it. Mentally passing the seeming contradiction for a moment, it is safely to be stated as conclusive that increasing consumption of petroleum would increase the present sale price to the old figures without requiring reduction of freight charges or limiting production by forcing association of producers. Clearly the line of least resistance is, then, increasing consumption of petroleum.

That being determined, there is only to be ascertained the means of making increase. Increased consumption will come from more uses and more users. As suggested, the sale price has not been the difficulty here. It is really what may be described as the inertia of established business. What consumers actually buy when they buy coal or oil or gas is heat and light and power. The first three are raw materials, the latter three are directly consumable products. The consumer of the first three is really first a manufacturer of the last three, then their consumer. Take as the economic fact that heat, light and power can all be manufactured cheaper from oil than from coal (gas is really an intermediate stage between the coal or oil and the heat, light and power). Accept the commercial fact that despite the cheaper manufacture for oil, the inertia of the established business resists the change from coal as a raw material to oil. Then flank the commercial barrier by offering to the consumer direct what he himself has heretofore manufactured from the coal, heat, light and power. Particularly heat. Light and power as finished products sold are familiar to consumers and part of the market is occupied, but heat, probably the largest commercial use of the three, is the least sold directly.

Take the capital which the producers are concentrating in their association to use negatively, and use it positively to bring the same end. Use it to provide the means to convert oil into heat, light and power, the means to transport them as such to the consumer, and then sell to the consumer heat, light and power.

Do the manufacturing at the nearest point to the oil-producing wells. Sell in the nearest market or to the nearest consumers. The means of carriage for the heat, light and power is electricity. Such transmissions are commercially made in this State over 160 miles of distance between the points of manufacture and consumption. The distance limit of commercially economical transmission has not been reached yet. It is safe to assume that it exceeds 300 miles. This latter figure would connect the Bakersfield petroleum wells with San Francisco. There is no more physical or commercial difficulty incident to the manufacture and transmission, electrically, of heat, light and power from petroleum as the raw material than there is from falling water as the raw material.

Details are a matter for the engineers and petroleum producers. This is only intended as suggestion pointing out the true line of least resistance. Summarized, that suggestion to the oil producers is: Offer to consumers of heat, light and power not the raw material, oil, but heat, light and power direct. Make these last at the oil wells and distribute from there by electricity. Induce particularly the direct use of heat in electrical heating devices for domestic

service. The direct use of petroleum in domestic stoves and furnaces would increase consumption, but it is a much less safe and simple affair to the consumer than pressing a button.

The conservation of the energy of fuel into electricity at the point of production of the fuel is not new. It has been proposed for the English coal mines. It has been proposed for using peat bogs in Germany. The business reasons that made the propositions possible there make the proposition of conserving the petroleum here into electricity possible. The inertia of an established business in this country is a trifle to what it is in England and Germany.

Let effort to make profit be initiated on this line and it is possible to have the financial union of all the producers of petroleum behind it, and as well the assistance of others who hope to produce petroleum. The manufacturers and dealers in electrical supplies and appliances would join in it. There would be no business interest that would financially oppose it. To so increase consumption is the line of least resistance for the oil producer.

### The Old California Way.

The mischievous litigation which has accompanied the discovery of gold in the Nome district of Alaska is again prominent in the pardoning of McKenzie, the Receiver of the U. S. Court at Nome, around whose personality the major part of the difficulty originated. The law has been vindicated—but at the loss of much time and at the cost of much of the profit of the mining of the gold in the claims.

John T. Davis, in his History of the Mining Laws of California, quotes some old records of early day mining law in California that illustrate that all the economics of mining are not the invention of the last few years. The beginners in mining seem to have known how to economize time and save legal expenses. Mr. Davis says:

One of the most instructive records of miners' meetings is that of the meeting held Dec. 13, 1853, in the Weaverville district, in Trinity county:

Dr. Ware explained the object of the meeting in a few pertinent remarks. He said that McDermot told him on yesterday that unless he gave up one-half of the water in the creek aforesaid, that he, McDermot, would take a body of men and take the water by force of arms and hold the same until he and his men were whipped off the ground. His party as above mentioned have taken possession of the water, and are holding it by force of arms. In this dilemma Dr. Ware calls upon his fellow miners to assist him in defending his rights, agreeable to the old miners' laws. They said that this was a serious affair, but they were willing to defend the old and established miners' laws and the right.

A committee of five was appointed to investigate the nature of the grievance and examine the law on the subject, and a recess taken. The minutes then proceed:

Pursuant to adjournment meeting met at 1 o'clock, were called to order by the chairman, Mr. Cameron. Committee reported as follows, having thoroughly investigated the laws and customs of the miners at Weaver: We fully concur in the opinion that Dr. Ware is fully entitled to all the water in West Weaver, except four tom-heads, which is allowed for the bed of the stream; also that the burning of his reservoir, and the destruction of his dam and other property and the taking of his water from his race by force of arms are malicious acts, and should not be submitted to by those who are in favor of law and order.

On motion, the report was received and the committee discharged.

On motion, it was "Resolved, that we assist Dr. Ware in turning the water into his race, and that we sustain him to the last extremity in keeping it in the race."

On motion, the meeting then adjourned for the purpose of carrying this resolution into effect.

With the restoration of stable industrial and governmental conditions in the far East, Corea is attracting attention for gold mining, both placer and quartz. Many Californian miners are going there under contract. The opportunities for capital and the chances that it will be permitted to earn mining profits are better in that land than in Siberia. There is practically no governmental regulation. Royalties are collected by the local mandarins and are not high. Corean labor is physically more efficient, and more tractable, than either the Siberian or Japanese. The mining area of the country is the central interior plateau, and the northern end adjoining Manchuria and the Siberian province of South Ussuri. The climate is about that of Maine and Nova Scotia. Transportation facilities are still backward, but improving. Gold exports in 1897 were about \$4,000,000.

### Concentrates.

PITTSBURG REDUCTION CO., Niagara Falls, N. Y., are buyers of aluminum ores.

JAPANESE gold placers in 1900 yielded about \$600,000. The copper production was 27,840 tons, being the third largest in the world.

THE majority of cam shafts are made of wrought iron. The practice of makers differs. Steel, being cheaper, is frequently used for these shafts.

TROLLEY FREIGHT CARS are coming into use all over the United States and are proving a great convenience in expediting the delivery of local freight and express packages.

A FLUME made of rough boards 10 inches wide in the bottom, 8 inches depth of water on sides, with 1 inch fall to 12 feet, will deliver 2.2 cubic feet per second, or 88 miners' inches.

THE new law increasing the extent of a placer mining location in Atlin district, B. C., goes into effect about July 1st of this year. It permits the location of claims 250 feet square.

THE placer gold taken out of the beach diggings at Yukatat and Lituyu bays on the Alaskan coast is very probably due to the wave and tidal concentration of poor glacial deposits.

TOO great heat in retorting will soften the iron of the retort and some fusion of its inner surface in contact with the bullion will cause it to receive a considerable impregnation of the latter.

THERE is no definite distance above the surface of the water in a mortar from which the drop of the stamp creates a splash which wears the chuck block. The narrower the battery the less the distance must be.

RETORTING will destroy most of the grease fouling quicksilver. It is better to distill over the last tenth of the metal separate from the rest. A washing with lye will remove grease from quicksilver on battery plates.

AT the Robinson mine in the Transvaal the cost of crushing the ore in the rock breakers is 13.5 cents, the stamp milling costs 57.5 cents, the concentrating 9.5 cents, and the cyaniding 72 cents, a total of \$1.525 a ton.

THE law passed by the last California Legislature raising the incorporation fees cannot be avoided by incorporating outside of the State, foreign organized incorporations must pay the same fees when they undertake to do business in the State as if they had incorporated there.

THE outlet to a reservoir should preferably be a tunnel through the solid ground alongside of the dam. A trunk through a dam is poor practice. It is hard to protect it against leaking and against the weight and more or less uneven settling of the dam when it is built of earth.

THE best way to keep a mine pump operated by compressed air from freezing is to reheat the compressed air in the mine close to the pump. Not only will the difficulty of freezing be removed but there will be a large gain in efficiency. The reheating is comparatively inexpensive.

IN a method of welding copper lately described the copper is treated with potassium nitrate and a cyanide, after which it is welded to itself or to iron or steel in the same way that iron is welded in a blacksmith forge. The temperature of the copper wants to be considerably below a white heat.

THE Commissioner of the Land Office has recently made a decision in a land case in Washington reaffirming the principle on which the Secretary's decision in the oil land cases in California was made. Land must be vacant unoccupied land to permit of its being made a lieu land selection.

STEEL has a tendency to assume the crystalline state under vibration sooner than wrought iron, but not as soon as cast iron. The crystallization of the carbide of iron present in steel and cast iron seems intimately connected with the phenomenon of crystallization. Cast iron has more of this than steel.

THE secret of the cheapness of American manufacturers is claimed to be, partly at least, in the interchangeability of parts of every mechanism, in the standardizing of constructions. A mechanical invention in this age is not complete till the machine tools to make it in interchangeable parts have been invented.

GOLD in lode deposits is very often found coated with iron oxide so as to be unamalgamatable. This is the case where the coating is only a transparent film. Break it at only one point and the gold will amalgamate. The rubbing and grinding machine employed in early day gold quartz milling were devised to meet this condition then supposed to be all but universal.

A DECISION of the United States Supreme Court just made in a Cripple Creek, Colo., case, the Calhoun M. Co. against the Ajax M. Co., can be considered as finally establishing the principle that the ownership of all lodes or veins apexing within a legally established mining claim belong to that claim irrespective as to whether they are cross or parallel veins. Between two conflicting locations the senior in time takes all the veins apexing within the conflicting area.

IMPROVEMENTS in methods and machines effecting magnetic concentration have extended the number of

ores and minerals it can be applied to. In addition to the separation of iron ores from gangue and between themselves, compounds of titanium, tungsten, nickel, cobalt, manganese, copper, lead, silver and tin ores and some sulphide of zinc and bismuth compounds can be separated.

THE solution commonly used in silver plating is nitrate of silver prepared by taking four parts of the strongest nitric acid with one part of water and adding pure silver till no more is dissolved. The solution should be kept in a dark place. Cyanide of gold is used in solution in gold plating. The gilding of the inside of a silver vessel is done by filling the vessel with the solution and suspending it in a gold anode.

THE mining laws do not require an annual expenditure or assessment work on a mill site location. A mere claim without mill improvements would not, however, be valid as against a mill site claimant who did actually construct a mill. With a mill once on a mill site possession can be maintained even if the mill is not operated. One of the California courts has decided that the payment of taxes is vital evidence of possession.

EXPERIENCE in sub-aqueous tunneling goes to show that the principal dangers of water lie in the approach tunnels under the land, and not in the portion under the bed of the water channel. In the former the crevices and fissures remain open, those above the level of low water being water channels, while crevices in the sea bottom have for ages been gradually sealed up by sea deposits under heavy pressure, which would drive out air and water and tend to the caking of all joints.

THE most accurate method of determining the quantity of water that will be contained in a reservoir made by damming a valley is to survey the water level contour lines of the land within the reservoir site. The contours surveyed can be for successive intervals of depth over the outlet 3 or 5 feet apart. These should be platted and unsurveyed contours interpolated by proportion to make 1 foot differences of level. The successive areas can be calculated in square feet, using a planimeter. The sum of these successive areas will be the content capacity in cubic feet. A roughly approximate estimate can be made by determining from a survey of the contour of the highest proposed water level the full floodable area in square feet and multiplying it by two-fifths of the maximum depth over discharge.

WITH shallow surface developments on a lode deposit it is rarely good judgment to run a long costly tunnel to cut the lode at a great depth. The Mexican miner's way, though not pretty, is generally satisfactory in returns. His method is to follow the ore values with his mine openings, turning his shaft or winze or tunnel as the ore body changes its direction. With shallow surface developments there is nothing certain on which to predicate the direction or the continuity of an ore shoot developed by a surface cut or shallow incline. It is much safer to gain depth by successive steps. Just how much at a time is a matter for judgment in the particular case, but it is safe to say that 200 feet is ordinarily an outside figure for the first gain in depth sought by a tunnel. As the direction and continuity develop, greater depths may be taken by successive tunnels without increasing the chances against success. To tunnel to cut a lode a thousand feet below surface works only fifty or so feet deep reads nice, but it is not mining.

PLACER mining dredging is not precisely the same operation either technically or commercially as dredging navigable waters. In dredging gold-bearing gravel the removal of the material is a secondary object to the winning of gold. If the ground is in places too hard to repay from its probable gold content the cost of taking it out it is left in place. No fixed depth and width have to be dredged as is the case with dredging of navigable waters. The deposit of the spoil is to greater distances requiring auxiliary plant and labor in the case of the navigable water dredging. With the latter commercially the profit earning has to be provided for and the element of risk discounted in advance and special conditions of each piece of work modify contract prices. There is nothing inconsistent in the flat operative cost of placer mining dredging being 12 cents a cubic yard and a contract bid of 20 cents per cubic yard for dredger excavation in navigable waters. It is very doubtful if placer dredging has been done for 2 cents a cubic yard; 5 cents would be a very satisfactory result.

Few diamond drill bores go down in a perfectly true vertical course. There are usually several slight bends or curves away from a straight line, and if the boring is through highly inclined strata the deflection may carry the end of the hole 50 feet or more away from the vertical line. A method of determining the extent and place of this deflection has been invented in Australia. The instrument, which the inventor calls the clinograph, consists of a number of clear glass phials nearly filled with a hot solution of gelatine, each containing suspended freely in the gelatine a magnetic needle. These are covered with brass cases and let down in the bore to a fixed depth. They remain there undisturbed several hours till the gelatine has set, and meanwhile the needle fixes itself in the meridian. On withdrawal the phials can be replaced at the same angle they had in the bore by bringing the surface of the gelatine to the horizontal, and the bearing of the bore can be taken by putting the needle in the meridian. From several such operations at a sufficient number of points the course of the bore hole can be platted.

## Elements in the Design of Roll Crushing Plants.

Written for the MINING AND SCIENTIFIC PRESS by JESSE SCOBEE, Denver, Colo.

While the use of rolls for coarse crushing has always been considered good practice, it is only in the last few years that their use in fine crushing has been acknowledged feasible, and their work a success. This is mainly due to the fact that in coarse work the range of adjustment below the point necessary to crush to the desired size is large, while in fine work it is small, consequently the limit of the work that the roll will do is more pronounced, and disappointments were more frequent from the great expectations sown by some makers in the recommendation that the capacity of the rolls is practically unlimited. The fallacy of this assertion yields to easy solution, both on paper and in practice. According as the limit of the capacity is approached more care must be taken in the details of installation and operation. The simple computations to be made in the design for the crushing department of an ore-dressing plant are frequently overlooked. You are led to believe from the discussions heard in most milling circles, that the poor work of a machine at a certain mill is due to a defect inherent in the machine and not in its installation. Of course this idea is abetted by the local man who put the machine in place. This conclusion is frequently deserved, as too often the mill man is forced to use an article as supplied from some machine house, because the representative is a good fellow, and "a good turn is due him," or, maybe a heavy stockholder is connected with that house, however, there are places for all machines. All machines are not good in one place, nor is one machine good in all places. Where other plants are profitably working in the same district, it is wise for a new mill to keep on similar lines. Undoubtedly the subsequent treatment must largely decide the class of machine for the final comminution of the ore, and for the same treatment a hard or soft ore may employ widely different principles in their economic breaking, but when this question is decided for you, or forced on you, the success or failure of the machine installed may be foretold by the size chosen, the speed to be given it, the design of its accessories and the care with which it is put in place and operated. The extremes in this case are found in rolls, and their error more apparent. The rule of thumb and the catalogue man are especially prominent in installations of this kind. In coarse work they must try hard to fail. Fine crushing with rolls, however, is a modern accomplishment and the work of the roll is often depreciated as the result of the unbalanced parts of elevator and screens, size and feed, or in the careless adjustment of speed. It is only of recent years that fine crushing has been studied, and in some regions it is even yet little understood. The larger machine houses have brought out important improvements and refinements in their rolls to meet the growing tendency to use them in fine work; a radical step is to omit springs altogether, to give a positive force to the blow, as it is to be supposed that all metal has been previously screened from the pulp.

The diameter to be chosen is commercially limited among the wide-faced rolls by those carried in stock at mining centers; the larger diameters to be used on coarser work on account of their greater nip, the smaller on fine for lessened expense of installation and repairs, though run at greater speed to get the same or higher peripheral speed.

To avoid crowding or choking the peripheral speed must be greater than the velocity of the falling stream of ore. This may be determined by applying the law of falling bodies—

$$V = \sqrt{2gh}, \text{ where}$$

$V$  = the velocity of the body.

$h$  = the height or distance the ore falls.

$g$  = the force of gravity.

To find  $h$ , measure the vertical distance from the center of the rolls to point on feeder or launder from which the ore has an uninterrupted fall into the roll; for a 27" roll this may be in many cases about 3 feet, therefore,  $v = 64.4 \times 3 =$  approximately 14' per second, or  $\times 60, 840'$  per minute.

The circumference of the roll shell is  $2\pi r$ ; for a 27" roll the circumference is  $3.1416 \times 27 = 7'$ . The revolutions per minute of the roll would then be at least  $840 \div 7 = 120$ .

It is economical to keep  $h$ , the height, as low as possible, and where size or conditions of heating in bearings make a lower speed essential the problem should be reversed, and, with a known speed the height of fall should be determined. This simple calculation may be easily applied and may explain a tendency to choke or an excessive cheek-plate wear.

The actual speed of the roll should of course, in the above case, be slightly greater than 120 revolutions, probably 125, as it is important to remember, especially in wet crushing, that there is a velocity of approach, and it must be taken into account, otherwise there will be a wash around the sides.

The capacity of rolls at different speeds for differ-

ent meshes is a matter of computation, the results from which may be plotted to very handy curves; the important feature, however, is not to overlook the returns, which are variable with different ores. Consider the case of grinding to 30 mesh, on a hard ore; it is impracticable to space the rolls to a certain mesh; the best that can be done is to set the rolls to touch evenly across the face, to lock them in this position, and then put the required tension on the springs. In any case the tension must be held static in the tension rod and must not be conveyed to the roll bearings by having an initial pressure between the shell faces. The pressure on the bearings must only come into play when calling out the reserve energy of the springs, or must only just equal the pressure required to crush the rock, but taken theoretically, for the case of 30 mesh, the shells should be about  $\frac{1}{3}$  of an inch apart, as the mesh opening of 30 mesh is  $\frac{1}{30}$  of an inch, to which 5% should be added, or more properly deducted, in order to allow for the probable easement of the springs when working at a full load. Using the average standard size of the machine house, a 14" x 27", the 14" shell will have about 12" effective line of contact; the area at the line of least section would be  $12" \times \frac{1}{30}"$  or  $\frac{1}{2}$  square inch; at 125 revolutions previously developed, the peripheral speed will be  $125 \times 7 = 875'$  per minute and  $875' \times 12" \times \frac{1}{30}" = 1750$  cubic inches per minute, or 105,000 cubic inches per hour, or approximately, 61 cubic feet per hour, as the total maximum cubic contents that can possibly be crushed and passed between the shells. Allowing 20 cubic feet of ore to the ton as an average, we may deduce that practically only three tons per hour, or seventy-two tons per twenty-four hours, may actually pass through the roll. This, however, is not the capacity, as the returns must be considered.

From daily tests, covering one month's continuous work at the Avino mill, I found the average results from two rolls working side by side on divided streams of the same ore, both grinding to 30 mesh, for thirty days, to be:

Of the pulp that had been previously screened and treated and relieved of the 30-mesh undersize, and going to the rolls, 88% was over 30 mesh, or 12% was already under 30 mesh.

Of the pulp discharged from the rolls, including the reground returns, before going to the screen, 50.1% was now over 30 mesh, or practically 50% of the pulp was capable of passing a 30-mesh screen, but of this same pulp, after screening on a 36" x 60" trommel running twenty-two revolutions per minute, the oversize returning to the rolls contained an average of 73% over 30 mesh, or 17% that passed the 30-mesh hand test screen, that did not pass the 30-mesh trommel.

The first figure is only interesting, but the last two useful in the present. Applying this experience to the above problem, there is 17% of the original 49.9% undersize that is returned, or 8.5%, this, plus the 50.1% gives 58.6% of the pulp that has passed the roll as returning as oversize, so only 41.4% of the total 72 tons that may pass the roll is available as new feed, or actual capacity of the rolls, or 29.8 tons per 24-hour day. In other words a feed of 29.8 tons, together with the returns from this feed, make a total tonnage of 72 tons actually passing the roll.

This theoretical deduction I have found to very closely check the capacity of rolls for fine hard work, when all the shells are in perfect condition and all parts are running smoothly, and having careful attention. However, as before mentioned, it is im-

practicable to set a roll to  $\frac{1}{30}$  of an inch; in mill practice they are commonly set to a point of contact of the high points of the shell, and the average opening, when running full capacity may be taken at about  $\frac{1}{25}$  of an inch; at least this opening should be allowed in designing the elevator and screening surface. Under this condition there are proportionally more returns, and more ore is permitted to pass the rolls, although there is an increased crushing action of the particles among themselves.

At an  $\frac{1}{25}$ -inch opening the area of contact is  $12" \times \frac{1}{25}" = \frac{1}{2}$  square inch, and  $875' \times 12" = 3937$  cubic inches per minute or 236,250 cubic inches per hour, or 136 cubic feet per hour; this at 20 cubic feet of ore per ton = 6.8 tons per hour approximately, or 163 tons per 24 hours that may pass through the rolls. As we are trying to make this calculation approach the practical in order to compute the elevator, let us assume that we wish to crush 30 tons of crude stock in 24 hours under the above conditions, by allowing heavy returns—we have 163 tons that may pass the roll, this, minus 30 tons as feed, gives 133 tons that may be returned, or 82%. Accordingly, of the pulp passing the rolls, 58% may be considered as the minimum and 82% as the maximum returns to the roll. Should it be convenient to have the returns in percentage of the actual capacity, the above figures give 138% as minimum and 445% as the maximum returns that must be handled. These two above limits have been found to very closely check the practice of rolling, notwithstanding the claims of catalogues or makers. When the shells are new and true the first condition, with only small returns, is attained, but perpetual vigilance is not the attribute of the every-day mill man, and with a hard ore or pitting shell the latter condition soon prevails, and this condition should always govern the size of the elevator to accompany the rolls; it must be of capacity to meet the greatest load that may pass the rolls.

In operation daily tests are taken to see that the rolls are kept set between these limits. A saving of a single choke-down will easily pay for several months' expense of such a record. With this allowance a roll of 30 tons capacity must have elevator capacity for 163 tons; this is oftentimes the secret of roll work.

The ore in wet crushing represents about one-tenth of the pulp, or about nine parts of water must be added to serve as a carrier for the ore in elevators and launders, so that the total water and ore elevated per 24 hours, for a 30-ton roll, carrying 163 tons, would be 1630 tons:

163 tons ore at 20 cubic feet = ..... 2,260 cubic feet.  
1,467 tons of water at 32 cubic feet = ... 46,944 cubic feet.

This total elevator capacity may be called 50,000 cubic feet per 24 hours, or about 35 cubic feet per minute. Taking the average elevator belt speed of 300 feet per minute, and for heavy belt a space of 18 inches between buckets, 200 buckets will rise per minute, and must carry 35 cubic feet, or one bucket must carry .175 cubic feet, or 302 cubic inches; referring to the rated capacity of the elevator buckets of standard make it is found that a 12" x 7" x 6" has 300 cubic inches capacity, and is accordingly the least that can be safely used for the full capacity of the roll. The above figures are simple and cannot be refuted; their application may explain several failures. The use of a bucket smaller than 12 inches is a mistake I have made, and I one believe that is still quite common. Even with this size it is seen there is nothing to spare, though of course the re-

50 H. P. Turbine for McCloud River Electrical Co. of San Francisco, Cal.

(See front page.)

turns should always be kept below 82%. It is important to have the elevator set at an angle from the vertical, generally about 20°, and it will be noticed that most standard cups are constructed to have their full capacity at this angle. The capacity of the elevator is greatly aided by an idler supporting the loaded belt at about half of its lift; it prevents swaying and consequent splashing over of the buckets. Of course this makes heavy construction, but as a unit it is mainly desirable from the fact that the system takes less lost time in repairs and shut-downs, and as a whole little attention other than renewals, and these only when the parts are worn out in duty.

### Notes on Cyaniding in the Black Hills.

Written for the MINING AND SCIENTIFIC PRESS.

Less than two years ago cyaniding was of very little importance in the Black Hills. At the present time it is proving to be the salvation of many mining companies. About 75% of the ore in the Black Hills is adapted to cyaniding either direct or after amalgamation. These ores amenable to cyanide are of different characters, and among them are some of the best kinds of cyaniding propositions.

In the latter class the Ragged Top ores, opened up in the last few years, take the lead. In that district are immense ore bodies of a porous limestone formation, somewhat similar in character to the Mercur ores and carrying on the average \$6, \$8 and \$10 gold to the ton, which gives up readily to cyanide by coarse crushing.

The Spearfish M. Co. are operating a 200-ton mill, the largest in the Hills. They use Gates crushers, then rolls, so the ore passes a ½-inch screen, and, leaching at that mesh, they get from 80% to 85% extraction.

The ores of the Yellow Creek district are also well adapted to cyaniding after coarse crushing. The ore is quartzite, but the values are nearly all on the cleavage planes, so that crushing to a ½-inch mesh gives nearly as good an extraction as with the Ragged Top limy ores. The Wasp M. Co. have a very complete 50-ton mill, which has been running very successfully on the Yellow Creek ores since last fall. This ore carries so much silver that the bullion is over half silver. A new wet-crushing mill is contemplated on the adjoining property.

Then, in the Bald Mountain district, around Portland, is an entirely different class of ores, it being a very hard, close-grained, siliceous ore, classed as brown oxidized and blue unoxidized, the former being amenable to cyanide, while the latter carries better values and is smelted. This oxidized ore is of a different character than any of the others referred to, as it requires fine crushing for a good extraction. The old Deadwood cyanide plant, the first one in the Hills, operated several years on ore of a somewhat similar character. They crushed dry to 30 mesh, but recently closed down. Fine crushing on a hard ore with rolls is expensive, and on many ores is not as satisfactory or economical as wet crushing with stamps, using a weak cyanide solution instead of water. Bald Mountain ores are so hard and close-grained that fine crushing is necessary. The wet-crushing cyanide mill has been found most successful for these oxidized ores. With this method the ore is crushed with the weak cyanide solution right in the mortars. The sands and slimes are separated and the latter given a special treatment at little or no increased expense, and the total cost and time is less than for the dry-crushing mill, and gives as good or better extraction. The Portland M. Co. are operating such a wet-crushing cyanide plant on Bald Mountain ores near Deadwood. The Dakota M. Co. are also building a wet-crushing plant for a similar ore.

The Imperial M. Co. are planning to build a dry-crushing mill with rolls and a roasting plant so as to handle some of the unoxidized ores.

Besides the above different types of plants, there are several tailings plants. In this class is the immense plant for the Homestake mills. There the tailings from the plates run to jigs, which take out the heavy concentrates, while the tailings that pass from these jigs go through other large jigs, which take out most of the slime, and then the remaining sands are carried to the cyanide mill in a large iron pipe, where they are automatically distributed into the leaching tanks, the rest of the slimes overflowing to waste.

So, nearly all the different types of cyanide plants are represented here in the Hills. Most of the mills have little refineries for acid or roasting cleanup methods and turn out good bullion. Zinc shavings is the common precipitant, but the Homestake uses zinc, and charcoal is being given a trial for the weak solutions from the slimes treatment. While cyaniding was comparatively a new adventure for some of the mining men, and experience had to settle the best method in each mill, a good many original applications of old ideas have been brought out, and in a year or two more the Black Hills will be the greatest cyanide district known, embracing plants of every description.

S. A. E.

## Differences of Depth in the Original Positions of Epigenetic Deposits.\*

By Prof. J. H. L. Vogt, University of Kristiania, Norway.

The attention of both miners and geologists was long ago drawn to these theoretically interesting and economically important problems; yet only in recent years have they received thorough and comprehensive treatment.

These two phenomena—namely, the original differences of depth connected with the formation of ore deposits, and the secondary alterations of such deposits, occurring often, perhaps even millions of years later—are in many cases, as genetic factors, very widely separated; yet it may often be difficult to decide what is to be referred to the primary and what to the secondary process.

**ORIGINAL DIFFERENCES OF DEPTH.**—In considering the original differences of depth, it must be kept in mind that the present surface is, in general, very far below the surface existing at the time of the ore formation. The geological investigations of recent decades have shown that the work of denudation (or abrasion or erosion) must be measured on a larger scale than was formerly suspected. In the Archæan and Algonkian mountain chains (now often removed by this agency down to their base level), and also in the Paleozoic ranges (showing, as a rule, the effects of extremely energetic denudation, as, for example, the Ural and the Norwegian mountains), the difference between original and present levels is to be generally reckoned, not in such units as 0.1, 0.25, 0.33 or 0.5 kilom. [300 feet to 1650 feet], but rather on the scale of 2, 3, 4 or 5 kilom. [1 mile to 3 miles], or even more. Even in the Mesozoic and Tertiary, many denudations of astounding depth have been recognized.

As instances of great denudation the following may be named:

On the E. side of the Kristiania fiord, in Norway, this process has removed, (1) a series of Devonian conglomerates and porphyry overflows, with Silurian and Cambrian rocks, of an aggregate thickness of 2500 meters [8200 feet]; (2) also a large part of the Archæan surface—first, during the long period preceding the Cambrian, and again after the removal of the Cambrian, Silurian and Devonian strata. This thickness must also be measured in thousands of meters; so that we have here at least 4000, perhaps 5000, 6000 or even more meters of thickness removed.

In the Aspen silver district, Colo., 5 kilom [16,400 feet] of strata have been removed by erosion from a range of Tertiary origin.

In many epigenetic ore deposits of Archæan-Algonkian or Paleozoic origin (e. g., Kongsberg, Cornwall, Przibram, the Keweenaw peninsula at Lake Superior) mining has been carried to depths of 2500, 3300 to 4100, and 4100 to 5000 feet. Taking the depth roughly as 3300 feet, and assuming that in some districts the present surface has been denuded 10,000, and in others 13,000 feet below the surface at the time of the ore formation, we may say that mining has reached a depth of 10,000 to 13,000 or 13,000 to 16,000 feet below the original surface.

These figures are, of course, somewhat arbitrary; but modern investigations of the extent of denudation justify us in saying that they are not too high for some districts belonging to the ancient geological periods above named.

It may be observed, also, that in many deposits of deep and geologically old origin, the deepest portions of the mines have shown no change in the nature of the fissure formation. Occasionally, as at Przibram, Bohemia, and Dolcoath, Cornwall, the richest ore bodies have been encountered in the deepest mine workings.

We conclude, then, that, under favorable circumstances, the ore veins may continue at least to a depth, below the original surface, of 10,000, 13,000, 16,000 or more feet.

It may also be remarked, in passing, that mineral deposits may be made from solutions at above the critical temperature (364° C.) of water—for instance, the deposits of cassiterite, wolframite, apatite, topaz, tourmaline, and even pyrites, in many granite-pegmatite veins.

In his latest treatise, which is rich in new conceptions, De Launay compares ore deposits occurring relatively near the surface, in less denuded regions, with those deep below the surface in strongly denuded regions. As instances of the former, he takes the quicksilver deposits, which occur chiefly in recent rocks, near volcanic eruptives, while from older ranges, partly destroyed by erosion, they have disappeared, with other debris. As instances of the latter class, he takes the pyritic deposits (Roros, Huelva, Schmollnitz, etc.), which have been found in old mountain chains or in districts of regional metamorphism, and are to be explained as of deep-seated origin. He also mentions very briefly the lead-silver veins.

Induced by this description I have suggested the hypothesis that the differences between the later gold-silver-lead veins (Nagyag, Comstock, Potosi, etc.) and the old gold and silver-lead veins (Kongsberg,

Erzgebirge, Harz, Przibram, etc.) may be explained by their formation at different depths. The relative or total absence from the older veins of the propylitization which is so characteristic of the later ones may, perhaps, be due to the fact that hydrogen sulphide (or sodium sulphide), which was a very important factor in this process, could not, under the great pressure due to great depth, make its way from the solutions in the fissures into the country rock.

The later silver-lead veins are, on the whole, richer in silver than the older ones. This may be connected with the fact, inferred on physico-chemical grounds by Van Hise, that at a great depth lead sulphide separates in larger proportion than silver-sulphide or sulpho-salts. According to this view, the precious silver veins (carrying relatively little galena and zinc blende) of recent eruptive ranges become, at a very great depth, richer in galena and zincblende. This seems to be sometimes the case. (Instances are given further on.)

This hypothetical view is not contradicted by the fact that many of the older silver-lead veins, as at Andreasberg and Kongsberg, are highly "precious"—i. e., relatively poor in galena and zincblende; for this character may be due to the small proportion of lead and zinc in the original vein solutions.

In view of the range below the original surface through which mining is carried on, beginning, not at that surface, but already thousands of metres below it, we may easily see that, in many districts, the directly observable differences in original depth have little significance. For instance, at Kongsberg there is no difference in the character of the veins from the present surface to 0.5—0.75 kilom. below it.

In other districts, however, very important differences of original depth have been established. For instance, these differences were very distinct in many Cornish mines, where the veins carried: (1) at the uppermost level (in the tin-bearing gossan) tin stone and a little copper ore (the latter as the result of a secondary process, the original sulphides having been mostly leached out of the gossan); (2) their copper ore, with some tin stone (in the Dolcoath mine, to the depth of 0.3 to 0.33 kilom. below the present surface); (3) still deeper, first, a zone of mixed tin stone and copper ore, and under that almost exclusively tin stone. The veins traverse, in depth, chiefly granite; at higher levels, slates. But zones 2 and 3 are not confined to either rock. In this case, then, the tin stone was originally deposited at a greater depth than the copper ore.

In many silver-lead-zinc veins there is an increase in the proportion of zinc-blende with depth. The Clausthal veins, and many in Mexico (Pachuca, Zacatecas, etc.) are instances. In the latter, very important differences in the depths of original deposition are often observed. (1) Near the surface are very rich silver ores (the so-called colorados, containing cerussite with chloride, bromide and iodide of silver, and native silver), the richness of which is the result of secondary processes. (2) Below these, after an intermediate zone of transition, appear for the first time the so-called negroes ores—galena, silver-glance, silver sulpho-salts, etc.; and (3) in the deep workings, say 0.5 kilom. below the present surface, the so-called fuego ores, carrying much zinc-blende and galena, with a scanty admixture of true silver ores. It is possible that the Tertiary Mexican veins have in depth a character resembling that of the older rather than that of the younger group described in a previous part of this paper.

With regard to the increase of zincblende in depth, which has been observed in many places, I have already observed that Van Hise, in his last paper, concludes upon theoretical grounds that from an ascending solution containing zinc and lead, the zinc sulphide would be deposited lower down than the lead sulphide. In many veins carrying copper and iron sulphides, the richest copper ores are found at the higher levels. As Emmons and Weed have shown for the Butte district, this is in numerous cases the result of a secondary process. In sundry localities, however, the influence of original differences of depth may be recognized. This is the case, for instance, at Vignas in Norway, where the ore, a fine-grained mixture of chalcopryite with pyrite, occurs in several (about seven) nearly vertical "stocks." In the upper levels the pyritic mixture carried easily 3% to 4% of copper; at the depth of 735 meters the thickness of the mass was, on the whole, tolerably well maintained; but the copper content had sunk to about 1%, or a trifle more.

A corresponding phenomenon is not presented, however, by the flat-lying pyritic masses or "lineals" at Roros, which dip respectively 9°, 9° and 15°, and have been worked in these dips to distances of 1080, 1350 and about 2000 meters.

In the pyritic deposit at Huelva (at Rio Tinto, Tharsis, etc.) the secondary concentration in the "zone of enrichment," immediately below the "iron hat," plays a very important part; but there appears to be, besides, a primary distribution according to which the copper diminishes as depth increases.

According to many American reports, there are also in the United States and Chile many known instances of the deposition, from an ascending ore solution of pyrite and chalcopryite, in which the former was, to a considerable extent, deposited deeper than the latter.

\*Trans. Am. Ins. Mining Engineers, Feb., 1901.

## Rare Minerals in Gold-Quartz Veins of Eastern Oregon.

Written for the MINING AND SCIENTIFIC PRESS  
by WALDEMAR LINDGREN.

**ROSCEOLITE.**—This rare mineral is of considerable interest, as it generally has been found closely associated with native gold in gold quartz veins. First discovered in several small quartz veins near Coloma, El Dorado county, Cal., it has again been found in Boulder district, Colo., and lately, also, in Kalgoorlie, Western Australia.\* The mineral belongs to the group of the potassium-mica, in which the aluminum is partly replaced by vanadium. The analyses disagree somewhat, and a definite formula is not, as yet, established. The original analysis by Genth gave:

|                                      |       |
|--------------------------------------|-------|
| SiO <sub>2</sub> .....               | 47.69 |
| V <sub>2</sub> O <sub>5</sub> .....  | 20.56 |
| Al <sub>2</sub> O <sub>3</sub> ..... | 14.10 |
| FeO.....                             | 1.67  |
| NaO.....                             | 2.00  |
| K <sub>2</sub> O.....                | 7.59  |
| Na <sub>2</sub> O.....               | .19   |
| H <sub>2</sub> O.....                | 4.96  |

Total.....98.76

During a recent examination of eastern Oregon, I found this interesting mineral at several mines, always associated with rich ore and ordinarily much free gold. It occurs abundantly in the recently discovered rich shoot of the Belle of Baker; in the rich shipping ore found some time ago in the Golconda mine, and, finally, in a similar rich shipping ore lately discovered in the Columbia mine. The mineral, which is very conspicuous and looks much like finely divided chlorite, has a dull greenish color with a slight tinge of yellow. It occurs intimately intergrown with quartz in micro-crystalline aggregates of tufted fibers, generally so fine that its separation from the quartz is almost impossible. The mineral has high double refraction, but the fibers do not seem to be strongly pleochroic. The gold is frequently intergrown with it or surrounded by it.

**CHROMIUM-MICA.**—The argillites and quartz in many of the mines of the Greenhorn mountains contain greenish spots, which have often been mistaken for copper, but which in reality consist of finely divided chromium-mica (fuchsine or mariposite). The same mineral also occurs at the Golconda mine, and the stain is somewhat similar to that of roscoelite, but of a slightly more bluish tinge.

**CALCIOVOLBORTHITE.**—A mineral allied to this species was found in the Little Baby copper prospect, near Gilkeson's ranch, about 25 miles northeast of Baker City. It occurs as bright citron yellow scales and aggregates with pearly luster on the black, soft argillite in which the copper prospect occurs. Only a small quantity could be obtained for examination. It is essentially, according to Dr. W. F. Hillebrand, a vanadate of copper, but contains, besides, some sodium, and while corresponding approximately as to its percentage of copper and vanadium with the mineral mentioned, it is probably, in fact, a new species.

**SHEELITE.**—This tungstate of lime occurs at the Flagstaff and Cliff mines near Baker City, as first shown by Mr. C. King of that place. The mineral forms white masses, intergrown with quartz, and is not crystallized. Scheelite is not uncommonly found in gold quartz veins. It has been noted in such veins at Grass Valley, Cal., Warren, Idaho, and also in New Zealand.

**CINNABAR.**—In the Columbia, the Ibex and other gold-quartz veins near Sumpter, small quantities of cinnabar have been found. The placer mines of Susanville also contain cinnabar in pebbles intergrown with quartz.

**MERCURIAL TETRAHEDRITE.**—A tetrahedrite, containing mercury, was identified by Dr. Hillebrand in specimens of rich ore from the Columbia mine at Sumpter. The ore contained, besides, roscoelite and native gold.

\* T. A. Rickard, Eng. and Min. Journal, Nov. 17, 1900.

An official statement received at Dawson from Ottawa shows that up to the first of this year the total royalty collected from the Klondike mines by the Canadian Government amounts to \$2,040,192.61. The statement also contains the information that the total revenues received by the Canadian Government from Yukon Territory since 1896 amounts to \$4,376,673.17. This includes receipts from royalties, customs, public works, fisheries, fees in various departments, land sales, rentals, timber dues, placer grants, sales of miners' certificates and the like. The excess of receipts over expenditures of construction in the fund for the entire period since 1896 until the first of this year is \$693,820.

A new artificial stone is made by heating seven parts of sand with one part of Portland cement. The dry mixture is run into steel molds. The latter are then run into a boiler and boiling water turned in under pressure sufficient to force it through the sand in the molds. The cement slacks, but is not allowed to expand, the setting and drying taking place under the resulting enormous pressure. The finished structure is a very hard stone, costing in desired shapes less than natural stone.

## Salt Lake County, Utah.

[STAFF CORRESPONDENCE.]

The Columbia group has been working of late by leasers, who mill their product at the Rogers mill. Most of the ore averages about 5½% copper. A recent 200-ton lot ran 6½% copper, with small values in gold. The question of erecting a mill for the Columbia is being considered.

The Shawmunt, in charge of R. G. Legg, has completed a mill which may start up soon. The mine is opened through a 200-foot incline, with drifts therefrom at the 100 and 200 stations. The U. & I. vein, which belongs to the Shawmunt, has been opened through a shaft and tunnel.

The Last Chance, located at the head of one branch of Carr fork, belongs to C. J. Hodge and associates. It has an old concentrating mill which is being repaired and put in condition to operate on silver-lead-iron ores from the upper workings. The lower tunnel goes in 3000 feet and is being pushed on through the lime foot wall, through the fissure to the quartzite hanging wall. A shaft from the surface connects with this tunnel; the latter gives 1500 feet of stoping ground above it. The surface holdings here are extensive. The deeper workings are expected to get into the copper belt, similar to the one in which the Highland Boy is mining.

The Highland Boy is operating a new Rand compressor, which is a cross-compound with intercooler between the high and low pressure cylinders. The low pressure air cylinders are 18x36, the high pressure being 10x36, the low pressure steam cylinder being 22x36 and the high pressure 12x36.

The Yampa mine, situated east of the Highland Boy, belongs to the Tintic M. & D. Co., whose development is in charge of W. J. Craig. Their holdings cover about 3000 feet along the apex of the vein. The ores comprise an iron and copper sulphide, with values in copper and gold. The plan is to drive 3000 feet along the strike of the vein, to connect with a 1600-foot shaft from the surface at a higher point. The tunnel is now in 200 feet and the contemplated deep shaft has been commenced.

The Ben Butler is west of the Red Wing. It is being opened through a tunnel that enters at the bottom of the gulch, going in most of the way on the vein. From a station near the breast of the tunnel a slope 70 feet high has been carried for some distance. At another point a raise has been made on a shoot of ore and stoping is being done on both sides of the raise. Work has commenced to connect with the old workings farther east and above. It is claimed the ore here runs as high as 25% copper, 36 ozs. silver, 12% to 15% iron, 5% lead and \$5 gold. A recent 75-ton shipment to the smelter was made. They have a considerable amount of mill ore. In the older workings above the ores were considerably oxidized. A. L. Jacobs is manager and J. E. Tadlock superintendent.

The leases on the Red Wing are all expiring and it is likely the company will operate its own mine from now on. Four cars of ore were recently shipped to the smelter from this property.

The Winnamuck mine and mill are under bond and lease to the Tiawauke M. Co., the latter owning grounds above and adjoining the former. The old Winnamuck mill has been equipped with new concentrating machinery and will soon be operating on material from the old Tiawauke dump, a horse tram-line having been built to connect the two.

Bingham Canyon, May 18, 1901.

WASCOTT.

## Patent Office Exhibit at Buffalo.

The Patent Office exhibit in the Government building of the Pan-American Exposition presents some of the newest models of inventions in lines of economic development. It aims to show the influence of the patent system in our civilization, and to give some indication of the probable increase in comforts and luxuries that will be accessible to the masses of people in the next quarter of a century.

It shows how the progress in invention in one age makes it possible for the poorer classes to enjoy in a later age what was not even accessible to the rich a score of years before. Twenty-five or thirty striking inventions of domestic utility or economic significance graphically illustrate the possibilities in this respect.

A number of specimens of cotton are shown which by a chemical process are so treated as to render them indistinguishable from silk. A large number of models in a great glass case illustrate the development of the harvesting machine. The Ives Kromskopi, an instrument that makes it possible to view a photograph in colors, is an interesting exhibit. A model that is of no practical importance, but of considerable popular interest, is one made by Abraham Lincoln.

On the islands of southeastern Alaska they have a type of prospectors known locally as "beach combers." There are no roads and very few trails in the country, and boats are an indispensable portion of a prospector's outfit. When the first rush swarmed past these islands to the Klondike the scattered white population of the islands, salmon and halibut fishers for a few months each year, turned to prospecting between seasons. Ore vein exposures of gold and

copper are numerous on the rocky beaches and the early prospectors located these beach exposures, claiming everything that showed even pyrite. They never explored or located claims away from the beaches, hence the name.

## Cost of Diamond Drilling.\*

By J. J. JORDAN, M. I. M. M.

The subjoined figures refer to a series of six 1½-inch prospecting bore holes sunk in the Sombrette Co.'s San Pedro mine, Fresnillo, Zacatecas, Mexico, in 1898. The motive power was compressed air, and the water needed for washing out the hole and cooling the carbons was pumped from an adjacent mine drain. The bores were made from the 827-foot level, and involved cutting two rises of 30 feet clear to accommodate rods when lifted. The rock was hard grayish-blue slate, with seams of quartz and heavy spar carrying some argentiferous pyrites. At each set-up of the drill three holes were bored.

## DETAILS OF HOLES.

|                                                   | A.        | B.  | C.  | D.  | E.  | F.  |

## The Training of Workmen.

Nearly all trades and handicrafts have been invaded by machinery, some in a vastly greater degree than others. Work which was deemed beyond the capacity of machines but a few years since is now regularly done by them, and the best craftsmen to-day in many industries are those who execute repairs. These facts are enough to discount the value of a long apprenticeship now. But more remains to be said.

Apprenticeship under the old guilds was an intensely personal relation. But the relations between employers and factory hands to-day are impersonal. An apprentice now is only so in name, a numbered unit who puts in his cheque with other numbers. He is not taught a trade. He must pick it up for himself. It is nobody's business to instruct him, neither his master's, nor his foreman's, nor the workmen's. In some of the smaller shops in country towns traces of the old relations still remain, but they are becoming more and more exceptional.

It is generally to the interest of an employer that an apprentice should not learn his trade as a whole, but only a little section of it. It pays better to keep a lad repeating the performance of one section of his craft than to teach him all. More money is made. But the apprentice becomes a young specialist over some little piece of handicraft, at which he may earn something over his normal wages. And many a lad does not become disillusioned until he has to face the world and try his luck in other shops. And, therefore, the best shops in which to place a lad are not the big establishments, but the small ones, where every class of work is done, and the tools and appliances are often scant. A lad will learn more in these than in those replete with every appliance, and minutely subdivided into sections and groups.

The best training for a lad to-day is that which he can evolve for himself. The greatest evil that can befall him is to become a specialist, and nothing more, while in his teens. Yet that is what must happen if he spends several years tending machines, or doing repetitive, unvarying tasks in one big establishment.

The best training, therefore, to-day is that gathered by the peripatetic youth. If a lad cannot gain experience in one place he should move about, gathering as much as he can accumulate with one firm, then on to another, and attending training schools as opportunity offers. His views become broadened, he becomes self-reliant, and, in time, having found his true work, he may settle down as a specialist.—Joseph Horner, in Cassier's Magazine for June.

## Mining and Metallurgical Patents.

Patents Issued May 21, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

AMALGAMATOR.—No. 674,624; J. Y. Byers, Descanso, Cal.

The muller comprising a pair of annular plates having inner sides beveled and converging outwardly, shoe rings having circular rabbets on inner sides, in which rabbets annular plates are disposed and cross-blocks disposed between annular plates and spacing them apart, cross-blocks, annular plates and shoe rings being secured together, in combination with a revoluble cylinder having annular dies on which shoe-rings operate, a runaway being formed between annular dies.

TUNNELING APPARATUS.—No. 674,415; D. L. Hough, New York, N. Y.

A hood or shield, a bulkhead in hood or shield comprising an outer rotatable part or tool carrier and an inner stationary part, means to rotate outer part and means to supply water under pressure to space between outer and inner parts.

METHOD OF TREATING ORES.—No. 674,639; M. Seligsohn, Denver, Colo.

Process of treating ores which consist in discharge into wet pulp, of air charged or impregnated with ammoniated air and bromine gas which will not only alter physical condition of particles being treated, but also is efficacious in saponifying any grease or oil that may be present in pulp, clarifying and making pulp more amenable to amalgamation by its action upon clay and matter in suspension and keeping amalgam upon plate clean and of proper consistency to accomplish its functions, and passing so-charged pulp over an amalgamating plate.

GOLD SEPARATING MACHINE.—No. 674,533; J. Broyles, New Whatcom, Wash.

A frame having an elongated reservoir at one end, a second reservoir at opposite end, and a series of reservoirs approximately midway of its length, double plate secured to frame between reservoirs, a hollow metal cylinder over elongated reservoir, a concaved scraper secured to sides of frame and having

one edge bearing against cylinder, means for magnetizing surface of cylinder, cylinders having perforated plate on surfaces over series of reservoirs, a larger cylinder having a perforated plate on its surface in the remaining reservoir below plane of other cylinders, a shaker box in reservoir, a plate secured at one end of frame passing under cylinder and having a flared end entering shaker box, a trip wheel on the spindle of large cylinder, a lever pivoted to side of frame and having its free end engaging trip wheel, a second lever fulcrumed at one end to first-named lever and secured at other end pivotally to shaker box, means for adjusting cylinders and means for operating cylinders simultaneously.

PROCESS OF TREATING ORE.—No. 674,594; C. J. Best, Denver, Colo.

The process of treating ores, which consists in preparing a compound, consisting of one part of common salt, one-sixteenth part of permanganate of potassium, six parts common niter and from ninety-two to ninety-six parts water, all dissolved, then crushing ore to a fineness of preferably twenty mesh, then sprinkling ore with compound and letting it lie for approximately twelve hours, then roasting same in a muffle furnace, with 1200° to 1500° of heat.

ROTARY BLOWER.—No. 674,536; T. W. Green, Philadelphia, Pa.

The pillow block B' having thereon journal boxes b b, gear housing C integral with pillow blocks and supported thereon, gear wheels C C, and end plate A', having grooves d d, and channels d' d', gear wheels C C being covered by gear housing and secured upon driving shafts B B, between journal boxes b b, and end of plate A'.

PROCESS OF TREATING ZINC-BEARING ORES FOR OBTAINING ZINC, ETC.—No. 674,809; S. O. Cowper-Coles, London, England.

Process for the treatment of complex zinc ores, such as those known as "Broken Hill" ore, consisting in first roasting, crushing and screening ore, then placing it in vats and washing ore with water afterwards run into an evaporating pan, then leaching ore with a weak solution of sulphuric acid to sub-

tract zinc and copper, then passing such solution containing zinc sulphate and copper sulphate through a body of carbon and an electropositive metal to recover copper, then electrolyzing remaining solution to recover zinc, again washing ore with water afterwards also run into evaporating pan, then treating ore with a solution of caustic soda to extract lead in the form of sodium plumbate, then electrolyzing solution to recover metallic lead, and then leaching remaining ore in vats with potassium cyanide and subsequently electrolyzing such solution to recover the metallic silver and gold.

ROLLER MILL FOR GRINDING AND CRUSHING.—No. 674,718; J. C. Wegeriff, Leigh-on-Sea, England.

Rolls partially superposed and having their axes lying obliquely across each other, in parallel horizontal planes and in different vertical planes, the rolls being of truncated concavo-conoidal or semi-hyperboloidal form, and both rolls being coned toward same side of the machine.

APPARATUS FOR SEPARATING METALS FROM THEIR ORES.—No. 674,563; W. A. R. Loose, Provo, Utah.

A furnace, a plurality of inclined muffles within furnace, means for feeding ore to muffles, closures for lower ends of muffles and adjustable with relation thereto to regulate discharge from muffles, a receptacle adapted to contain water into which ore is received from muffles, and an agitator within receptacle.

## Alaska Copper Fields.

Near the head of the Klehini river, just off the Dalton trail, in British Columbia, lies the Rainy Hollow copper region, which was discovered late in 1898. Copper is found in bornite, chalcopryite and malachite, occurring in veins from 18 inches to 2 feet in thickness. The assays of copper ores from this region run from 20% to 55%. There are indications that the deposits cover a great area. It is easily accessible to tide water and only 50 miles from a good harbor.

Kletsan creek runs through a region known for years among the Indians to be copper-bearing. Up to 1891 the region, however, was not investigated by white men. Copper is here found largely in the greenstones. The placer copper deposits are contained in stream benches through which the streams have now cut their courses. The placer copper is irregularly distributed on the bedrock and among the boulders. The Indians have worked the region but slightly.

A third belt of copper deposits was found between the Tanana and Nebesna. Copper pyrite was found in the greenstones, but not veins of native copper, as at Kletsan creek. Here also are indications of an extensive deposit, of which little is now known.

The two copper belts are each about 40 miles long, with possibilities of their extending in both an easterly and westerly direction. Future investigation will be required to determine the size and depth of the veins. If a railway were ever built into this region it will naturally be constructed from Valdez, which is 200 miles away. Such a railway might also give access to the reported copper deposits on the Chitna river.—Alfred H. Brooks in Report of the U. S. Geological Survey.

REPRESENTATIVES of the United States and Mexican boundary commission are making a voyage down the Rio Grande in three boats to take observations and make a more complete survey of the river. P. D. Cunningham, chief engineer of the United States commission, is at the head of the expedition. The party proposes to follow the course of the river from El Paso to the Gulf of Mexico, a distance of nearly 1300 miles. It will require three months to make the trip and for a distance of 600 miles all communication with the outside world will be cut off.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

Rich copper deposits on Prince of Wales Island are reported by S. I. Silverman of Spokane, lately returned from southeastern Alaska, after an investigation there in the interests of some Spokane, Wash., people who form the Alaska Development Syndicate. He says: "It is a country of surprises. I expected to see some good properties, but I was not prepared for the immense leads which exist on the islands. I was in Rossland during the early stages of its history, and it is no disparagement to the Kootenay camp to say that the showing on Prince of Wales Island is far ahead of the early indications at Rossland. Much of the ore has a pure iron base, without a trace of silica, and of course it is an ideal smelting proposition. Values range about 5% copper, which is equal to \$16. One ledge I saw, the Iron Crown, is from 200 to 300 feet wide, has been traced for a mile. The Hetta Mountain group carries ore showing almost solid chalcopryites. The lode is a contact between lime and granite. Seven open cuts show that it extends for 3000 feet. Several assays give an average of 10% copper, with three ounces of silver and \$2 in gold. The group is a grass root shipper. The vein is all the way from 2 to 20 feet wide. These properties lie on the west of Prince of Wales Island, in latitude 59 and are within 1 or 2 miles of tidewater. There is a fine harbor. The transportation question solves itself. As for the climate, it is much the same as it is along Puget Sound. Back in the hills there is snow, but along the coast the snow has long ago departed. The country is still in its virgin state. The Hetta group was located about two years ago. The Iron Crown was staked last January. It looks to me like a country with a great future."

At Juneau, Captain Ray, manager of the Cook Inlet Coal Fields Co., announces that that company can now supply all Alaska with coal. A 15-mile railroad from the beach has been built to the mine. Arrangements have been made for shipments to Juneau and Skaguay, and later the company will put on its own line of steamers.

J. Cronin of Fargo, North Dakota, one of the principal owners of the marble quarries near Shakan, on the north end of Prince of Wales Island, is taking fourteen experienced quarrymen to begin work on a more extensive scale. The marble is pure white and is said to be a fine grade for interior finishing and for tombstones.

About 230 miles inland from Valdez is the Chesna mining district. Here the Chesna M. & I. Co. is operating a placer mine, employing a large number of men. It has a sawmill and other necessary outfit for working the property. The discovery was made and the ground tested in 1899. It took all of that year to get the plant in and the ditches built before the freeze-up. The ground runs from 50 cents to \$15 per cubic yard. The company has 660 acres. It has also discovered coal of a good quality for blacksmithing and heating purposes. It expects to use two nozzles on the ground this year and to handle 1000 yards of gravel per day. At present it costs about 50 cents per pound to freight into the Chesna district.

Slate Creek, Chesna district, is said to be very rich and considerable sluicing is being done there. About \$15,000 was brought out from Slate Creek last year. The gold is high grade, averaging \$18.70 to the ounce.

### ARIZONA.

#### GRAHAM COUNTY.

South of the Marquita in the Cholas range of mountains, a large number of men are placer mining with dry washers. It takes four men to operate the large machines—one at the fan or bellows, two shoveling, while the fourth man removes tailings and looks after the riffle-board. After five or ten minutes' work the concentrates are removed and dumped into a pan, which is manipulated as if using water, the dirt and gravel being quickly thrown aside. Sometimes but a few colors are obtained; again, dust to the value of 50 cents or \$1 is panned out, and exceptionally, nuggets weighing from \$5 to \$10 are found. The dry washers in this county are making from \$50 to \$100 each per month, and their gold dust is the money of the district.

#### PINAL COUNTY.

The Cochise M. & M. Co. has bonded the Chamberlain group, making a payment down. The company proposes to start work at once and to make a trial shipment. The ore in some cases runs as high as 42% copper, the average being claimed to be upwards of 10%.

### SANTA CRUZ COUNTY.

A. C. Coffey and associates of Patagonia are now working eleven men on a strong well-defined ledge carrying lead-silver ores and some copper.

The Happy Jack M. Co. of Patagonia have developed a fine body of ore in a shaft sunk to a depth of 140 feet. They are now running a tunnel in the ledge to intersect the shaft, at a distance of 300 feet.

### CALIFORNIA.

#### AMADOR COUNTY.

A company bonding the Evans & Fitzgerald gravel claim at upper Rancheria are preparing to work the mine on an extensive scale. A mill is to be erected for crushing the gravel, some of the machinery being on the way to the mine.

The Moon M. Co.'s copper property is situated on Jackson creek, in this county, about 7 miles from Ione. The working shaft is now down 50 feet, showing a 20-foot ledge of excellent ore. N. W. Mahaffey is manager.

Work is progressing on the Amador Queen No. 2 on a ledge just west of the Amador Queen No. 1; J. R. Phillips of Jackson is Supt.

The stockholders of Del Monte M. & M. Co. held a special meeting in Jackson May 15 and ratified the recent reorganization of the company. Work will be started on the new crosscut tunnel from the Calaveras river side, to cut four of the ledges on Del Monte ground at a depth of from 400 to 500 feet. At the same time the upper drift on Del Monte ledge will be worked to supply the mill.

#### CALAVERAS COUNTY.

The Lightner M. Co. has just paid a dividend amounting to \$10,225.50. The company is now working 107 men. The mill of forty stamps is operated by electricity. The old original payroll of 1856, when the mine was operated by H. Adams, Sr., and J. Easton, is in the possession of H. Adams, Jr. At that time an arrastra was used to crush the ore.

#### INYO COUNTY.

The Burns & Anderson mine at Independence has been bought by H. C. Steele for about \$10,000. Development work is now being done and mill is to be started soon.

#### MONO COUNTY.

The South End Tailings Co. of Bodie propose building a 10-stamp mill near the South End cyanide plant to do custom crushing.

#### NEVADA COUNTY.

The Yellow Diamond mine, near Grass Valley, owned by A. J. Ragion, has been bonded to outside parties represented by H. F. Morse of Amador county, who is opening it up. There is a tunnel on the property and a shaft, and by the first of June men will be at work cleaning them out. The company will put a new hoisting rig on the ground immediately.

#### PLACER COUNTY.

Development will soon commence on the Big John Hill mine, near Colfax. Water will be taken from the South-Yuba canal. The mine is owned by E. Bigley and Mrs. Hinchey of Weimar.

The new owners of the Bob Lewis No. 2 gravel mine, near Forks House, are building a road from the Red Point grade to where their tunnel to mine the channel will be started.

#### SAN DIEGO COUNTY.

A company is said to be preparing to work on the Gold Crown group of claims at Picacho, owned by Capt. I. Polhamus of Yuma, J. Mendibles of Picacho and a number of Los Angeles parties. A \$60,000 smelter is contemplated.

#### SANTA CLARA COUNTY.

Rich deposits of cinnabar ore have been discovered on Silver creek and are being developed by the Bradford Q. M. Co. A town is building at the site of the mine, and the postoffice department has promised to establish a postoffice. The county supervisors will provide at their next meeting to open a county road to the mine. The work of constructing the new roasting furnace will be completed in three weeks.

#### SISKIYOU COUNTY.

W. G. Tyrer, manager of the Cherry Hill quartz mine, Sawyer's Bar, is working fifteen men, taking out quartz and running the mill.

The Downing Con. G. M. Co. is operating near the Klamath river on Ash creek. From the tunnel in the mine \$12,000 has been taken out of a pocket in 12 feet of ground. J. W. Downing is Supt.

Fernandez & Co.'s hydraulic claim, Cherry Creek, Sawyer's Bar, employs twelve or thirteen men, and it is believed will clean up about the last of June \$10,000 more than the usual season's average.

E. Wallace has sold the Black Bear quartz mine at Black Bear to a Boston company for \$160,000, John Daggett, the

former owner, retaining a small interest. The ledge in the new shaft is from 2 to 20 feet in width and pays about \$17 or \$18 a ton. The new company intends putting on more men and will work the mine more extensively than ever.

#### TRINITY COUNTY.

A party of surveyors, consisting of H. L. Swain, H. D. Janett, R. B. Markle and F. Swain, are now surveying the ditch to bring water to the Sweepstake mines near Weaverville. They will be engaged in the work several months.

#### TUOLUMNE COUNTY.

H. Favot, L. Lebrun and C. A. J. Waterman have bonded to R. S. Enslow and A. M. Williams of Los Angeles, the Feliciano, Gringo, Long Hidden Treasure and Overlooked quartz mines, situated near Jacksonville, at \$26,500.

Grading for the hoisting work and shaft at the Mack Con. G. M. Co., at Big Oak Flat, is completed and sinking commenced. The retaining walls of the new 20-stamp mill are completed and the mill timbers and iron work are being put in place. The concentrator building is all up. C. L. Lang is the Supt.

The Hornlein brothers of San Francisco and J. A. Mand of Milwaukee, Wis., operating over the Norwegian mine, near Tutletown, are said to be considering the construction of a 10-stamp mill at an early date.

#### YUBA COUNTY.

Thirty years ago under a copper mining excitement hundreds of claims were located and twenty-six were being worked at one time in Yuba county. Fully \$100,000 were expended by the locators in one year. In some instances large lodes were developed and ore was shipped for smelting tests. In the Yuba claim a shaft was sunk to a depth of 180 feet on a well defined lode of copper, and many tons were raised to the surface. This ore when hauled by teams 16 miles and then shipped to smelting works would not pay. But there are thousands of tons of copper ore in that claim and it can be mined at a low figure. A smelter located at the mine, similar to the works at Keswick, would produce profit.

### COLORADO.

#### BOULDER COUNTY.

The Golden Eagle group of claims, consisting of the Golden Eagle, Golden Eagle No. 2, Golden Eagle Extension and Dorchester, is to have a new and complete outfit of machinery, sufficiently powerful to go down 1000 feet. The company owning the group is composed of Iowa men. J. T. Fitzgerald of Boulder is manager and J. P. Clark superintendent. The company has a tunnel in 1100 feet, and is both sinking and preparing to make an upraise.

The Caroline mine has been opened at Wall Street; G. Calberg, late of Cripple Creek, manager. The ore at the surface of the shaft runs \$25. There is a 22 H. P. gasoline engine, a Freeman hoist and patent dumper on the mine. The shaft is going down 200 feet.

#### GUNNISON COUNTY.

The Grafflin M. Co. has commenced work on the Iron Cap mine at Spencer. The company expects to handle the low-grade ore in the mine.

#### HINSDALE COUNTY.

G. H. Martin, president of the Chicago Co., operating the Moro and Ajax claims, has been inspecting the property and preparing for the erection of a new mill. The mines show an immense body of ore, most of which will have to be concentrated. E. E. Chase, mining engineer of Denver, is making an examination of the mine and a test of the ore, for the purpose of deciding upon the kind of mill needed.

#### LAKE COUNTY.

Ex-Governor Anson Walcott of Indiana, principal owner in the Walcott M. Co., whose property is operated under lease by the Coronado M. Co., says the property is in splendid shape, and that preparations would be made for shipment of 100 tons daily. The Walcott Proprietary Co. owns twenty-one acres, extending from the Lucy B. Hussey to the South Park tract, with fine ore channels under the streets and alleys of the city of Leadville. Governor Walcott declares that he will carry up the case and fight it out in the Supreme Court of the United States.

The territory at Leadville which will be affected by the Supreme Court decision extends from the Elk and Lucy B. Hussey mines on the east, and near the West Carbonate fault, to the downtown and Capitol Hill properties on the west, a distance of about 1 mile. The streets and alleys included in this territory contain a total of about 200 acres. The following companies operating and shipping ore will hereafter pay royalties to the city of Leadville: The New Leadville Home M. Co., Home Extension, Bohn, Northern, Coronado, Fifth Street, Midas, Caribou,

Orion, Welden, Cloud City, Maple Street, Downtown, Morocco. This territory has recently been developed and bodies of iron ore have been opened which will net from \$5 to \$10 per ton. There is also a considerable amount of steel iron, which is worth \$4 per ton on the cars.

The Midas mines, with fifty-eight men, are producing 200 tons of iron oxide ores, carrying from ten to fifteen ounces silver, with 52% iron excess. An unexpected find is now being developed. In the O. Z. claim a new ore channel recently uncovered is making a large production, averaging twelve ounces silver and 50% iron. One stope is 50 feet wide, 40 feet high and 100 feet long, with no foot wall disclosed.

#### MONTROSE COUNTY.

E. C. Hamilton and L. W. Galloway, owners of the Copper Queen group, near Paradox, are erecting a mill. The process to be employed is lixiviation, the principal ore value being uranium. The Sunrise group, in Paradox valley, owned by these same parties, has been leased to Ouray parties, who have already begun active operations.

#### PARK COUNTY.

The Fanny Barret mine of Alma district has again resumed operations under the Fanny Barret Mines Co. of Denver, who have bonded it. It is an old producer credited with a production of nearly \$1,000,000, all taken out in a comparatively brief period. The mine was worked up to 1893, but since then has been closed. A. M. Rucker has been appointed manager, and work has commenced in clearing out the old workings and getting the property in shape for production.

#### PITKIN COUNTY.

The first shipment of ore from Red Mountain district has been made from the Nellie Mack mine. The existence of ore in the Red Mountain district, disputed by experts, has been proven by J. McVeigh, who, persisting in development, has opened a big body of ore in the contact formation. He has fourteen men sinking and taking out ore.

#### SAN MIGUEL COUNTY.

The Ophir Con. Co. has begun the construction of its new mill and tramway at Ophir Loop, Telluride. The mill, of 100 tons daily capacity, will be equipped with crushers, rolls, 1050-pound stamps and Wilfley tables for the primary treatment of the ore. The secondary and final treatment will be by Huntington mills and Frue vanners. The character of the output points to this method as the most effective and profitable. A large amount of second class ore, running from \$15 to \$20 per ton, has accumulated on the Silver Bell and Butler dumps during the past ten years, which will be milled as rapidly as possible.

#### SUMMIT COUNTY.

It is said that M. M. Howe has successfully negotiated the sale of the Galena Gulch mill to Chicago people. Two claims and the mill are included and the price is reported to amount to \$30,000. The property will be known as the "Nil Desperandum," and will be operated with J. Olson as superintendent.

#### TELLER COUNTY.

The country from Bernard creek for 3000 feet is to be prospected with a diamond drill by the Metallic G. M. Co. Its tunnel is now in 800 feet and before further advance the diamond drill is to be used.

The Consolidated Mines Co. has incorporated, capital \$2,500,000, of which will be issued to the original companies 1,900,000 shares. The Bull Hill Con. will receive 900,000 shares, 600 shares of the new distributed to the stockholders for every \$1000 of the old. The Consolidated Gold Mines stockholders will receive 1,000,000 shares.

The Wacu Weta claim of the Marroon Tunnel Co. has been bonded at \$100,000 for twenty months.

The New Zealand Con. G. M. Co. has been incorporated, merging the New Zealand G. M. Co., the Trachyte G. M. Co. and the Compromise G. M. Co. of Cripple Creek; capital \$1,000,000. Of the capital stock the New Zealand stockholders receive share for share on 600,000 shares out. The Trachyte receives 165,000 shares for the mine and appurtenances. The Compromise Co.'s capital stock of 30,000 shares is cancelled. The holdings of the new company embrace twenty-one acres of mineral-bearing ground. The officers are W. Woods president, H. E. Woods treasurer, F. M. Woods secretary and general manager.

#### IDAHO.

#### BLAINE COUNTY.

The shaft of the Tiptop mine, Hailey, is down to the 700-foot level. A station is being opened and as soon as the drifts are started each way the work of sinking will be resumed. It is the intention of the

management to continue to the 1000-foot level.

#### ELMORE COUNTY.

A strike has been made in the Homestake mine at Neal at a depth of 200 feet, a body of ore being discovered by a cross-cut from the lower tunnel. This discovery is of importance to the entire district. It is understood that C. Balbach, the Supt., has ordered a raise through this ore to the upper tunnel level.

#### IDAHO COUNTY.

The shaft sunk 177 feet deep on the Delhi claim, on Shaw mountain, has cut the ledge, which is from 6 to 8 feet wide. The ore is not free, the gold being contained in iron pyrite.

W. H. Marshall for two years last past has been developing mines in the Carbonate Hill district, in the Seven Devils section. He says: "My partner, R. W. Stevens, and I have seven claims on Carbonate hill, which we have developed with a 60-foot tunnel. The ore body is of immense size and is rich in both gold and copper. All that district is now waiting for the building of railroads. The Potatello & Idaho Northern and the construction of the Little Salmon wagon road will afford relief, as ores that are rich enough to stand a short haul on wagons for the flux necessary to successful smelting will not stand a long haul over a rough country to the present terminus of the road. There are fully 100 men in the Carbonate Hill district, and perhaps twice as many in and about Cuprum."

The shoot recently struck in the Iowa mine at Quartzburg has been followed 150 feet. It is from 4 inches to 1 foot wide, the ore averaging \$200 a ton.

#### KOOTENAI COUNTY.

A carload of ore shipped from the Conjecture, on Lake Pend d'Oreille, gave \$1200 net after paying freight and smelter charges. The average was 115 ounces in silver to the ton. The returns are counted extremely satisfactory by officers of the company. The property is employing about eighteen men. A survey is to be made at once for a new tunnel, which would do away with hoisting.

#### OWYHEE COUNTY.

D. B. Huntley, E. V. Alford and T. Davey are about to begin development work on the Afterthought group on War Eagle mountain, near Silver City. They propose to sink a shaft and are arranging to put on a hoisting plant. These claims are south of the properties that the War Eagle tunnel is designed to develop. Mr. Huntley believes that the Golden Chariot vein runs south from the old properties on the mountain and has located the group on this theory.

F. Lepage, since last June, on the Lepage group at DeLamar, has developed some fine bodies of ore.

F. Irwin, superintendent of the work of the War Eagle Co. at Sinker Creek tunnel, states that the tunnel was now in 4100 feet and was being advanced at 9 feet a day towards completion at 6300 feet. He expects at about 5000 feet the tunnel will begin to cut some of the ledges that were so rich in the early days when mined nearer the surface.

R. H. Britt, Supt. of the Poorman mine at Silver City, says that his development work was following the old shoot and had opened up considerable good ore.

#### MONTANA.

##### FERGUS COUNTY.

Jones, Matthews & Miller have optioned the Mammoth group of claims, Gilt Edge district, to W. L. Lawrey of Roseland, B. C., reported to be the representative of New York capitalists. The option covers eight claims joining the Great Northern M. & D. Co.'s properties, and part of the great ore deposits on the porphyry carboniferous lime contact. The option is at sixty days, \$100,000 in one year. The average assay values are about \$8 per ton and mill tests show them adapted to cyanide treatment. Two shifts have commenced work on the ground.

The bullion shipment from the Kendall mine, in the North Moccasin, on May 18 was \$5000. Work on the new mill by Finch & Campbell Co. will be commenced about June 1.

Lewistown, Mont., May 20.

The Blue Dick, Azurite and Pauper's Dream claims on Elk creek have been bonded by T. E. Collins, P. Gibson and P. H. Hughes to O. Schoenfeld of Great Falls, who has begun work. The bond is for \$6000, until May 1, 1902.

#### LEWIS AND CLARKE COUNTY.

T. Hird, T. B. Garrison, W. F. Clarke and M. Mitchell of Spokane have bought the Ophir Nest and two other claims on Ophir gulch, near Helena. The ore assays from 16% to 18% in copper, with some silver and gold. The pay streak is from 20 inches to 2 feet in width. The ore is copper pyrite, with occasionally copper glance. The owners propose the sinking of a shaft 200 feet at once.

#### MADISON COUNTY.

The old Black Chief mine, near Pony, has been bought by J. W. Northey and J. Martin. The mine is a free-milling proposition, with a vein 3 to 8 feet wide, and assays up to \$68. A large number of tons have been milled and a fair saving made; but cyanide treatment is required for the tailings. The new owners will put up a whim and sink on the ledge.

#### NEVADA.

##### ESMERALDA COUNTY.

A phenomenal assay is reported from Tonopah. It showed \$17,520 gold, \$560 silver. Between 6000 and 7000 sacks of ore of good grade have already been shipped.

The Vulcan Co. are said to have put on twenty-five more miners. It is reported that a large body of good ore was recently encountered in the lower workings of the Parrott mine.

J. H. Lee says his tunnel at Huntoon valley, near Hawthorne, has cut the ledge, finding quartz rich in gold. The tunnels in 900 feet, and the ledge in the face 400 feet below the surface.

J. C. White, of Independence, Inyo Co., Cal., says of Tonopah: Butler postoffice will soon be in full running order. It is named for Tonopah's discoverer. W. W. Booth is about ready to start his newspaper. From one to four carloads of merchandise and lumber arrive at Soda by every train for the camp. The chief shippers say that many more teamsters can find something to do, but freight rates will probably be reduced before long. The stages are loaded with passengers. The trip is made in two days, all in daylight. Building is going up as fast as lumber can be obtained. A mine owner was asked what his richest ore was worth, and in reply he pointed out two sacks valued at over \$500. Water is still scarce. The springs are guarded, and water can be obtained in the town only. Living and team expenses are necessarily high. Water for a team for twenty-four hours costs a dollar, and feed is by no means cheap.

##### STOREY COUNTY.

The Ninnis brothers of Silver City have bought a one-half interest in the Cora J. and all of the Boer claim owned by the late J. Keiger.

##### WASHOE COUNTY.

The Copper Queen mine in Copper Gulch, near Reno, has been bonded. This property was discovered a year and a half ago, and a 60-foot shaft sunk on the ledge made a good showing of ore.

##### WHITE PINE COUNTY.

J. P. McOmie, W. N. McGill and W. G. Lyons, owners of the Maggie group near Robust, are sinking a prospect shaft 100 feet.

#### NEW MEXICO.

##### COLFAX COUNTY.

Two mill tests of ore from the Ajax mine, Elizabethtown, gave in amalgam \$15.50 to the ton, the other \$12.50. The tailings assay, after passing over the plates and concentrator, was \$32. Other tests have proven it a suitable ore for cyanide treatment and a cyanide plant will be put in. C. C. Forrester is manager.

##### GRANT COUNTY.

Improvements are planned at the smelter of the Silver City Reduction Works to double the present capacity. A new furnace with a capacity of 200 tons is to be built.

A gold quartz discovery has been made near Central. For many years placers have been worked, and it is now believed that the lode source has been found. Some very high assays have been made, and the general average will run well up.

A. Wallis will shortly erect a small concentrating plant at Stein's Pass for the purpose of treating the concentrating ore, of which several good finds have recently been made.

The new 10-stamp mill of the Wilson M. & M. Co., at Stein's Pass, has been completed and tested satisfactorily. The 5-mile pipe line from the Animas valley, bringing the water supply, has been found to be too light for the pressure and has to be replaced before operations can be commenced. The new mill has a capacity of twenty-five tons daily. J. Rutherford is manager.

##### SIERRA COUNTY.

A strike is reported from near Rincon. A ledge carrying gold, silver and lead, assaying \$54 a ton, has been discovered. Mrs. M. Ralph, J. W. Howard and J. Stewart, of Rincon, are the owners.

#### OREGON.

J. R. Cassin of Spokane, secretary of the Alamo Con. M. & M. Co. of Alamo, with Engineer F. D. Stanley is surveying the Alamo ground preparatory to raising from the 300-foot level to the upper workings and to outline the work for the erection of a stamp mill. The mine has been

extensively developed during the last year and it is said to have a large amount of ore blocked out. The vein is 30 feet wide 300 feet down and carries free gold.

#### UTAH.

##### BOX ELDER COUNTY.

The Copper Mountain group, owned by the Lewisohns of New York, have begun the shipment of ores for trial.

##### JUAB COUNTY.

It is said that the Red Rose Co. have refused a cash offer of \$150,000 for the Red Rose group at Tintic. V. McCune is manager.

##### SALT LAKE COUNTY.

The Wasatch King M. Co. has incorporated, capital \$300,000. F. F. Stoll is president, and J. W. Langley, secretary. The company owns the City Rock and eight other mining claims in the Little Cottonwood mining district.

The directors of the United States M. Co. at Bingham have voted to erect a 1000-ton smelter from plans furnished by Mr. Fisher. Arrangements have been made for starting the construction, and it is estimated that about nine months will be required to complete it. Contracts will be let immediately. The cost will approximate \$500,000. The smelting plant will be of the most modern type and combine the best features of the Bingham, Highland Boy and Boston & Montana smelters. Mr. Fisher has also introduced many new ideas and improvements of his own invention in connection with the plans.

##### TINTIC COUNTY.

An amendment to the incorporation of Tintic M. and Dev. Co. has been made, increasing capital stock from \$1,500,000 to \$3,000,000.

##### TOOELE COUNTY.

The Overland mine and mill, of which G. A. Duncan is manager and M. D. Stackpole Supt., is situated on the Sunshine side of Mercur district. This is a low-grade proposition, having large bodies of gold-bearing ore in a talcose-chert vein formation, between lime walls that stand from 10 to 18 feet apart. The ledge has a north and south strike, with a pitch eastward of about 15 degrees. The talcose material is next to the hanging wall, the chert lying against the foot wall. The talc appears much altered from ordinary talc, as if it had been calcined by heat. In this form it does not offer the resistance to percolation in the cyanide leaching tanks that usually comes from talc in its normal state. At all events, a mixing of the chert and talc in the vats renders percolation quite perfect, as the chert is a highly siliceous material. The values extracted consist of gold exclusively, the method being the simplest form of cyanide work, the ores requiring no roast. The leaching capacity of the plant is about 500 tons of ore daily, and at present the mill is operating at about full capacity. About 1800 tons are constantly in course of treatment, the time required for a given quantity to pass from crushers to waste dump being three and a half days. The values left in the tailings amount to from 20 to 40 cents per ton of ore treated. The ore is delivered automatically from the hoisting skip to the No. 5 crusher; thence elevated to supply bin at top of mill; thence through two No. 3 Gates crushers; thence through revolving screens, the oversize from screens returning to crushers; thence to 3-mesh rolls and elevated to pulp bins, from which it is delivered by Jeffrey belt conveyors to the leaching tanks, the coarsest being 3-mesh, though much of it is a great deal finer. The mine hoist and all mill machinery are run by electric power, transmitted 40 miles from the Provo plant. This power comes over the line from Provo canyon to Mercur at 40,000 volts, where it steps down to 5000 volts in transmission to Sunshine. At this mill are sets of transformers that reduce it to 220 volts for mill work. There are at the mine and mill thirteen motors, aggregating 350 H. P.

The mine is operated through a vertical shaft that sinks 450 feet, cutting the vein on its dip at that depth; here the shaft changes to an incline, following the dip of the vein 350 feet deeper. A skip holding nearly two tons of ore is operated between the collar of the vertical and the base of the incline, delivering from 300 to 325 loads of ore to the crusher floor of the mill every twenty-four hours. At the point where the vertical shaft strikes the ore body, at 450 feet depth, is what is called the 700-foot level, being at 700 feet depth from the surface on the dip of the vein. This level runs 1000 feet north and 600 feet south of the shaft and is provided with car trackage leading to the shaft, being the main hoisting level for the numerous sub-levels from the 700 up to the surface. One main shoot extends from this 700-foot level to the surface, along the foot wall, and is the channel through which all the ore from the upper levels is conveyed to

the loading bin on the 700, and thence dropped into cars and taken to the hoisting skip. The method here is to run sub-levels on the vein both ways from the main chute, each about 100 feet above the other, then run upraises from level to level, blocking out the ore. There are forty-five of such raises. Then stopes, each about 40 feet wide, are carried upward, leaving pillars of ore standing for support. The ore stoped is carried in cars on the sub-level to the main ore shoot that discharges on the 700-foot level. From the 700 down to the 12th the same system prevails, except that each sub-level connects direct with the incline that carries the skip. On each of these levels is a skip bin, holding about thirty tons of ore, built right over the incline. By an excellent system of electric signals to the hoisting engineer the skip may be stopped on any sub-level and loaded automatically from the skip bin above it. Thus the ore is being broken down and hoisted from twelve levels that run on the vein at regular distances from near the surface down to over 1000 feet depth on the dip of the ledge. The material between the walls is practically all milled.

WASCOTT.

Sunshine, May 24.

J. Burke left for Stateline last night, and will remain there until the new \$80,000 mill, which is to be erected by the Ophir Co., has been completed. The foreman for Messrs. Dederichs & Burke, to whom the contract for the plant was awarded, is already upon the ground, where excavation has begun and with the orders for the material and machinery all in hand, no trouble should be experienced in completing the plant within the time specified by contract.

#### WASHINGTON.

##### FERRY COUNTY.

Olney & Blair of Republic worked four hours shoveling in sluices on the discovery placer claim near there, and made a clean-up of \$100.

##### SNOHOMISH COUNTY.

The Sunset mine, at Index, is preparing to put in a compressor plant and air drills. When the flume and compressor plant are completed the 600-foot tunnel to cut the ledge 350 feet down will be started. The company are also considering putting on a diamond drill to more thoroughly prospect the several ledges at depth.

##### SPOKANE COUNTY.

It is said a smelter will be erected in Spokane if sufficient inducements are offered. P. A. Daggett, Secretary of the Montana M. & Dev. Co., says the company now owns 15 mining claims in British Columbia, northern Washington and Idaho, and has experts looking after promising prospects. Spokane is the central place for a smelter for these mines.

#### WYOMING.

##### CARBON COUNTY.

Over \$2,500,000 have already been spent in opening up copper mines in Grand Encampment district. Eight new towns have been started—Encampment, Copperton, Battle, Riverside, Rambler, Rudefehah, Downington and Pearl. The last named is just across the State line in Colorado. They already have about 600 completed buildings in all, and represent in mercantile and other similar businesses more than \$300,000 of invested capital. Seventeen steam plants have already been installed. Two concentrators, the only ones in the State, are now at work, and there is also a smelter at Encampment, the only one in Wyoming. The county recorder's books at Rawlins show several thousand mining claims located in the Grand Encampment country. By far the larger number have been developed only sufficiently to comply with the mining laws for holding. On several hundred claims work is being pushed, and among these are many that show excellent bodies of ore. It is estimated that nearly fifty prospects there could be paying mines if railroad facilities were at hand or local treatment of ores could be had. At present there are four mines shipping ore in quantity. These are the Ferris-Haggerty, Rambler, Evening Star and Cox.

#### FOREIGN.

##### BRITISH COLUMBIA.

Development work is being continued at the Athabasca mine, near Nelson, and the mill tailings will be treated by the cyaniding process.—The strike at the Silver King mine has been confirmed. It is claimed that the ore body is 8 feet wide and assays 120 ounces silver and 7% copper.—The May and Jennie mine is being developed, and a 10-stamp mill is being constructed. J. J. Fleutot is manager.—Work on the Noble Five, at Slocan, has developed the Last Chance vein.—The Black Prince group is leased to G. Gormely and associates, who are taking out some shipping ore.—At the Won-

derful, near New Denver, another vein 2 feet wide has been found. Assay shows values of 115 ounces silver.—The St. Eugene mine, at Moyle, has started up, employing 200 men.—The Eva group on Lexington mountain is being worked by the Imperial Dev. Syn. of Nelson. Large bodies of high-grade free-milling gold ore have been opened up. A. F. R. Nelson, B. C., May 21.

The sale of the Giant at Roseland to C. H. Mackintosh has been made at about \$175,000. Stockholders in the present Giant Co. will get stock in a new company at a rate of a little less than 7 cents a share. Mr. Mackintosh undertakes to form a London company, to be known as the Giant Mining Co., Ltd., with a capital of £200,000. A working fund of \$250,000 will be placed in the treasury. The new company will commence work next month.

Reports from Ottawa state that the Dominion Government has decided to give a bonus of \$5 per ton on Canadian refined lead to and not exceeding \$100,000 in any one year. The bonus is to be available in the same way as the iron bounties.

The Canadian G. F. Syndicate will commence work at once on the Commonwealth group, on Hooker creek, near Nelson, which they bonded last fall. The ore carries gold, silver and lead. Considerable work has been done on the property, but the November storm last winter made it necessary to suspend until spring.

The official estimate of the last monthly mill run at the Ymir mine is: Eighty stamps ran 29 days 18 hours. The estimated profit on operating is \$27,500.

The amount disbursed at Roseland by the mines in wages and supplies for April closely approximates \$225,000.

#### CUBA.

"The mineral resources of Cuba are of greater variety and extent than has been supposed." So says C. W. Hayes of the U. S. Geological Survey, who has just made a reconnaissance of Cuba and the Isle of Pines. While there he visited Havana, Matanzas, Pinar del Rio and Santa Clara provinces. His assistants, T. W. Vaughn and A. C. Spencer, remain to complete the survey. In Matanzas province there are copper, iron and asphaltum, and on the Isle of Pines marble of exceptional quality, which includes the finer grade of monumental marble and building material. In Santa Clara province there are copper and asphaltum. Iron ore deposits are larger than those of Pennsylvania and compare favorably with the Lake Superior deposits. They are found along the coast near Santiago, very accessible to transportation. Copper was found in big deposits near Santiago, which were worked extensively until stopped by the ten years' war. In the same province are found almost inexhaustible deposits of manganese. The mining laws of Cuba open the country to American prospectors. Mineral locations can be secured on any part of the island, irrespective of the present ownership or occupancy of the land. The amount and shape of the claim is to be determined by the person making the entry. The cost of taking out a patent is \$60 for an area of 500 by 1000 meters and an additional charge is made of about \$1.50 per acre for additional mineral land. The fee covers the cost of survey.

#### KLONDIKE.

J. Hall has sold an interest in part of 17 above in El Dorado for \$60,000. The interest conveyed is regarded as rich and the price obtained is not looked upon as high.

#### MEXICO.

The Cienegita M. Co., capital \$10,000,000, has been incorporated by J. M. Ford and Col. W. Christy of Phoenix and W. H. Barnes of Tucson, to control a company owned by the same people in Mexico, which own concessions in Sahuripa, in Sonora, of copper mines that carry gold and silver. Nine groups of ancient mines are included. The company plans to construct a 200-mile railroad to Guaymas, to have ocean transportation. Reduction works will be erected at the mine, and matte will be shipped.

#### PHILIPPINE ISLANDS.

C. H. King of Oakland, Cal., has gone to the islands in charge of a large and well appointed exploring party to examine thoroughly the mineral and timber resources of the island of Mindanao for a strong syndicate of Eastern and California people. They propose, if the reports are satisfactory, to incorporate, with a view to developing on a large scale the mineral and timber resources, and engage in commercial exploitation as well. A steamship line is a part only of the plans yet in a formative stage. Among those interested and backing the exploration party are W. H. Talbot, F. M. Smith, J. A. Clunie, G. W. McNear, Sr., and W. G. Henshaw, all of San Francisco, Cal., who constitute the temporary Board of Management. Of

this Board, Mr. Smith has been made treasurer and Mr. Henshaw secretary.

#### WEST AUSTRALIA.

The annual report of the Golden Horse-shoe Co. shows 67,095 tons ore milled, yielding \$1,315,000 in the mill; 33,418 tons of tailings cyanided yielded \$390,200; 25,922 tons of slimes treated yielded \$212,500; and 10,023 tons of sulphide ores and concentrates sold to smelters yielded \$364,700, making a total value obtained of \$2,282,400. The net profit earned was \$1,400,300.

#### Personal.

R. O'BRIEN of Spokane, Wash., has returned there from Hornitos, Cal.

JOHN NUMAS of Plymouth, Cal., has been appointed foreman at the App mine, Tuolumne Co., Cal.

J. H. WEBER, M. E., of Oakland, Cal., has gone to Ely, Nevada, to make a mine examination for Eastern people.

JOHN EDDIE, formerly superintendent of the Pennsylvania mine at Grass Valley, Cal., has gone to Nome, Alaska.

THOMAS FRAZIER of El Dorado Co., Cal., has taken possession of the U. S. Land Office at Sacramento, Cal.

W. MCG. LOGAN, superintendent of the Old Home Con. G. M. Co. at Blue Tent, Nevada Co., is in San Francisco.

EDWARD SKEWES, formerly of Colorado, is examining mines in Ashantiland, West Africa, for a London company.

W. A. SHERMAN, who has been prospecting for oil at Bolinas, Cal., returned to Salt Lake City, Utah, on May 26th.

PERCY WILLIAMS, superintendent of the Century mine, Box Elder county, Utah, was in Salt Lake City, on May 27th.

PHILLIP MIXSELL of Idaho Springs, Colo., has been appointed superintendent of the Cashier mill at Breckenridge, Colo.

JOHN HAYS HAMMOND, who has been in California for some time examining mining properties, has returned to Denver, Colo.

W. MEIN of San Francisco has been appointed manager of the Roodeport Durban Deep G. M. Co. at Johannesburg, Transvaal.

J. E. BEVERIDGE, who has been in Mexico examining the Sivirojoa Minium mines, has returned to his home, Salt Lake City, Utah.

B. S. REVETT of Breckenridge, Colo., has returned from Mexico and is now engaged in superintending the American Gold Dredging Co.

HENRY TURLEY is to be superintendent of the Black Queen mine, at Crystal, Colo., taking the place made vacant by the death of Amos Fraser.

M. CLEVE of Paris, consulting engineer of the De Lamare Syndicate, is at Atlin, B. C., directing the opening of the company's property at that place.

H. W. TURNER has resigned his connection with the U. S. Geological Survey and has engaged in practice as a mining engineer in San Francisco, Cal.

A. A. JOHNSON, general manager of the Columbia Hy. M. Co. of Atlin, B. C., is in Victoria, B. C., securing machinery for the mines under his charge.

W. T. FRAZIER, superintendent of the High Point mine at Stent, Tuolumne Co., Cal., is temporarily in charge of the same company's property at Lead, S. D.

F. M. ANDERSON has been appointed a field assistant of the State Mineralogist to make a report on the Shasta copper-bearing belt and has started at the work.

PROF. EBERHARDT FRAAS, a director in the Royal Museum at Stuttgart, Germany, is making an extended trip of geological investigation through Colorado.

MR. R. J. CORY, manager Denver office of the Edward P. Allis Co., has recently returned to Denver from an extended trip through Mexico and Arizona.

S. W. BOWERS, field assistant to the State Mineralogist, has gone to San Diego county to examine the section around Carriso creek with reference to its oil possibilities.

J. W. BENNIE has resigned the superintendency of the smelting department of the Mountain Copper Co. at Keswick and goes to Mexico to accept a similar position with one of the largest companies there.

#### Obituary.

GEORGE W. TOMB of San Francisco, whose death occurred in Sonoma county May 21st, was for many years prominent in the wire rope and cable business of the Pacific coast, having been identified at different times with the California Wire Works, the Washburn & Moen Manufacturing Co., and latterly with the American Steel & Wire Co.

### Latest Market Reports.

SAN FRANCISCO, May 29, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 50c San Francisco, 48½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £69 1s 3d per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 8s 9d per ton=2.70 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 100-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13½c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 29c; bar tin, \$3, 34½c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.00 ½ flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 ½ lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BARBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS.—F. o. b. New York 50¢ 60c ½ lb.

ASSAY LITHARGE.—San Francisco, 10c ½ lb. small lots.

BISMUTH.—New York, ½ lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 ½ lb. lots.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, ½ lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50¢ 60c ½ lb.

PLATINUM.—San Francisco, crude, \$22 ½ oz.; New York, \$22 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c ½ set; 14 oz., 40s., 9½c.

#### Commercial Paragraphs.

THE Ericsson Telephone Co. of 296 Broadway, N. Y., have received an order from which it appears that Ericsson telephones are in use in Deccan, India.

THE New Process Raw Hide Co., Syracuse, N. Y., has recently shipped one of its new process noiseless pinions to Germany to be used on the private yacht of Kaiser Wilhelm.

THE Edward P. Allis Co. have just closed a contract with Compania Minera de Penoles, Estado de Durango, Mexico, for the additions to this company's present lead-silver smelting plant. The new work will consist in part of six new blast furnaces, eight Holthoff-Wetthey roasting furnaces, cooling and conveying furnaces, crushing rolls, and also two gross compound direct connected generating Corliss engines.

THE Sullivan Machinery Co. of Chicago have recently become successors to the M. C. Bullock Mfg. Co., and in future will manufacture the complete line of diamond drills, rock drills and mining machinery formerly put on the market by the two concerns. Two new buildings enlarging the plant have lately been erected and are

now almost ready for use. Their Western agencies have been recently extended to the Pacific coast, and now in addition to the Denver office in charge of R. D. Hunter, a branch office has been opened in Spokane, Wash., under the management of M. J. Ready.

#### Books Received.

John T. Davis of Jackson, Cal., in writing what he names "History of the Mining Laws of California," as a part of a new "History of the Bench and Bar of California," has filled in a place left untouched by commentators and discussers of the law. What at least the older lawyers of California knew he has written in graceful words, and in doing it has given a service to lawyers all over the western half of the United States; for no one before him has taken the novel phases of mining law which have originated in California, and, bringing them together in historical sequence, written the story out. Mr. Davis' historical sketch will be a reference book for the younger lawyers and students, and is entertaining reading for miners who have yet to make an intimate acquaintance with mining law through litigation over the locus of a lode apex.

#### New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St. S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 21, 1901.

674,834.—DENTAL CROWNS—Brewer & Burfield, S. F.  
674,833.—GOLD SEPARATOR—J. Broyles, New Whatcom, Wash.  
674,597.—LIFE BOAT—C. Buckel, S. F.  
674,624.—AMALGAMATOR—J. V. Byers, Descanso, Cal.  
674,757.—SADDLE BUCKING ROLL—F. R. Clark, Portland, Or.  
674,731.—SUSPENDER END—C. H. Dome, Prescott, Ariz.  
674,679.—PRAKE SHOE—Gilman & Brown, Tacoma, Wash.  
674,504.—SAD IRON—T. F. Hagerty, S. F.  
674,839.—ANCHOR—D. M. Hastings, S. F.  
674,733.—STAMP AFFIXER—A. S. Heintz, Portland, Or.  
674,609.—VALANCE SUPPORT—J. M. Higley, Niles, Cal.  
674,581.—GARMENT SUPPORTER—M. A. Irving, Victoria, B. C.  
674,649.—FURNACE—S. A. Knapp, Hawthorne, Nev.  
674,444.—SHAFT COUPLING—J. J. Kocher, Los Angeles, Cal.  
674,563.—GOLD SEPARATOR—W. A. R. Looze, Provo, Utah.  
674,630.—TONGUE HOLDER—J. A. W. Lundborg S. F.  
674,425.—BRUSH CUTTER—L. N. Wilson, Fresno, Cal.  
674,708.—CABLE GRIP—C. Noble, Sisson, Cal.  
674,703.—EXPANSION B.T.—E. North, Los Angeles, Cal.  
674,516.—DUST PAN—A. Olson, San Diego, Cal.  
674,844.—WRENCH—W. H. Peters, Hoquiam, Wash.  
674,566.—CASH CHECK DEVICE—Shirek & Lerond, S. F.  
674,748.—CLOSING SPACES BETWEEN RAILS—E. Wade, Los Angeles, Cal.  
674,530.—CAN TOP—G. Wilcox, Los Angeles, Cal.  
674,526.—DESIGN—A. Phillips, Seattle, Wash.

#### Recently Declared Mining Dividends.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LIFE SAVING BOATS.—No 674,597. May 21, 1901. C. Buckel, San Francisco, Cal. This invention relates to a closed compartment vessel especially designed as a life saving and passenger boat. It consists of outer and inner concentric shells, an interior longitudinally suspended swinging compartment, with independent castings fitted to the ends of the vessel and having valve seats at their inner and outer ends. Guided ball valves move in the chambers by gravitation or pressure to close against either seat, one of said castings being removable to allow the passage of the anchor chain or cable.

APPARATUS FOR SEPARATING METALS FROM THEIR ORES.—No 674,563. May 21, 1901. W. A. R. Looze, Provo, Utah. This invention is particularly designed for the reduction of the carbonates and oxides of copper to metallic copper, though it is also applicable in other metallurgical operations requiring continuous treatment and where it is desired to apply the heat exterior to the containing vessel. It consists in the combination of a furnace, a plurality of inclined muffles within said furnace, and means for delivering ore there to the muffles in each horizontal row having their discharge ends projecting beyond the ends of those muffles beneath, and adjustable caps upon said discharge ends for regulating the discharge of ore.

MANIFOLD CONTINUOUS CASH CHECK DEVICES.—No. 674,568. May 21, 1901. S. W. Shirek, C. Shirek & F. Lerond, San Francisco, Cal. This invention has for its object the furnishing of a simple, cheap and compact apparatus wherein the

**THE S. H. SUPPLY CO.,**

**THE MACHINERY DEPOT OF THE WEST,**

22d and Larimer Streets, DENVER, COLO.

During the past three months we have dismantled three mills: the Royal Gorge Mill, Canon City; the Oneida Reduction Works, Victor, Colo., and the Gold Brick Mill at Gunnison, Colo. The first of these was in actual operation less than thirty days; the second, ninety days, and the third one year. In all of these mills amalgamating machinery was used, and the consequence is that we have a great assortment of this class of machinery. For use it is as good as new in every respect. We are offering this machinery at a saving of from 50% to 75% over the cost of new machinery. We have:

- 14 Standard Amalgamating Pans.
- 78-Foot Settlers.
- 4 Cleanup Pans.
- 8 Amalgam Safes.
- 15 Quick Elevators.
- 4 Amalgam Cars.
- 5 Quick Tanks.
- 3 Retorts and Bullion Furnaces.

Two of these mills were dry crushing, containing the following roasting and drying machinery:

- Howell Improved White Roasting Furnace (60x27).
- 3 18-Foot Revolving Ore Dryers.
- 1 Bruckner Roasting Furnace.
- 1 40-Foot Pierce Roasting Furnace.

All of these plants were fully equipped with power, including Corliss engines (18x42); tubular boilers and Heine water tube boilers; feed water heaters, and pumps.

Thousands of feet of rubber and leather belting, shafting, pulleys and hangers are in our warehouses. Write for our prices.

The air compressors we have in stock and can make immediate shipment on, are:

- 12x14 Ingersoll-Sergeant.
- 16x14x10 1/2 Norwalk.
- 12x14 Rand.
- 10x12 Knowles Belt Driven.
- 6x8 Knowles Belt Driven.

Our new catalogue is just issued and we will send you one if you ask for it. It contains a large amount of good information in regard to prices, as all of them are put in plain figures. No discounts. Send for it.

MAKE THIS SMALL

## DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes  
or Underground Work,

USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"THE DANIEL BEST"

50 Horse Power

## TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,
San Leandro, California.

THE COMMON SENSE WHIM

Is made of the best wrought iron and steel. Compact and light; can be conveniently moved, carried by pack animals anywhere. If accident occurs the deadlock saves the load. : :

SINKING PUMPS,

Indispensable in sinking mining shafts or pumping out flooded mines. Easily raised or lowered by cable or rope. Equipped with outside packed plungers. Handles gritty or dirty water. Operates bolted to shaft timbers or only suspended by cable at any angle. Packing glands external. May be adjusted while in motion. Removable parts hinged. Steam movement positive and simple.

SAN FRANCISCO, CAL.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/2" wide by 1 1/2" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : S. K. SNODGRASS, Denver, Colo. (The Windsor.)

GATES IRON WORKS

The Copper Furnace herewith reproduced is one of two sold to the GRANBY CONSOLIDATED MINING AND SMELTING CO., LTD., BRITISH COLUMBIA. The size is 44x160 inches. These two furnaces were sold on a guaranteed capacity of 500 tons per day. Before the furnaces had been in operation a month they developed an average capacity of 600 tons per day, and the highest daily record has exceeded 735 tons. The cost of operation has steadily declined under the management of General Manager Hodges, until six-dollar copper ore is paying a handsome profit.

FULL DETAILS OF OUR SMELTING FURNACES GIVEN IN OUR NO. 11 BOOKLET.

All of GATES IRON WORKS machinery is as good as it is represented to be, and often much better. We build every modern type of apparatus for the reduction of the precious ores by every established process. Our three great lines are these:

**Mining
Machinery,
Rock and Ore
Crushing
and
Cement
Machinery.**

WE BUILT THE FIRST STAMP MILL ERECTED IN THE ROCKY MOUNTAINS.

WE PUBLISH FOR THE USE OF INTERESTED PEOPLE, 17 BOOKLETS DESCRIBING OUR MACHINERY.

Main Office and Works, 650 Elston Ave., CHICAGO.

WOODBURY'S SIDE SHAKE CONCENTRATOR.

THIS Concentrator is superior to any other Belt Machine. It has an iron frame, steel shaking frame, and built in the most thorough manner. The patent distributing device distributes the pulp evenly over the whole working surface of the belt; thereby it enables the machine to perform perfect work, and giving more capacity to the Concentrator than any other Belt Machine. The variable eccentric crank gives the machine greater capability to work different classes of ore. I will warrant this machine as having more capacity than any other Concentrator.

Simple in Its Construction - Saves Fine Sulphurets -
Without Loss in Tailings
- Makes High Product - Capacity from 5 Stamps

Send for Catalogue. **GEORGE E. WOODBURY, 223 FIRST ST., SAN FRANCISCO, CAL. 'Phone Main 1766.**

THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable.
Will take ore from finest mesh up to 6-mesh without sizing.
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

PATENTS

DEWEY, STRONG & CO., San Francisco, Cal., and Washington, D. C.

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

DEWEY, STRONG & CO., 330 Market St., San Francisco, Cal., or 918 F St., Washington, D. C.

A ROOFING OF QUALITY.

P. & B. Ready Roofing is first quality through and through—every layer and composition in its make-up is there for good and necessary reasons.

It is made to withstand the ravages of the elements and it will outlast and outwear any other prepared roofing.

P. & B. Ready Roofing is the simplest and easiest roofing to lay, for anyone can do it. Owing to its compactness and manner of preparation it can be transported at less cost and at less trouble than any other roofing.

Booklet is free and tells all about laying P. & B. Roofing—send for it. Address Department A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

CRUSHERS FOR ASSAYERS.

BRAUN'S ORE SAMPLE CRUSHER AND PULVERIZER.

HAND OR POWER.

A machine that crushes and pulverizes at one operation, re-

This is a compact, rapid and effective crusher. Cleaned and operated quickly and easily. All parts renewable.

Crushes from two inch to ten mesh. An ideal laboratory

crusher, as the parts are few; and as it is so readily cleaned,

there is no danger of salting subsequent samples. Made in two sizes for hand or power.

reducing an ore from two inches in diameter to a eight or twelve powder. The ore is crushed against the upper jaw and pulverized between the vibratory jaw and the roll. Back motion of roll is prevented by small rolls or chokes. Easily adjusted and operated.

Write for our illustrated circulars of these and other labor-saving devices.

SOLAR HOUSE LIGHTS
 For houses not having gas or electric
 light service, and for those that have,
 but wish economy and independence.
 Costs **\$4.00** Per Light
EACH LIGHT LASTS A LIFETIME
 Gives a steady light, brilliant as electricity,
 and whiter. Exceeds any town gas service in
 existence. No complications; nothing to get
 out of order. Simple as A, B, C. Handy as a
 "candle"—jets can be carried around anywhere
 in the house. Gas cannot escape, like from the
 town mains. No smell, no smoke and no dan-
 ger, as with kerosene or gasoline. No accident
 of any kind possible, and the whitest, steadiest
 and richest light that is known.
 Write us for particulars.

No. 1 Special Button Balance with 5-inch beam. Sensibility
 1-200 Milligramme. Made for particularly accurate and rapid
 work and is guaranteed to be the finest balance on the market.
 It is the balance used by Prof. Forsythe of the Lawrence Scien-
 tific School, Harvard University, for scientific research. Send
 for Catalogue A, illustrating and describing a full line of assay
 and analytical balances, to

Wm. Ainsworth & Sons,
 (Successors to WM. AINSWORTH.)
 DENVER, COLO., U. S. A.

 H. S. Crocker Co., San Francisco, Cal., Agents for the Brunton Patent Pocket Transit.
 Pacific Optical Co., Los Angeles, Cal., Agents for the Brunton Patent Pocket Transit.

The adjusting device will appeal to
 the assayer as the simplest and most
 convenient means of checking the
 beam, and consists of a star wheel on a
 threaded arbor, mounted on the center
 edge back of the beam.
 By turning this wheel backward or
 forward, it is moved along the arbor
 and so adjusts the beam to equilib-
 rium.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quick-silver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries. SEND FOR DESCRIPTIVE CIRCULAR.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

A Machine That Has Passed the Test

READ WHAT OTHER PEOPLE SAY OF IT:

Mr. A. S. Gordon, Elkhart, Colo., April 26, 1900.
"Your 'Wonder' Placer machine is the greatest
gold saver I have ever seen. It saves the finest
Flour Gold. With an 8-inch machine one boy and
myself will wash 3 tons of gravel per hour."
From Mr. T. E. Andrews, Mansfield, Sonora, Mex-
ico, April 26, 1900. "It is the greatest machine of its
kind in existence. It saves every ounce of gold and
the operation is truly marvelous."
From the Johnson Assaying Co., San Francisco,
April 26, 1900. "We have tested your machine thor-
oughly and are greatly pleased with it. It saves
all the gold and is the best machine of its kind we
have ever seen."

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging out-
wardly as it passes over the pulley. This re-
lieves the strain from the top and bottom of the
edge by directing the strain automatically to
the inside face surface of the edges. Here-
before all belts have been so constructed that
when they pass over the pulleys or rolls, a di-
rect strain comes upon the top or at the base of
the edges, causing the edges to break away
from the body of the belts in a very short time.
We avoid this Mechanical Defect in our Spadone
Concentrator Belts. Belts made to fit any machine—
4 and 6 feet wide. Prices and samples on ap-
plication.

AMALGAM PLATE CLEANERS.

Our AMALGAM Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner
which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly.
They are made 4 inches and 6 inches wide and 1/4 inch thick, making a convenient size to handle.
Packed by mail at any address, upon 7 cents. Correspondence solicited.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 850,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

THE BRETHERTON HOT BLAST.

APPARATUS FOR PYRITIC SMELTING. It saves fuel, increases capacity of furnace, improves character of work, does not require a hot top causing volatilization like other inventions; furnishes pure air heated without cost, can be attached to furnaces already in use, is an all-around money saver, built and used by practical, successful metallurgists. Write for particulars to

ASSESSMENT NOTICES.

MOHICAN MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1901, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 300 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 14th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. CLASSEN, Secretary.

Office—300 California St., San Francisco, California.

TUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of May, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 301, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of July, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office—Room 301, Claus Spreckels Building, San Francisco, California.

DELINQUENT SALE NOTICE.

SOUTH SLIGER GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 25th day of March, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Reservoir Dam Construction by Hydraulicking.

On this page is illustrated a reservoir dam constructed by the East Highlands Orange Co. in San Bernardino county, California. The dam is made of earth 65 feet high and 200 feet long by 40 feet wide on top. The construction was made by what is described as the hydraulic method, a novel engineering application of water developed in California placer mining.

In the kind of placer mining described as hydraulic mining, a large stream of water issuing in a jet under pressure made in a pipe line is thrown on a bank of gold-bearing earth or gravel, tearing it down and disintegrating it. The water then flowing away down hill, either in a natural channel or a specially devised box construction called a sluice box, is given such a grade that it carries with it the disintegrated earth and gravel, leaving behind obstructions on the bottom of the channel the gold that may be contained. No concern is taken of the earth or gravel carried away by the water, except to see that its accumulation does not destroy the carrying grade in the sluices and prevent a continuation of the mining.

In building a dam by the hydraulic method the matter of concern is to control the distribution of the earth and gravel, preventing its washing away, and effecting accumulation in a desired place. The carrying power of a stream increases rapidly with the grade. In practice the grade of the carrying sluice is made steeper than for gold washing, and the piping of the stream against the bank or, better yet, in the driving before it of the earth and gravel, the aim is to load the stream with all the material that it will carry—to “slum” the dirt, as the miners would say. The sluice boxes are so laid as to distribute the dam-building material over the base and to build from the center line of the completed structure. It is usual to plan both face slopes on lighter angles than

Dam Built by the Hydraulic Method in San Bernardino County, Cal.

Opening the 500-Foot Level Keystone Mine, Amador, Cal.

when the material is distributed dry, and to provide for a width of finished top somewhat greater. There is rarely any difficulty in making the water slope on the desired angle. The water accumulates in a pool behind the rising dam and tends to compact it and to force the accumulation. On the outside the sluice is arranged to carry the least possible proportion of water, so as to reduce the tendency to slip downward and flatten as it grows higher. In the dam illustrated, a brush dam 20 feet thick was employed, but the earth used was fine and light, containing no gravel, and did not separate well from the water when the stream was spread and its velocity slackened. Frequently the dam-building material is so situated that the hydraulic stream is employed directly to drive it into place in the dam. In construction, instead of the clay puddle wall in the center a wall of sheet piling is employed, or it can be omitted. The trunk outlet should go through a tunnel to one side of the dam. An earth dam constructed by this method is tighter and more substantial than when constructed dry. The settling and compacting is done simultaneously with its building. Voids and seams are all but impossible. In cost it is most certainly a cheaper construction. In specially favorable circumstances the material has been excavated and put in place as low as 10 cents a cubic yard.

Another novel application of this hydraulic method of earth-work construction is in building railroad fills in mountain country where the streams have rapid falls. The plant, consisting of a string of pipe, a “giant” and sluice boxes, is a portable property. Neither ditch nor road construction is required.

Opening a Mine Level.

The illustration on this page of a level opening is typical of the change in mine practice made during the last few years, lightening the labor of miners. The cut is from a photograph of a Rand drill at work in the 500-foot level of the Keystone mine at Amador, Cal.

THE use of a real war over possession of a mine is not going to be overlooked when it comes to advertising the mine. The smoke of battle is hardly off of the asphalt mines in Venezuela before an American in Mexico is reported as arming his mine workmen to drive off invaders.

THE report of the Master of Chancery to the U. S. Circuit Court in Chicago finding that electrolysis of water pipes had resulted from the leakage of trolley currents of electricity returned through the rails, and that the owner of the water pipes had good grounds for damages and recommending an injunction issue as asked, besides being good law, will, by forcing the installation of return wires for the current on all trolley lines, create a demand for copper that will tend to maintain prices for some time to come.

THE State Mining Bureau of California has announced the republication shortly of Bulletins Nos. 2, 5, 6, 9 and others on mine timbering, cyanide process, gold mill practices in California and mine drainages and pumps. It will be a graceful and appreciated act on the part of the writers to assist the bureau in giving these republications an added value to the mining industry by revising and bringing their excellent papers down to date. Much has been learned in practice since they were first published, particularly in the cyanide process.

THE United Verde mine, at Jerome, Yavapai county, Ariz., is to be assessed as having a value of \$6,000,000, making an annual tax of \$240,000. The assessment under the old law was \$600,000, tax \$24,000. The value of the mine, based on its income-earning power, has been rated at not less than \$50,000,000. At this cash sale basis, the assessed valuation of \$6,000,000 will be only 12% of the actual valuation, and the old assessment was only 1.2% of the cash sale value. Most mines are hardly so fortunate, and it is safe to say that other property in Yavapai county has never been assessed at so low a percentage of actual cash value. It would seem, however, that such a large increase in assessment valuation should lower the tax rate far below the 4% which seems to be the tax rate on the old valuation. There is no more aggregate of tax to be paid than before, while there is a larger assessment to pay it. The effect of the higher assessment will then be an equalization of the taxes. The mine will pay more others less.

A Home for Old Prospectors.

On another page appears a communication from N. E. Linsley of Spokane, Wash., in which he presents with much force reasons why the old prospector, to whom the mining industry of the West is so largely indebted for its basis—the discovery of the mineral deposits—should have a home for his old age, from which failure to find fortune for himself should not debar him. The communication tells its own purpose better than comment on it can. The old prospectors are a class, from the necessities of their occupation, largely apart from the mining industry that follows their trails and builds up society on their mineral finds. Not all who, in the half century that has just gone by, have gone out into the wilderness in search of mines have found them for themselves. The vast majority have not. Those who have are no longer prospectors, but have become part of the society the wealth of mineral they have found has brought into being.

The nature of the prospector's occupation, its wandering character, its hardships, isolation, uncertainty of reward, have resulted in preventing the formation of those natural family ties which build homes and provide the place of refuge for old age. On the other hand, the cumulating years have destroyed or severed the life ties that the prospector had when he started out.

In their relation to the mining industry the prospectors are the advance guard—soldiers of fortune. As a nation we are caring for the declining years of the old soldiers who fought the battles forty years ago that, preserving our nationality then, have made possible what it is now. In doing so our people do not question the motives of those men then, the personal inspiration of their action in fighting. They know only that those men did fight, and now that they are old and fortuneless—it matters not why—and so the nation cares for them and has built and maintains many homes for them. It would seem as if the mining industry could spare from its abundance a home for its battered soldiers of fortune—the old prospectors. Many States have been built where they first marched and then invited thrift to follow. Many great individual fortunes have been built up by following in their steps. True, it is the prospectors who have not been successful that the proposed giving is for; but why not? Certainly they are the ones who need what is proposed to be given. Every army has a rank and file, and survivors are not all officers.

The principles of the suggestion made by Mr. Linsley this paper approves. It would like to see it taken up and seriously considered with a view to such action in the matter of details as discussion will indicate as best to meet the conditions. The suggestion Mr. Linsley makes as to a site for the home at Coloma, where Marshall discovered gold in California, is exceedingly felicitous. The surrounding of river and hill, dead piles of gravel from which the gold was washed out a half century ago, forsaken tunnels leading into ledges on the slopes, vines and fig trees, the old buildings of '49, roofless, but with the office signboards of the old days of gold still bright and fresh in the marvelous sunshine, the stage coaches that pass through it, make the spot ideal for the purpose suggested.

MINING to great depths in California and in similar vein deposits is an entirely different problem from such deep mining as is proposed on the Rand in South Africa. First, the character of the ore deposits is entirely different. The Transvaal lodes are mechanically-made sedimentary beds, the place of secondary deposit and concentration of gold originally in veins similar to the California veins. The result of the mechanical formation is a uniformity of deposit, the existence and gold content of which can be estimated on with absolute certainty in advance of providing the means for mining it. In true veins bearing gold, as the quartz veins of California, there is no certainty of values very far in advance of the mining openings at any time. Experience has shown their unevenness of gold content so conclusively that it is not commercially possible to plan works as far in advance as in the case of the Transvaal conglomerates. Again, the heat limitation is more certain to restrict operation close to the surface with the gold quartz veins. A third reason is the problem of handling

water. In the Transvaal the quantity is small. In California quartz veins it is comparatively large and increases with depth. The veins are natural rock water channels, and additions to the flow as depth increases cannot be estimated on in advance. In conclusion, while deep mining in the Transvaal is a very reasonable proposition, because the profit and technical details can be estimated in advance, deep mining on the same scale in California or the Rocky mountains is not reasonable, because profit and technical details cannot be estimated on in advance. The best that is possible is to do just as California and Colorado miners are doing—take additions to depth a hundred feet at a time and be prepared to quit at any stage of advance.

THE American Smelting and Refining Co. has made another forward step in what this paper has pointed out was the inevitable effect of operation of the combination. The custom reduction mills and sampling works of Colorado have largely come under the business control, if not actual ownership, of the smelting corporation. The statement is made that the mill plants not yet absorbed will be, if wanted, as a consequence of the control of all the facilities of transportation held by the same people who control the smelting corporation. The industrial change is just announced. It is intended to effect economy as the smelting and transportation control view it. It is very probable that low grade ores will not have mill treatment or freight charges increased. To do so would reduce tonnage, which is what the smelters and transportation want. But a readjustment will be effected and the higher grade ores will be made to carry higher charges. The mine operator can refuse to mine or sell the ores, but that matters nothing to the combination, as it does not reduce tonnage to any amount that could cut smelter or transportation profits. The mine operator can refuse to mine and sell his high-grade ores, but very probably will not. The additions to the charges cut down his profit margin, but they do not wipe it out. The reduction in the profit margin reduces the capital value of his mine, but does not destroy it entirely. The mine operator, if a leaser, is able to pass the reduction in profit back to the owner by a diminished tonnage royalty payment. Readjustment of treatment and freight charges, as proposed to these people who own the best mines, is exactly the same as confiscation, without compensation, of a portion of their mines. There is not to justify it even the fiction of the service rendered costing more for high-grade ores than it does for low-grade ores. As a matter of fact it costs absolutely less per ounce of gold or silver produced, per ton of copper or lead produced, with high-grade ores than with low-grade ores. The readjustment coincident on the restriction of free contract on the part of the mine owner is thus in fact a confiscation. It is equally business and economy—from the smelter combination end of it. It is not the end of the action resulting inevitably from the combination, but it is a step forward towards it. The mine owners if they would meet this business of the smelting combination, which is confiscation to them, must take action on the same lines as the action against them is taken. They must associate as the beginning of action. Using the power that association gives they have then an advantage. It is easier for the mines to get new railroads and new reduction works than it is for the smelters and the railroads to get new mines.

THE great increase in the use of platinum, coupled with the fact that the production is stationary, or decreasing, is raising the price of the metal rapidly. It is now much more valuable than gold. British Columbia and California can both increase their production if the miners will undertake to save the small amounts recovered with placer gold. In British Columbia, in the Caribou district, the amount of platinum caught with the gold is quite considerable, and it certainly should not cost to save in parting from the gold at the mines but a fraction of what it now sells for. In the Klamath region of California the proportion with the gold is less, and miners say it has not paid to save when parting. Possibly that may have been the case when it was only worth \$5 or \$6 an ounce crude, but the value has appreciated so much now that the business of saving it seems commercially justified.

Concentrates.

A DISCOVERY of a diamond field is reported in New Zealand.

THE railroads have made a rate of one fare, plus \$2, for transportation to the International Mining Congress at Boise, Idaho, meeting July 23, 24, 25.

MALTA is the name by which are known natural hydrocarbons of the petroleum series that are between solids and liquids. The consistency is about that of tar.

The mineral specimen from the gravel diggings of Sierra county, Cal., is not bort or black diamond. It is pello-melane (hydrous manganese manganate). The hardness of the particular specimen is exceptional. Text-books give the hardness as 5-6.

FOR hastening the settlement of concentrates from a vanner belt in the box beneath the table a hammer automatically striking rapid blows on the side of the box is employed. This is used in the large Alaska mills and is there called the "Alaska kicker."

BENZENE is a mixture of hydrocarbons, the lighter oils distilling over first from petroleum, and commercially known as gasoline. Benzene is the hydrocarbon (C_6H_6) obtained in the distillation of coal tar. Despite the close spelling they are chemically and commercially different oils.

A GROUP of fifty mining claims is not necessarily a mine. More often than otherwise it is not. One deposit of payable ore on one claim will make a mine without the other forty-nine claims. Chances of having a mine are not materially increased by having a large number of claims.

WORK done on one claim in an adit which, if continued, would enter and develop a group of contiguous claims, is assessment work within the meaning of the law and interpretations which the courts have given it. For five claims it is necessary that the work done should amount to at least \$500.

THE California State Mining Bureau does not make assays or quantitative determinations of the composition of mineral specimens. It will, on request, make mineralogical determinations of samples received from the State of California. Samples or minerals sent from outside of the State will not be determined.

A SUBSTITUTE for the steel cable in haulage of cars in long flat inclines has been proposed. A double rack is to be fitted to the sides of the shaft in which cogged wheels of a small carriage engage. The wheels are driven by an electric motor fed by a wire. The idea is to save the expense of lifting the heavy weight of cable.

A PENEPLAIN is a word used by geologists to indicate a region of light relief as to topography, the fixed result of denudation on a region of originally considerable topographical relief. It is generally used as the equivalent of a base level plain, one from the surface of which there can be no more erosion by the existing eroding agencies.

IN application for patent to groups of mining claims, where the work is all done on one, it is not necessary that the group should be embraced in one application. One or more can be patented in one application, and the remainder, one at a time or grouped, can be subsequently patented on their proportion of the original work that was done for the group.

DISCOVERIES of molybdenite are being reported from many localities. It is probable that very few are of sufficiently high grade to be commercially utilizable. The demand is not, however, so large but that an increase in supplies may lower sale prices without increasing consumption. It is a business condition that should be considered in estimating the commercial value of such finds.

THE telescopic object glasses used in surveying instruments are many of them what are termed eccentric. The instrument cannot be so adjusted that the intersection of the crosshairs will cut points in straight lines both horizontally and vertically. The difficulty is got around by so placing the glass in a transit instrument that all the error is in the horizontal line, and in a level instrument it is all in the vertical line.

ON the right to take timber from public lands for mining use there have been several interpretations made, the lines growing narrower as abuses have developed. The latest decision is by an Oregon court, which limits the cutting of timber on a claim to use on that claim alone. Where a group is being developed by one tunnel, it would seem that timber can be taken from claims the tunnel work is not on, but for which it is intended.

A CHEMIST writes us that he has used zinc shavings, such as are used in the precipitation boxes of the cyanide process, for the reduction of solutions of ferric-chloride previous to estimating the iron volumetrically with many advantages over the use of granulated zinc or any of the other methods of reduction. A complete reduction of the ferric-chloride can be made in six minutes. The shavings must be tested for impurities and corrections applied to the iron determination accordingly.

THE gold-bearing blue gravel underneath sandstone, near Hornbrook, Siskiyou Co., Cal., is not precisely the same kind of a deposit as the blue gravel under the lava deposits in the Sierra Nevada mountains. The former, though probably land-formed, subsequently became submerged beneath the sea, and covered with sand, which

was ultimately compacted into rock. The blue gravel in the Sierra Nevada mountains has not been beneath the sea since its formation in place. It became buried beneath rock by the hardening on the land surface of the volcanic muds and lava.

THE use of perfectly dry steam and the elimination of condensed water would seem a very practical advantage of superheating. Water is a disturbing element in steam engines and steam pipes at all times. It increases the friction of the wearing surface, interferes with the lubrication, and chokes up the discharge; it produces unequal strains in the metal, due to different temperatures, and often gives leaks at joints which remain perfectly tight under dry steam.

THE following are recognized methods of distribution for electric light or power or both: Two-wire and three-wire systems for direct or alternating currents; multi-circuit system for direct current multi-voltage system; single-phase, two-wire alternating current; two-phase, three or four-wire alternating current; three-phase, three or four-wire alternating current; composite system, direct current and single-phase or two-phase alternating current on same wires.

A PROSPECTOR is greatly assisted in his work by a knowledge of geology; not an expert's knowledge, or a knowledge of the names of rocks based on microscopic examination, but a knowledge of dynamical and structural geology so as to understand and apply it in connection with discoveries of ore deposits. The idea is to have sufficient knowledge to reason the facts of mineral occurrence as they come to a man in new ground looking for value in such deposits. The geological knowledge is a time saving tool.

POSSESSION of a mining claim in British Columbia, among other things, requires the possession of a free miner's license by the owner. If this lapses, the mine is forfeited. A form of relief is provided by a law of the last Legislature, which gives six months' time in which the owner by paying \$15 may obtain a revival of his rights of ownership and a free miner's license. Where ownership is in a joint stock company the fee is \$300. Under the new law all miner's licenses expire at midnight on May 31st of each year.

THE clearance in the cylinders of air compressors varies from one-fifth of 1% to 2% of the total piston displacement. The loss of capacity due to clearance varies with the pressure against which the piston is working. If the clearances are 1% of the volume of the cylinder and the pressure is six atmospheres, the loss of capacity due to clearance is 6%. If the pressure is ten atmospheres, the loss is 10%. If the inlet valve is set so as to open when the clearance air has expanded to atmospheric pressure, the only loss is the clearance space. If the valve opens at the extreme point, the air in the clearance exhausts through the intake and there is a loss of power as well as of capacity. The inlet valve should be adjusted to correspond with changes made in the pressure.

COAL OR PETROLEUM prospecting licenses in British Columbia are obtained by application to the Gold Commissioner in writing, in duplicate, accompanied by plans of the land and a fee of \$50. A thirty days' notice has to be posted on the land and published in the official gazette and local newspaper for the same time. Not more than 640 acres square, and with north and south and east and west lines, is allowed. The license is issued for one year and extensions are granted for two years more. On proof of discovery of coal the land may be leased for five years at 10 cents an acre and 5 cents royalty per ton of coal or 1 cent a barrel of petroleum. Within three months of the expiration of the lease, on proof of continuous working the lessee may purchase the land at \$5 an acre.

THE term paying so much per unit, employed in transactions with custom smelters, means payment so much for each 1% of the net metal or mineral after the smelter deductions for errors in assay or estimated unavoidable losses. For example: the new contracts offered miners by the American Smelting & Refining Co. offers payment for 90% of the lead in the ore as shown by assay. An ore, then, assaying 54% in lead, would for sale be the same to the seller as if it only contained 48.6%, and thus would be, in smelter language, 48.6 units. Copper in ores is subject to a deduction usually of 1.3%, or 1.3 units. So, if an assay showed 14% copper, the smelter would pay for 12.7 units. With some minerals there is no deduction made by buyers. The term unit originated in English metallurgy, but in the United States is being rapidly displaced by per cent.

TITANIFEROUS IRON ORES have been smelted and pig iron made. At the blast furnace temperature the titanium oxide is not reduced by carbon, but some of the titanium in very small proportions, .10 to .30 of 1%, or more, often only traces, alloys with the smelted iron. The pig iron containing this titanium is of extra quality, what is known as a forge iron, desirable for making steel by the open hearth process. The iron is very strong and has a close-grained fracture, resembling steel. The effect of the titanium in the metal is similar to that of nickel in hardening and toughening. The titaniferous ores, associated with magnetite and more or less with gold and silver-bearing pyrite and chalcocopyrite, are quite abundant on Prince of Wales Island in Alaska. The situation is close to tide water and the conditions for cheap mining are more favorable than at the hard ore deposits of northern Michigan.

THERE is nothing improbable in the reported discoveries of a new "banket" gold reef area in South Africa, or, indeed, anywhere else. There is no reason to assume, in the first instance, that the Rand already discovered is the only possible one. Nature is not so selective geologically. It is possible for there to be a recurrence of the same conditions which originally formed the auriferous conglomerate beds of the Transvaal. It must be borne in mind, too, that such an area does not have to be a mineral-bearing area in the sense ordinarily understood. The gold-bearing conglomerate is simply an old coastal deposit, deriving its gold by water transportation, more or less land from districts, mineral in the ordinary sense. There are many localities containing known auriferous conglomerates, but very few in which the content is sufficiently large to make them mines. The newly discovered one still has that chance.

GEOLOGISTS have been gradually working out to the theory that the Glacial Period is divisible into two epochs. By this they mean that there was first a long period of glaciation, then a considerable time interval during which there was a recession of the glaciers northward and upward into the mountain summits, and finally a shorter period during which the glaciers again extended southward and downward, but for not as long a time interval as for the first epoch. Succeeding this last has come the present period. It is questionable if there were not many more divisions of condition in the Glacial Period. The glaciers of the southeastern Alaska coast during the last fifty years have been diminishing with great rapidity. Very many of them that within that period were known to discharge directly into the sea are now terminating back from the shore from 1 to 2 miles. Many of the smaller ones, farther inland, have withdrawn in clearly recent years far up toward the high summits.

VERY LITTLE of the so-called cheap labor in the Far East—in Siberia, China, Japan or the Philippine Islands—is really cheap labor. An exact statement of fact would be that day wages are low and hours of labor long. The labor is not efficient, however, and, except as to Chinese and Japanese, not particularly teachable. The Siberians have many holidays, which they insist on observing. They prefer their imperfect tools and time-wasteful methods to the better tool and time-saving methods. Philippines are much the same, but as the labor in that country is on agricultural production, the gathering of crops, the proportion of the sale value of the total created by labor is less than with mining, and its effect is not so commercially evident. Japanese are physically small, though exceedingly apt and responsive to instruction. The Koreans, physically larger and stronger men, command higher wages in Japan coal mines, as a result of their greater physical strength. The Chinese, considered from any point of view, are by far the best class of Asiatic laborers. They are fairly teachable and physically strong. They have no prejudices against hand tools of improved construction. Their vice is petty theft. It has been found hard to keep them from stealing parts of machinery, nails, screws, tools and trifling things of no great money cost but important to the economy of working at points so far distant from the base of supply. It would seem as if the contract system of work with native contractors and a holding of the contractors to strict accountability for theft losses would in the end prove the only effective method of doing industrial works of magnitude, particularly mining, in China.

THE practice of smelters in returning assays of sulphide copper ores carrying gold and silver is not uniform. What is returned is a partial analysis. Copper is given to the nearest tenth of a per cent; gold and silver in ounces per ton, iron and silica (SiO_2) to the nearest per cent, occasionally the former to the nearest tenth of a per cent. Sulphur, lime, aluminum, oxygen are not determined. Water is returned, but not as a constituent of the mineral. There must be some error in a return of assay which gives 5.3% copper, 24% iron, 52% silica, and .16 oz. gold, 4.2 oz. silver, the mineral assayed being a sulphide ore containing only chalcocopyrite ($CuFeS_2$), pyrite (FeS_2) and quartz (SiO_2) with no iron oxides or copper carbonates at all. Magnetic oxide of iron, magnetite, could be easily recognized with a magnet in pulverized mineral. The percentages of copper and iron being given the rough check for error would be an independent direct determination of the sulphur by chemical analysis, or a preliminary test can be made approximately determining it mathematically. The sulphide mineral is a mixture of chalcocopyrite and pyrite, the copper only existing in the chalcocopyrite form. The percentage composition of chalcocopyrite is copper 34.5%, iron 30.5% and sulphur 35.0%. With 5.2% of copper in the ore all in chalcocopyrite the iron and sulphur of the chalcocopyrite are determined by simple proportion: 34.5 copper : 30.5 iron :: 5.2 copper : (iron 4.6) and 34.5 copper : 35 sulphur :: 5.2 copper : (sulphur 5.3). Deducting 4.6% iron from 24%, the remainder 19.4% is the iron in the pyrite. The percentage composition of pyrite is iron 46.6% and sulphur 53.4%. Determining now the sulphur in the pyrite in the ore by the proportion, 46.6 iron :: 19.4 iron :: 53.4 sulphur : (sulphur 22.2). The sulphur in the mineral is then 4.6% in the chalcocopyrite plus 22.2% in the pyrite, 26.8%. And the trial proximate analysis would then be the sum of 5.2% copper, 24% iron, 52% silica, and 26.8% sulphur, or 108%, which, being impossible, clearly indicates the probability of error in the partial analysis from which it is estimated.

A Home for Prospectors.

TO THE EDITOR:—Of all the great events of the nineteenth century, none are paramount to the discovery of gold in California in 1848. We were then a rather slow-going nation, with practically no capital to exploit and properly develop the country east of the Mississippi, to say nothing of the vast unknown country extending from St. Louis to Astoria, and from British Columbia to Old Mexico.

When gold was discovered in California in 1848, it took but a short time to proclaim the good news to all the civilized world, and less than fifteen months after the discovery parties of men from nearly all parts of the world were en route to the new Eldorado.

The news had aroused the latent force in man that enables him to overcome all obstacles—conquer the wild animals, subdue the Indians, build villages and school houses, and then look for other worlds to conquer.

They were a fine lot of men, physically and mentally, that started for California in 1849-50, and those who crossed the plains never recovered from that love of adventure and desire to see and explore, that they acquired on the trip.

After the year 1850 the States began to feel the effect of all the new dollars put into circulation, and our growth from that time on has been a marvel. A little gold was being mined in Georgia, but it was California first and the Rocky Mountain region later, that furnished the sinews of war, commerce and manufacture that made it possible for us to become the foremost nation of the world within the short period of fifty years. It is to the men who pioneered the great West that I desire to call your attention. What shall we do for them?

It seems to me that many of these men were created to blaze trails, make discoveries, and endure hardships, so that those who followed could enjoy all the comforts of advanced civilization. Many of these men have gone to the great unknown, and need no assistance from us. But there are many still living, who are from fifty to seventy years old, still prospecting and exploring. How they live would be a revelation to many who have become wealthy through the efforts, endurance and sufferings of these same pioneers and prospectors. With a saddle horse, a pack horse to carry from three to four months' provision, which consists of flour, bacon, beans, coffee, tea, sugar and salt for himself and his horses, a pick and shovel and a few cooking utensils—he nearly always uses tobacco, and sometimes has a dog for a companion—with \$25 in his pocket and a few blankets to keep him warm at night, the prospector is equipped for a six months' trip into the mountains. He is full of hope—optimistic and visionary to the extreme. He starts out in the springtime feeling sure that he will strike it rich and make a stake before snow flies.

He leaves the roads and trails and strikes out for the unexplored country, examines closely every change in the formation, and, with his pole-pick handy, he breaks and examines everything that looks like ore, pans out the gravel along the creek beds for gold colors, endures all kinds of hardships, and 90% of these full season trips bring him nothing that will justify further exploitation.

Sometimes he strikes it rich and reports the fact to his fellow prospectors and a stampede is the result.

Washoe, Nevada, Virginia City, Montana, and a hundred other places that have produced a billion of new dollars, is the result of the indomitable and tireless search of the prospector. Sometimes the prospector gets a snug little fortune and retires from the field. But the majority of them are improvident, lavish with their money until it is all gone, then get some one to stake them to an outfit and again go to the wilderness in search of another fortune.

The pioneer prospector has nearly filled his mission in the United States, civilization has encroached on his domain until he is obliged to travel on railroads, eat at restaurants and sleep in beds. This all costs too much money for the "old timer," whose habits are as fixed as the very hills which have so many years been his domain. There will be plenty of prospecting to do for the next fifty years in the Rocky Mountain country, but it will be so different—the new prospector will need no packhorse.

But I am digressing; it is the old pioneer prospector that prompts this effort. He is now too old and feeble to continue in the fields. He has lived so long in the mountains with the trees, rocks, and wild animals for his friends and companions, that he feels unhappy and uncomfortable in the city, and much more so if he is "broke." He is unfitted for work on a farm or for sawing wood at the back door for a livelihood. He who has lived so close to nature so long, where the results of his efforts have been of such vast benefit to all of the North American continent, should not be asked to do menial service after he has given all the best part of his life in pioneering and prospecting the unexplored. What shall we do for him?

I would suggest a "Pioneer Prospectors' Home," located some place in California, not far from the place where gold was first discovered. Possibly the

old ranch where gold was first discovered might be the very place to choose. However, this could be determined later by a committee to investigate and locate. I would suggest: First, a suitable location containing not less than 2000 acres of land, at least one-half of which would be well adapted to diversified farming, gardening and fruit growing, the other half to grazing.

Second, a comfortable building, or buildings, capable of comfortably accommodating 300 people, and a well-equipped hospital, good farm buildings, utensils, etc., suitable to properly farm, garden and dairy the entire 2000 acres.

How to raise funds to carry out the scheme would be the first and important step. I would suggest that contributions to the amount of \$500,000 be solicited from wealthy mine owners, and others who have become wealthy directly and indirectly from the source of mines. Then ask the Federal Government for \$500,000, and the Rocky Mountain and Pacific States each \$20,000. Then an annual appropriation of \$100,000 from the Federal Government. It appears to the writer that this should not be a difficult task or an unreasonable amount to ask for this worthy cause.

The 2000 acres properly managed should furnish all the vegetables, butter and milk, most of the fruit required, and a fair percentage of the meat and eggs. Those occupying the home, and able to do so, should be given some light duty to perform. Not compelled, the old prospector will volunteer and become interested, if treated right. I served three years in the army during the war of the Rebellion, and I have spent thirty-four years at mining in the Rocky mountains and Pacific States. The soldier who served his country in the army is no more entitled to a pension and governmental aid than these same pioneer prospectors who have spent all of the best part of their lives blazing trails and showing up the great mineral wealth of the nation.

Eligibility to the benefits of the Home could be determined through statistics, etc. A regent from each of the Rocky Mountain and Pacific States appointed to govern the Home could arrange that matter after due consideration. My opinion is that the applicant should first show that he had been a prospector for at least twenty years and was now unable to continue in the field.

When the Home is completed and ready for the prospector, let him come, not as a mendicant, but as an honored guest, and there, in his declining years, he will live in the past. In the wreaths of smoke from his pipe he will again see the stampede of excited prospectors and miners hurrying to some reported rich find. Again he will climb to the top of the highest mountain peak and feel sorry for the millions of people who have lived and died and never had one breath of fresh air like this. He will again be mending his shoes by his campfire and the pine squirrel will talk to him from the branches above. The waterfall, the beautiful lakes, the deep forest and rolling hills will all pass in review. Nature has kindly provided that the dark spots in his memory gradually disappear, leaving the bright ones brighter as he grows older. He has nearly outlived his usefulness, but he is entitled to a comfortable home far removed from the bill collector. Let him smoke his pipe and live over again those days of full vigor and manhood!

N. E. LINSLEY, M. E.

Spokane, May 13.

Tamping Dynamite Blasting Holes.

TO THE EDITOR:—I have been very much interested in several articles which have recently appeared in regard to tamping giant powder in blasting rock. Now I know some miners will say the holes break just as well without tamping as with it; but, after saying that tamping in the case of giant powder does not mean a hole driven full of shavings with a mallet, as in the case of black powder, but only means a hole full of water or soft mud—in fact, anything which will make a tight joint and increase the resistance of the mouth or collar of the hole. I will illustrate by a case in which tamping proved very necessary:

When the U. S. Government sold the old cast iron cannon at Fort Point, San Francisco, to replace them with modern steel rifles, they were bought by foundrymen to be melted up and recast into other articles. They found that, however, being made of the best cast iron, they were quite difficult to reduce to a size that would go into a furnace.

Now comes the man with the tamping; he fastens a few pounds of giant powder on a stick, lets the cannon down into a hole in the ground lined with others like it, pours the cannon full of water, puts his powder inside the cannon, explodes it and finds the cannon in pieces that two men can handle.

Now, I do not say that more powder, without the water tamping, may not have broken the cannon the same way, but this shows the increased rending effect when tamping other than air is used.

C. P. G.
Stent, Cal., May 26.

GERMAN PAPERS report that H. Houbon, an Englishman, has discovered a process for making pure hydrogen from acetylene. He compresses acetylene in a Caillet steel bomb up to five atmospheres and ignites it with electricity. The acetylene decomposes

into hydrogen and carbon, the latter precipitating in a fine soot. The process, it is claimed, is without danger, and it is possible to manufacture hydrogen on a large scale very much more cheaply than by present methods.

Salt Lake County, Utah.

[STAFF CORRESPONDENCE.]

A standard gauge railroad, operated by the Copper Belt R. R. Co., now extends from the Rio Grande Western terminus, in lower Bingham, up Bingham canyon to the mines of the Bingham Copper & Gold Co. The line is about 4 miles in length and will doubtless be extended up Highland gulch to the old Jordan & Galena of the U. S. group. At the upper terminus are the ore bins of the Bingham C. & G. Co., which receive the ores by gravity tram cars from the main tunnel. Self-dumping ore cars receive the ore from the bins through chutes, conveying it to the company's smelter in the Jordan valley. The Bingham C. & G. mine is one of the various properties which are under the general direction of Duncan McVichie.

The holdings cover an ore zone which runs nearly east and west, with numerous cross veins. The main ore body stands at a considerable inclination from the vertical. It is opened by a series of drifts or levels along the vein at irregular vertical distances apart, all being connected by chutes and inclines. The top level connects with a tunnel that passes to the surface on the Highland gulch side; the lower level connects with the main ore delivery tunnel, which passes to the surface on the opposite side of the mountain that overlooks Bingham canyon. From the top level to the lower level is a depth of about 500 feet on the dip of the vein. At a point nearly half way between the lower and upper is what they designate as the seventh level, from which a very large tonnage of ore passes through chutes down to the lower or shipping level. This seventh extends several hundred feet along the strike of the ore body and has a large amount of trackage to the chutes and inclines. The intermediate workings are in the nature of sub-levels or drifts which follow the irregular formation of the ore shoots. The latter stand vertically in places, horizontally in others, widening out into great bunches frequently, as shown by worked-out chambers. The method of mining here is the caving system, thus avoiding the use of so much timber as is required by square sets or stulls that follow the usual method of stoping.

The original workings on this property were on the top level, where the ore was considerably oxidized, which condition extends down 100 feet or so below the upper, where there was considerable lead as well as copper. From that level down to the shipping tunnel, however, the ores are a copper and iron sulphide, bearing a varying proportion of copper and iron. In certain shoots the ores are very siliceous, running high in copper and low in iron; in others the order is reversed, in which the iron predominates over the copper, with very little silica, but carrying good values in gold and silver. The workings generally show that on getting below the oxidized belt the lead values largely disappear.

The U. S. group, whose holdings embrace half a mile wide by 2 miles in length, extend over both sides of Highland gulch, including the old Jordan & Galena and the old Telegraph groups. The plants on these two main groups form the basis of two sets of operations. This consolidation covers a great lime belt, 150 to 350 feet wide, standing between two quartzite walls. This lime belt dips to the northeast about 30° and carries a series of ore shoots, some of them parallel and others crosswise with it. The earlier stages of mining on these properties, extending from the '70s to the early '90s, were confined to the surface ore shoots, practically above the 200-foot level, the product being carbonate ores, bearing high values in lead and silver, the output in that period amounting to nearly \$30,000,000. But now the proposition is one of mining at greater depth and opening the shoots of ore that carry an iron and copper sulphide, whose values in the main are copper, silver and gold. This belt or zone lies below the Bingham C. & G. body. It appears that the foot wall of the latter forms the hanging wall of the U. S. ore body. During the past year the work on the U. S. has been confined to development work, and it is stated by Supt. Mayberry that 14,000 feet of such work has been done in that time, opening up new ore bodies which are said to measure 300,000 tons, and that there is now in sight, as demonstrated by measurements, sampling and assays, over 1,000,000 tons of ore. All this new work has been opened through inclines and tunnels. A force of seventy men are kept employed. When the work of producing begins the caving system will be adopted.

It is stated that plans for a smelting plant in the Jordan valley are being made. The business relations of the U. S. Co. and the Centennial-Eureka, in Tintic district, are very close, by reason of many of the stockholders in both companies being identical, and the matter of providing smelting facilities for both properties is being considered jointly.

Bingham Canyon, May 18.

Forest Endowment of Pacific Slope.

By PROF. J. G. LEMMON.

Mother Nature is wonderfully lavish with her favors towards some countries, and as strangely niggardly to others. No more striking proof of this fact is found than that of the distribution of the forests over the land surface of the earth. It is but little understood that the most wonderful and valuable forest known is that of Northwest America.

This forest possesses more kinds or species of resinous-wooded, needle-leaved, cone-bearing trees than any equal area in the world, and these trees are either the largest in dimensions or they bear the largest fruits, called cones, that the earth has produced.

This matchless combination of superlative qualities has been bestowed by circumstances and forces so wonderful as to give the phenomenon the character of a distinct gift or local endowment.

Passing by the non-resinous, broad-leaved trees, of which there is a liberal allowance, the resinous-wooded, cone-bearing trees of the Pacific slope number fourteen genera or families, comprising seventy species or all kinds of trees—thirteen of the genera with forty species being in California.

Of these species twenty-seven are pines, two are larches, five are spruces, two are hemlock spruces, two are false hemlock spruces, ten are firs, two are redwoods, two are American cedars, seven are cypresses, nine are junipers and two are yews.

ENORMOUS SIZE OF TREES AND CONES.—Three of our pines—the great sugar, the yellow and the Jeffrey pine, all of them being very valuable trees, are also the largest trees of the family, often attaining a height of 220 feet, with a diameter of 10-12 feet—no pines of foreign countries attain one-half of these dimensions.

Five of our pines bear longer or heavier cones, with larger seeds than any found elsewhere, the cones of the very valuable sugar pine being 15-20 inches long, while those of the Coulter pine often weigh 8-10 pounds, the gray pine 3-4 pounds, the Torrey pine 2 pounds and the Jeffrey pine 1½-2 pounds, while the largest cones outside of California scarcely exceed 6 inches and the heaviest rarely weigh 1 pound.

Two of our spruces attain enormous dimensions—the very beautiful and valuable Douglas spruce of the Sierra and northward becomes 300-450 feet high, with a trunk 8-12 feet thick. The great Tideland spruce of the north coast is but little less in dimensions, while the cone of the Big-cone hemlock spruce of the San Bernardino mountains is 5-7 inches long and 3-4 inches thick when ripe and expanded—these dimensions far exceeding any foreign spruce.

Five of our firs, the red bark, the white bark, and the Shasta firs of California, and the grand and noble fir of the region northward, become two or three times as large as any Eastern or foreign fir, being often 200-300 feet high, 12-18 feet in diameter, with cones 6-8 inches long.

Our two world-renowned redwoods—the coast redwood and the Sierra big trees, rising to the height of 300-320 feet and enlarging, while yet young, to a diameter of 20-35 feet, and growing for 3000-5000 years—are not approached in grand proportions and regal majesty elsewhere. And the cones of one of our redwoods—the Sierra big tree—though small as compared with our pine cones, are yet, doubtless, the monsters of their race, the largest being the size of a hen's egg, while the largest cone found in connection with the fossil remains of the twenty-five extinct species do not exceed the size of a nutmeg.

So with the 2-3-inch cones of our Alpine hemlock spruce, the 1-inch cone of the incense cedar, the ½-inch cone of the Monterey cypress, the ¼-inch berry of the California juniper, and the California false nutmeg—all the largest cones of their respective families.

WHY THIS FAVORITISM?—This prodigality in number and size extends to other vegetable growths. Our oaks are numerous and often large, with the largest acorns and cups known. One of our maples bears leaves 6-10 inches across, while the little pop-gun elder of the East is supplanted here by a species 12-20 inches in diameter.

Most of the trees mentioned are indigenous to California and three-fourths of them are found only in that State. Why this great prodigality of nature in behalf of the Pacific slope, and especially of little California?

The solution of this problem involves a brief discussion of certain controlling factors.

At the outset we may observe that an impassable climatic barrier is set up at present by nature, preventing migration north and south. The torrid zone, in which no resinous trees can grow except on high peaks, separates the world's forests into unequal and very different floras.

The Southern Hemisphere is the home of the araucaria, the eucalyptus and the acacia, while in the Northern Hemisphere are found—in addition to the hosts of broad-leaved, non-resinous trees, such as oak, ash, hickory, etc.—all of the large families of pine, larch, cedar, spruce and fir, with the redwood, cypress and juniper; the distribution of these trees across the two continents, however, is very unequal.

DISPARITY OF AREAS AND DISTRIBUTION.—The northern part of the eastern continent—Eurasia—is, approximately, 9000 miles across. North America is but 3000. We would naturally expect, for instance, three times as many pines in Eurasia as in America. Of the eighty species of known pines, only twenty are indigenous to Eurasia, while sixty are flourishing in America.

Again, the Pacific slope region, from the Rocky mountains to the Pacific shore, is about 1000 miles—one-third of the distance across—yet it has forty out of the sixty American species, fifteen being in Mexico and twenty-five in the western United States, with twenty of these in California, a narrow strip of coast only 800 miles long by 150 wide, yet containing as many pines as all Eurasia!

Now, if the distribution was equal, Eurasia having sixty pines and North America twenty, the Pacific slope, being one-third of America, would be entitled to but 6⅔ species, and little California, which embraces about one-tenth of the Pacific slope, would have little more than half a chance to get one species!

This excessive prodigality of nature in favor of the Pacific slope, and especially the California part of it, is due to a combination of factors, chief of which are the contours of continents, the trend of principal mountain ranges, the behavior of certain oceanic and atmospheric currents, the alternate elevation and depression of continental areas, together with the ability of all these factors to modify the effects of certain crucial climatic periods, called—

THE ICE AGE AND THE THERMAL AGE.—The phenomenon of hot and cold periods in the earth's history compelling the migration, the change of location of the entire organic world—the kingdoms of the animals and plants—is a much discussed and controverted topic. Several theories have been presented from time to time, accounting for these important epochs, chief of which is the very interesting—

ASTRONOMICAL THEORY.—This theory, first presented by Mr. Croll, and endorsed by Prof. Geikie and many other English geologists, "attributes the Glacial age to the combined influence of precession of equinoxes and secular changes in the eccentricity of the earth's orbit," whereby the seasons, summer and winter, would have a disparity of nearly five weeks, instead of one week, as at present; this disparity, it is claimed, would produce Glacial and Thermal ages alternately every 21,000 years.

However, Prof. LeConte, America's most renowned geologist, controverts this theory in part, quoting from many authorities, showing that but one Glacial age can be proven. Referring to the researches of Prof. Wallace and others, he asserts that the phenomenon is the result of several agencies—astronomical, geological and geographical—producing a severe Glacial age of great length, with two cumulate periods of greatest severity and a sub-Thermal period between; the age commencing about 240,000 years ago, continuing 160,000 years and ending 80,000 years ago.

GREAT DESTRUCTION BY COLD.—During this Glacial age the plants were driven slowly, generation after generation, a few feet at a time, down across the north temperate zone, by the world-wide sheet of ice, to be as slowly driven back by waves of tropic heat.

In this double migration, owing to the configuration of continents and mountain ranges, most of the plants were destroyed, only a few vestiges of the post-Glacial families being extant to-day, gathered here and there upon the plains or stranded upon the mountains.

The means and manner of this destruction are most interesting. The continents of both the old and new world are greatly expanded at the north, while the southern portions are attenuated to narrow peninsulas.

These configurations give to the north temperate zone its greatly dominant character, having most of the existing families, while the peninsulas are sparsely furnished.

The Eurasian mountain ranges are mostly transverse, like the Alps, Himalayas and Thian-Chan mountains, forming barriers to the progress of plants; while North American ranges are nearly longitudinal, permitting the plants to escape southward during a Glacial age and return during a Thermal one.

There is much evidence found as fossils in the rock strata that an abundant flora of monster trees once occupied the Arctic regions, similar on the two continents, owing to connections then existing or to nearness of extremities.

MANNER OF THIS DESTRUCTION.—The formation of an ice cap at the pole and of snow and ice deposits on the summits of mountains lower down in latitude, drove the plants down from the northern plains and down from the mountain sides to form vast hordes of fugitives hastening to southern plains.

This hegira continuing as the sheet of ice grew and plowed its glacier beds slowly down to median latitudes of Europe and Asia, the entire members of many families were overtaken on the northern side of the mountain ranges and frozen out; others, passing between the ends of the ranges, reached the shores of the Mediterranean sea and the Indian ocean, and were then and there destroyed, a few only

escaping by the narrow, devious Isthmus of Suez into Africa, while others huddled upon the three peninsulas of Arabia, Hindustan and Malacca.

On the western continent a great portion of the plants in their flight came down unobstructed to the Gulf of Mexico, to be caught and frozen there; a few eastern families escaped on the peninsula of Florida, while the greater part of the western plants ran down along the plateau of Mexico into Central America and perhaps finally crossed on the Isthmus of Darien into South America.

(TO BE CONTINUED.)

Nevada's Exhibit at the Pan-American Exposition.

The State collections and specimens from museums have not been used in Nevada's exhibit, and no exhibit is shown that is not from a mine now in operation. A most advantageous opportunity is thus presented for investors and others interested in practical mining to familiarize themselves with the real mining resources of the Western State.

Nevada has 50 feet of space along the south wall of the mines building, the exhibit being attractively arranged in long mahogany cabinets 11 feet high. On the walls above the cabinets are pictures illustrating the underground timbering of the Comstock lode, and the Pamlico hill, showing the workings of the dump and other features connected with the mining work above ground.

On the right hand side of the exhibit is a complete quartz mill operated by electricity; a model of the underground timbering of the Comstock lode, and a model showing the underground workings of the Pamlico mine. Next is an exhibit of copper ores, showing every variety from native copper to the carbonates, from all over the State. Lead ores from solid galena to beautiful molybdate crystals are shown. Building stones, marble and onyx, including sky-blue marble, are presented. Silver ores, showing wire silver, ruby silver, horn silver, and black metal, bromide of silver, chloride of silver and stephenite are included.

A piece of discovery ore of the great Comstock lode, found on what is now known as the Ophir ground, is among the curiosities of the exhibit. Gold ores, from the wire gold of the Pamlico to the lower grade ores which predominate throughout the State, are to the left of the silver ores. Sulphur analyzing 99%, from the fields of Humboldt county, comes next. Iron ore of every sort, nickel and cobalt—the latter from Churchill county—are next in order.

Comstock ores from the surface to the 3250-foot level of the Con. California & Virginia mine are exhibited. Antimony and graphite are in the next group. Mica, rock salt, table salt, soda, borax, borate of lime, ulexite, silicon, natural mineral soap and salts of nickel are shown. There are a large number of other specimens.

Throughout the Exposition are kept complete bulletins of up-to-date mining news from Nevada, posted in the Nevada space, consisting of clippings from the most prominent Nevada newspapers.

WASHINGTON STATE will gain a strip of territory several miles wide and nearly 100 miles in length, containing some of the richest mines in the Northwest, according to the statement of the Dominion Government Boundary Commissioner, Robert McArthur. He will co-operate with the American surveyor, Sinclair, in making an accurate survey through the Mount Baker, Midway and Republic districts, as far east as the Rocky mountains. Last season much difficulty arose over the absence of the line, the landmarks of what was supposed to be the boundary being undoubtedly 2 or 3 miles too far south. Now McArthur makes the statement that the line originally surveyed was but a trial and was never put through properly. He says the definite line will give the Americans all the rich mines and other valuable property. The surveys of 1859 and 1861 were never completed. A very complete geodetic survey is now to be made, the work on which will last at least three seasons.

The exportations of petroleum oils for the fiscal year 1900-01 will probably be the largest in the history of this industry. In the quarter century from 1876 to 1900 the total value of mineral oils exported from the United States was about \$1,200,000,000, an average of about \$48,000,000 a year; and during recent years has averaged about \$60,000,000 per annum, or \$5,000,000 per month. One feature of the development of the industry is the decrease in the price to the consumer during this period, in which exportations and their net value have been increasing. The average value of the illuminating oil exported in 1876 was about 15 cents per gallon, and in 1877, an exceptional year, 20 cents per gallon. In 1881 the price was about 10 cents per gallon. In 1891 about 7 cents per gallon, and in 1898 the average export price was about 5 cents per gallon. In the nine months of the fiscal year the average export price has been 6½ cents a gallon.

The longest completed tunnel is at Schemnitz in Hungary; a drain tunnel from the mines to the Grau valley is 10 miles long. Its section is 10 feet by 5 feet 8 inches. It was commenced in 1796, but not completed till 1878. The total cost was about \$5,000,000.

Coal Handling.

The Robins Conveying Belt Co. of New York have recently installed a coal-handling apparatus at the works of Jones & Laughlins, Ltd., Pittsburg, to carry coal from the river front to the coke ovens, which the accompanying illustration shows. The amount of coal conveyed daily varies from 2500

rapid without loss of efficiency. Expressed in another way, the power applied in discharging the cell is the equivalent of the heat applied in reducing iron from the oxide in a blast furnace. In the former case the power is retained, or becomes latent, by what may be termed the further burning of the nickel oxide. In the blast furnace it is the carbon of coke which is burned, but the heat of burning becomes sensible in-

pyrites, is soon dissolved by the cyanide present, and, under the action of the electric current, the aurocyanide of gold thus produced is broken up and the precious metal precipitated on the amalgamated plates. The agitation is continued for about eighteen hours, after which the pulp becomes valueless, its precious metals (not only gold, but also silver if present) existing as a mercurial amalgam on the sides of the vat. The now worthless sludge is at once discharged to the tailings dam, from which the water, after settling, is pumped back for further use. This operation is repeated until the amalgam has accumulated sufficiently thick to warrant its removal, when the plates are scraped, and the amalgam is retorted, melted and poured into ingots of practically pure gold ready for sale. Since the introduction of the process at the South Kalgurli mine it has treated upwards of 1500 tons of refractory sulpho-telluride ore, for a recovery of over 90% of its gold contents, and has reduced by upwards of 10s (\$2.50) a ton the cost of treatment.—Australian Mining Standard.

CONSTRUCTION of the Transsiberian Railway was begun at Vladivostok, on the Pacific coast, in 1891. In 1900 the constructed line was 3375 miles and the total length with Manchurian and other branches was 5542 miles. The total cost of the railway, with all its branches and auxiliary undertakings, amounts to \$400,000,000. It runs near the 55th parallel through the southern portions of the three main divisions, viz., Western Siberia, in which gold, silver, copper, precious stones, iron and coal have been discovered; Central Siberia, the upper basin of the Yenisei, rich in gold, silver and copper, and the Amoor and coast territory, richer in gold than either of the others, in which, in addition, have been found tin and quicksilver. In the Central district is Lake Baikal, over 400 miles long, across which at a width of 40 miles the trains will be ferried by a specially constructed ice-breaking steamer. The entire journey from Tcheliabinsk, on the eastern base of the Ural mountains, to Vladivostok will take two and a half weeks.

Coal Handling Apparatus.

to 3000 tons, and as the elevator and conveyor can easily handle 500 tons per hour the daily consumption of the thousand coke ovens dependent on the system can be cared for in a single shift including the time lost in shifting boats and other similar delays. The enormous quantity of coal handled daily and the low cost at which the work is done place this system ahead of any known installation of a similar nature.

The elevator consists of a double row of steel buckets each measuring approximately 4 feet long by 2 feet wide and 2 feet deep and these buckets, seventy in number, are attached to a steel chain. The elevator is supported at its head and foot on a boom which is moved in an inclined plane by an electric motor and in this way its position can be adjusted to any stage of water. Another motor drives the chain and a third warps the coal barges into position and moves them along under the elevator as fast as the coal is removed. Through these three motors one man operates the entire system controlling the working of the elevator and shifting the boats with perfect ease. This elevator was designed by Jones & Laughlins, Ltd., and built at their works.

At the head end of the elevator the coal is delivered to a Robins conveyor of the 30-inch size. As shown in the illustration, the conveyor first runs up a somewhat steep incline, the grade being 20°. After reaching a sufficient height the conveyor runs horizontally, crossing several railway tracks, including the main line of the Baltimore & Ohio railroad, over which it passes at a height of 24 feet. Near its inshore end it takes an upward curve and on reaching a height of 68 feet delivers its load to another similar conveyor running nearly at a right angle to the first. This conveyor is 250 feet between centers. The second conveyor delivers the coal into three hoppers, distributing it equally between them and automatically ceasing to deliver into a hopper as soon as it is filled. This is accomplished by means of "trippers" and an arrangement of chutes designed by the builders, the Robins Co. Both conveyors are driven at the end where they receive the load, and not at their head ends, as one would expect. By this arrangement the motor of the long conveyor is located in the house which also contains the elevator motors, and this concentration of the power plant is of undoubted convenience.

THE positive element in Edison's storage battery corresponding to the zinc in a primary cell is iron. The negative element corresponding to the carbon of the primary cell is a superoxide of nickel believed to have the formula NiO_2 . The electrolyte is potash, in solution 10% to 40% by weight, but preferably 20% of potassium hydroxide. The mechanical structure and appearance of the plates is so similar that it is difficult to distinguish them with the eye. The difference is in the chemical contents of the pockets. In charging, oxygen is pulled away from the iron and delivers it temporarily to the nickel. Discharging lets the oxygen fall back to the iron. The electrolyte only acts as the carrier for the oxygen. The rates of charging and discharging are alike. The periods of time can be changed and made more or less

stead of latent. In discharging the storage cell the burning of the iron to iron oxide again releases the heat of combination as power. The efficiency of the storage cells as compared with the lead cells used is about as $2\frac{1}{2}$ is to 1—that is, for the same capacity of effective storage of electric storage the new Edison cell will weigh only two-fifths as much as the lead cells. It has further advantages in its ability to stand abuse. It can be carelessly handled and still do good work without deterioration.

Electrolytic Gold Saving in Western Australia.

The Riecken electrolytic process for the treatment of highly refractory sulpho-telluride ore, installed at the South Kalgurli mine, Kalgoorlie, West Australia, has now been in operation for nearly three months. It has taken the inventors nearly four years to complete the perfection of the process, and its success is now regarded as assured. The result is mainly obtained by the electrical precipitation of the gold. This precipitation is performed without the hitherto necessary step of separating the dissolved gold from the ore by leaching, settling or filter pressing. The process may be defined as a vat in which is charged the prepared ore made into a pulp with cyanide solution, and, after being allowed to remain therein for a specified time, has its precious metals withdrawn and saved, while the worthless pulp may at once be thrown away. Thus it is hardly more complicated than that simplest of all gold processes—the amalgamation of free gold. The essential portion of the Riecken plant consists of two vats, called "electro vats," each about 12 feet long, 11 feet deep and 8 feet 6 inches wide. In these two vats ore at the rate of 1200 tons per month is now being treated.

The vats are really open iron tanks with vertical ends, inclined sides and rounded bottoms, and are provided with proper beaters, with which the pulp is kept constantly agitated. The bottoms and inclined sides of the vats are lined with removable amalgamated copper plates. Bars of iron are suspended from the sides and bottoms, and distant therefrom and from each other about 18 inches. These form the positive pole of an electrical circuit, and the amalgamated copper lining constitutes the negative pole. The plates are maintained in a perfectly bright and active condition by a spray of mercury which issues from a perforated pipe at the top of the vat. The mercury runs down the plates in a thin, perpetually moving sheet to the bottom, passes out through a trap and is again elevated to the top of the vat by an air lift, and by this means a constant circulation is maintained. To put the matter in a nutshell, the treatment merely consists in charging the pulp, prepared in the mixing vat, into the electro-vats, adding a weak solution of cyanide, and then, by maintaining the flow of mercury and passing through the vat a current of electricity of about 15 volts potential, two-thirds ampere per square foot of cathode surface, the following effects are produced: The coarse particles of gold are rapidly and mechanically amalgamated by reason of the large surface of amalgamated plate presented in a state of maximum efficiency. The gold too fine to readily amalgamate, or that which is coated with a protective film, or enclosed in microscopic crystals of

Mining and Metallurgical Patents.

Patents Issued May 28, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 675,319; W. S. Boyd, 3rd, Los Angeles, Cal.

A cylinder formed with grooved legs and a pendent bracket, a bed plate formed with arms, rails supported on arms providing tracks for grooved legs of cylinder, a feed screw working in pendent bracket, turning in arms of bed plate, and having an operating hand wheel, a plug secured to front end of the cylinder, a plug secured to rear end of cylinder, a drill shaft, mounted in front plug, having a removable head, a spring for throwing drill shaft rearward, a striker shaft mounted in rear plug, having a removable head, a spring for throwing striker shaft forward, a collar mounted on striker shaft, having radial arms, a driven bevel gear wheel mounted on rear plug having cams to impinge against radial arms for retracting shaft, and a driving bevel gear wheel journaled to cylinder and meshing with driven bevel gear wheel.

ORE PULVERIZER.—No. 675,264; A. C. Calkins, Los Angeles, Cal.

A concave bed and an oscillating shoe or muller having its upper surface lowest in the middle and having in its middle an opening through same to space between shoe and bed.

ROCK DRILLING MACHINE.—No. 674,881; M. Shuster, Great Falls, Mont.

A frame or carriage and drive gearing, a drill head mounted to oscillate and to reciprocate in carriage, a rotating hammer, a striking pin to be engaged by hammer and having a ball-and-socket connection with drill head, means for normally holding striking pin out of path of movement of hammer, means for moving striking pin into path of movement of hammer, and catch device for holding striking pin in the last mentioned position until struck.

APPARATUS FOR SCREENING PULVERIZED MATERIAL.—No. 675,057; T. A. Edison, Llewellyn Park, N. J.

A series of short, stationary, inclined screen sections each formed of a thin plate slotted in direction of flow of material, means for causing material to flow by gravity successively over screen sections, means for feeding material to upper end of upper screen section in a thin, wide stream, and means for checking velocity of particles after they have passed over each screen section except last.

MAGNETIC SEPARATOR.—No. 675,056; T. A. Edison, Llewellyn Park, N. J.

An oblong bar magnet wound over length of bar and arranged in horizontal position so as to present

a laterally extended polar face, in combination with means to feed the mixed magnetic and non-magnetic material directly to the polar face of magnet, and means for automatically and separately receiving magnetic and non-magnetic particles continuously separated by the magnetic action.

FURNACE FOR THE REDUCTION OF ZINC ORES.—No. 674,936; H. B. Meech, Denver, Colo.

In series retorts arranged side by side, the walls of retorts formed of tongue-and-grooved firebrick, each retort having solid bottom and an opening at two opposite ends, a door closing each opening and means to open and close doors, a flue between retorts leading from a firebox to a point of exit, a firebox beneath each flue, fireboxes arranged to open alternately from opposite sides of furnace.

HYDRAULIC MACHINE FOR EXTRACTING GOLD FROM SAND IN PLACE.—No. 675,123; G. S. Bartholomew, Los Angeles, Cal.

A cup; a table fastened to the cup and extending through bottom thereof, and opening beneath cup; means for forcing water through tube; and one or more pockets fastened on tube beneath cup, and provided with inlet openings extending inward from periphery of the cup.

ROCK DRILLING MACHINE.—No. 675,202; L. Durkee, Denver, Colo.

The cylinder of a drill holder reciprocally mounted in cylinder, and provided with two removable abutments, a drill-bit-holding chuck on outer end of drill

holder, a sleeve loosely surrounding rear end of drill holder and arranged to bear against one of removable abutments of drill holder, a rifle bar threaded to rear end of drill holder and provided with a collar arranged to confine sleeve to drill holder and a spring-pawl-controlled fluted nut, revolvably mounted in rear end of cylinder and on rifle bar.

MINERS' COMBINATION TOOL.—No. 675,058; J. J. Elliott, Denver, Colo.

Two crossed members pivotally connected and provided with co-operating jaws located forward of pivot, one of jaws being reinforced at forward extremity and grooved in plane of co-operating jaw to receive fuse extremity, opposite jaw being sharpened at its forward end to perform the fuse-splitting function.

MAGNETIC SEPARATOR.—No. 675,162; B. Noble, Detroit, Mich.

An iron cylinder, iron studs secured to and projecting radially from cylinder and arranged to form a circumferential and longitudinal series of pairs, coils upon studs connected in electric circuit to form magnets alternately of opposite polarity in both circumferential and longitudinal series, all magnets being magnetically coupled by cylinder, whereby a substantially complete magnetic circuit may be formed by the separated magnetic material bridging between any pair of opposite poles, and a non-magnetic sheathing surrounding studs and coils.

HEATING AND ROASTING FURNACE.—No. 675,281; A. W. Johnson, Tacoma, Wash.

The roasting hearth and an ore stirring device, a support for ore stirring device, support consisting of an upright portion having at its lower part an inwardly extending base and at its upper part an inwardly extending shield deflecting downwardly at its front, the upright, base and shield one continuous piece in cross section, and base having means for attachment of a rail for ore stirring device to rest upon.

PROCESS OF REDUCING METALS AND PRODUCING ALLOYS THEREOF.—No. 675,190; H. S. Blackmore, Mount Vernon, N. Y.

The process of reducing metals, which consists in exposing a molten bath of inert chemical salts free from hydrogen containing metallic oxide at a temperature below its normal melting point, to the action of metallic carbide, thereby liberating combined metal or metals.

The Mount Ceniz railway tunnel, 8 miles long, cost \$370 a linear foot. The St. Gothard tunnel, 9½ miles long, cost \$235 a foot. The Arlberg tunnel, 6½ miles long, cost \$175 a foot.

MINING SUMMARY.

MINING AND SCIENTIFIC PRESS.

ALASKA.

The opening of navigation this season has taken in a large number of people into Nome and the surrounding country. Reports from Port Clarence and other lately discovered districts that have come out by mail during the winter have been of a satisfactory character, and the Nome country should make a considerable gold output this year.

According to Dr. T. J. Vaughn Rys, the Aleutian islands contain gold placers. Two years ago Dr. Rys prospected Unimak island and found sulphur in abundance, but could not ship it, as that island has no harbor. At that time several seal hunters and fishermen found placer mining profitable and he was told by other prospectors that the Aleutians contained both placer ground and gold-bearing quartz. Most of the islands have good harbors, which are open the year round.

The report of the Alaska-Treadwell mine for May shows the quantity of ore crushed was 55,443 tons, yielding \$63,650. There were 1122 tons of sulphurets saved, value \$34,830. The total receipts were \$106,930. The ore shows an average of \$1.95 per ton. The gross expenses were \$47,816.

From Forty-mile comes news of new discoveries on creeks not heretofore considered of value. Good pay has been found on Hunter creek and several forks of Jack Wade creek. The district anticipates the busiest season to date.

ARIZONA.

MOHAVE COUNTY.

It is said the Philadelphia & Arizona M. Co., operating near Kingman, will close down the Merrimac mill and close work in the stopes, keeping two shifts in the shaft, which will be sunk to 500 feet. Inability to save the ore values in the mill is said to be the cause. A new 100-ton mill will be erected at the mine immediately.

CALIFORNIA.

ALPINE COUNTY.

The Lewis or Boulder Hill mine, near Monitor, owned by H. F. Musser of Markleeville, has been bonded to Pittsburg people, who are developing the property. P. Curtz is Supt. The old Colorado mill at Monitor has been repaired to make a mill test on the ore, of which there are several hundred tons on the old dumps, some of it high grade but not yielding well to free-milling treatment.

AMADOR COUNTY.

Three Italians, arrested on suspicion of theft of gold, were searched and one small satchel yielded specimens of rich gold quartz estimated to contain about \$1000. They admitted that the specimens were taken from the Keystone mine dump at Amador City.

BUTTE COUNTY.

The Banner mine, near Oroville, has been sold to W. P. Lynch and L. J. Hohl of Cherokee, who buy the property for the machinery and buildings. The mine is to be abandoned, as operating it is unprofitable.

The largest gold dredger on the Pacific coast has been started up in the Oroville dredging field. It is operating in south Thermalito, about 2½ miles west of Oroville, and is the property of the Boston & Oroville G. D. Co.; W. P. Hammon of Oroville, manager. It is the first of a series of five for the company. The hull is 86 feet long by 30 feet wide, with a depth of 7 feet. Without any machinery whatever it will weigh about 135 tons. The weight of the machinery is approximately 130 tons more. This machinery is of the Risdon standard pattern with buckets of 5 cubic feet capacity each. The dredger will work to a depth of 35 feet below the surface and stacks the tailings to a height of 30 feet above the surface. The machine is operated by electricity from the Butte County Electric Power Co. Eight men are employed, and the ground is expected to be handled for less than 4 cents per cubic yard.

CALAVERAS COUNTY.

Work is progressing at the Fanny Maria mine at Glencoe. All the old machinery is being removed and will be replaced by a heavier plant preparatory to unwatering the mine. A payment on the purchase price has been made.

A. Lundberg of the Fine Gold mine has men at work upon the mine under the management of W. Moyle.

W. E. Emery of the Duchess group of mines at Vallecito has a large number of men employed in the mine and grading for a stamp mill. Mr. Emery has also, under the management of G. H. Lewis,

the Avalanche gravel mine, a hydraulic proposition. Over two miles of ditch have been made, 1300 feet of hydraulic pipe laid, and a large debris dam constructed. It is expected that hydraulicking will begin about the first of June.

The smelting works of the Union copper mine at Copperopolis were destroyed by fire on June 4th. This is the mine bought by Mr. Green, son of Mrs. Hetty Green, from the estate of the late Frederick Ames of Boston.

EL DORADO COUNTY.

A new slate quarry has been opened at Kelsey by the Bangor Slate Co., which has bought 280 acres of land of J. C. Murphy, 120 acres of Hanley and 40 acres of Hoffman—440 acres in all—at about \$30 per acre, it is said. Six men are at work.

Work on the Plumb mine, near Folsom, has been begun by a company of Oakland capitalists. P. Gray of Shingle Springs and J. Wing of Mormon Island are superintending the work.

It is reported that a rich strike has been made on the 800-foot level of the Larkin mine.

The Mt. Pleasant mine, Grizzly Flat, laid off its miners last week until new boilers can be installed. Burreigh drills will also be added to the equipment.

KERN COUNTY.

The Yellow Aster Co. of Randsburg has re-elected J. Singleton president and R. L. Burcham secretary.

The King Solomon group, near Randsburg, owned by the Ashford M. Co., has been bonded to L. R. Garrett of Los Angeles for one year. Work is to be continuous; \$1000 is to be paid in four months and \$12,000 more in one year; P. McMahon is Supt.

MADERA COUNTY.

Chicago capitalists are said to be considering the reopening of Quartz Mountain, formerly worked by a French company.

On the old Star mine, on Mt. Raymond, H. Krohn is superintending the installation of new concentrators.

MARIPOSA COUNTY.

The Mariposa mine, on the Mariposa Grant, was worked intermittently for many years, the lowest workings then being 275 feet. The Mariposa Co. has been about eighteen months at work, has sunk 800 feet in a new shaft and has run 3000 feet of levels. On the 800-foot level the ledge was found 5 feet wide and rich. From six to eight drills are used and fifty men are employed. Sixty tons of ore are crushed daily. Sinking is to be carried down to the 1000-foot level.

NEVADA COUNTY.

The mine owned by P. Dunn near Nevada City has been bonded to San Francisco people and operations will be commenced soon. The mine is close to the Mountaineer.

The bonding of the Golden West mine, Grass Valley, owned by C. Temby, C. Tregonning and J. Seymour, is reported. There is a ledge 5 feet thick on the mine, showing free gold.

The indications at the Frank mine, in the Blue Tent district, are encouraging. Some promising gravel was recently struck, and the company has decided to sink to bedrock at once. The new hoisting works have been completed.

PLACER COUNTY.

The Pioneer-Lynn G. M. Co. have closed down the mine, near Damascus, again and are examining it to determine the advisability of continuing work. Low-grade ore bodies have been found, but will not pay to work with a 20-stamp mill.

SHASTA COUNTY.

Surveyors are engaged surveying an electric railroad from the Bully Hill mines at De Lamar to the Southern Pacific, above Kennett. The line will pass through Copper City and down Pitt river. It will be about 20 miles long and will get power from a plant on the McCloud river. It will be built immediately on the completion of the survey.

The Berg & Montgomery claim in the Centerville district is sending rich rock to the Keswick smelter. Out of a rich bunch \$800 was hand mortgaged. H. Berg and J. Montgomery are the owners. E. Shallock is working the mine on a lay.

The strike made by Boswell & Johnson on Main street, Shasta, has developed into a well-defined ledge, showing free gold and averaging about 2 feet. They are down over 30 feet.

W. Richardson of French Gulch, owner of the Expert mine near that place, made a rich strike, in making an upraise of 100 feet from the tunnel, of a streak 1 foot in width which assays \$60 per ton and is free milling.

Thirty claims surrounding and adjoining the Balaklala group in Flat Creek district have been bought by the Balaklala M. Co. for \$3750, which company now owns nearly sixty claims in a group on the sulphide belt.

SISKIYOU COUNTY.

A company is arranging to put a dredger in McAdams creek, near Ft. Jones, to work the deep bedrock gravel, so difficult to mine by other means on account of the water in the ground.

Judge O'Neill, who owned about a one-twelfth interest in the Ball mine, near Sawyer's Bar, sold his interest for \$10,000 spot cash. The same amount was offered to G. D. Butler, who refused to sell. This mine has been paying good dividends.

J. Daggett, manager of the Black Bear G. M. Co. at Black Bear, reports that a vein of quartz 8 inches in width has been struck in sinking the new shaft north of the old works.

The Lamb quartz mill at Yreka creek has made on quartz from Shurtleff's ledge in Fool's Paradise district, Shasta river, an average of about \$17 or \$18 a ton.

A mining man of San Francisco has been communicating with Yreka people in reference to establishing a portable smelter at Forks of Humbug, which it is claimed will treat ores of Humbug district that do not realize well in the stamp mills. The Humbug quartz contains arsenic, sulphur and other rebellious substances that make milling unsatisfactory.

The Greenhorn blue gravel mine is to be reopened.

TRINITY COUNTY.

The Last Chance M. Co. of Philadelphia, Pa., has made the first payment on the Given ranch at Junction City. The company expects to install a dredger there before the rainy season begins.

The Sweepstake H. G. M. Co., near Weaverville, have obtained water rights on Grizzly creek and plan to bring water to the mine on a line 20 miles ditch and 20 miles of 30-inch pipe. The contract for the pipe has been let. The work is estimated to cost \$750,000. It is stated that a sale of the mine has been made at a very large figure.

TUOLUMNE COUNTY.

E. H. Williams, Supt. of the Golden Treasure mine, near Big Oak Flat, says that 40 feet down the ledge is 2 feet wide, at a point where rich specimen rock was taken out.

YUBA COUNTY.

J. E. Doolittle, associated with John Hays Hammond in dredger mining in Butte and Yuba counties, has a bond on 2000 acres of the Newbert farm, owned by J. O'Brien, below Smartsville, and says development work will be resumed there soon.

COLORADO.

BOULDER COUNTY.

The Wood Mountain M. Co. has paid the Woods-Phillips estate for the mine at Boulder and has \$35,000 in the treasury, in anticipation of the immediate erection of a new mill, which will have a capacity of about 150 tons a day, amalgamating and concentrating.

CHAFFEE COUNTY.

The Stockton group of copper claims near Cleora have been bought by a company of South Dakota men. A shaft is being sunk on the vein and a tunnel is being driven which will cut all the veins 200 feet deep.

CLEAR CREEK COUNTY.

D. P. McDonald of Denver and Idaho Springs people have bought a mill site at Idaho Springs, a water right, have plans nearly completed and are at work on the construction of a custom mill for milling concentrating ores. The plant and machinery is to be of the latest and best types. The power will be electricity. The mill will be built for 100 tons capacity, but is so arranged that it can be enlarged. Contracts with large shippers in Clear Creek and Gilpin counties have already been made, insuring business from the start. O. W. Lowell is secretary and treasurer of the new enterprise, D. P. McDonald of Denver is president and A. H. Roller manager.

The May output of the mines of the Idaho Springs district shows a tonnage of 1800 tons at \$50, or \$90,000; 19,300 tons at \$12 per ton, or \$231,600; making a total tonnage of 21,100 tons, of a value of \$321,600.

GILPIN COUNTY.

The Bertha M. & M. Co., which recently bought the Anderson mill at Idaho Springs for the Newhouse tunnel ores, is now planning for a 10-stamp mill on its own mill site at the mines. The proposed mill is for testing different grades of ore before shipping.

Michigan parties are organizing a company to operate the Wheel of Fortune group near Black Hawk. They intend putting up a new shaft building and machinery. T. O'Hea will be Supt.

Chicago parties have bonded the Eldorado claim in Russell district, near Central City, owned by H. Williams. The shaft is about 200 feet deep and is being retimbered under the management of W. Shull. A whim is being put up for temporary

purposes, but a power hoisting plant will be put in when the work of repairing the shaft is completed. A company will be organized by the lessees.

The Stephens Investment Co. have sold to the Robert Emmet G. M. Co. the Queen of the West and Golden Gate lode claims, situated in Chase gulch, for \$25,000. W. H. Nicholls is manager.

The total number of cars of ore, smelting and crude, and mill concentrates shipped from Black Hawk for treatment during the month of May was 319—a total tonnage of 5742. This is the largest monthly shipment made this year.

It is reported that H. Bolsinger has a company to take the Hubert property at Nevada ville and that work will soon be started.

GUNNISON COUNTY.

G. W. Grifley and J. Gordon, owners of the Rustler mine, in the Gothic district, will soon begin work on the property. In early days, transportation and smelter charges were so heavy that the owners did little work. It has lain idle the greater part of the time since 1873. The present owners bought it from the Buck estate. Last year they opened the vein in various places. The vein is about 3 feet wide and carries 6 to 18 inches of high-grade material. The mine is located at an altitude of 13,600 feet.

HINSDALE COUNTY.

A strike has been made by the Red River Co. at Lake City. At 1154 feet from the mouth of the Lellie crosscut and 900 feet down the vein was cut into and found 17 feet wide, with pay streak of 3 feet. The owners are Boston people, who will build a concentrating mill.

LAKE COUNTY.

Leadville mines from May shipping account show an estimate production of 80,000 tons of ores, estimate value \$1,300,000 of gold, silver, lead and copper. The amount of development at present under way will add more production to the present rate as the season advances.

At the Ruby mine on Iron Hill the lessees, Horrigan, Dale and associates, expect some important developments soon. Some time ago at the 700-foot point the shaft entered 15 feet of high-grade sulphides carrying values in gold, silver, copper, lead and bismuth. Arrangements have been made to install a pumping plant and open drifts in the ore body. The mine will now be unwatered.

A. J. Davis of the firm of E. O. Jacobson & Co., of New York City, who have been the principal purchasers of zinciferous ores at Leadville for export to spelter works in Belgium, recently inquired of Leadville's zinc mine owners and operators as to their ability to furnish him a steady heavy output for five years in advance for a new \$300,000 mill which he contemplates building in the Arkansas valley, to concentrate Leadville's zinc-lead sulphides. Antwerp, Belgium, capitalists who have concentrating works saving 95% of the metal content of gold, silver, copper, iron and zinc are willing to finance this modern and extensive separation works provided they can be assured of a five years' supply. The composition of the ore is familiar to them from smelting thousands of tons of it. Mr. Davis is quite satisfied as to the feasibility of the undertaking and exhibited plans and drawings of the great Belgium works.

SAN MIGUEL COUNTY.

The San Juan G. M. Co., at Telluride, have made the final payment for the Bessie group—\$18,000—closing the deal made three years ago, when the company bought of Watton & Dowd the Montezuma, Gen. Hancock, Little Sioux, Bessie, Leadville, Little Girl, Black Eagle, Olga and Baldy claims. It is probable the management will be consolidated with that of the Alta, as the purchasers of the Alta are the principal stockholders in the Bessie Co.; A. C. Koch will be local manager.

Two weeks' run at the Butterfly-Terrile mill produced 360 ounces, valued at \$5400, and a car of concentrates worth \$1000.

SUMMIT COUNTY.

Chicago people have made a contract to buy the Nil Desperandum property in Galena gulch, near Breckenridge, for \$30,000. The property consists of the 15-stamp mill and the Gold Bug and Nil Desperandum gold mining claims. J. Olsen is to be Supt. for the new owners.

TELLER COUNTY.

The Portland mine, at Victor, is reported sold to Londoners, either Werner, Beit & Co. or the Venture Co. The price paid is said to have been \$15,000,000, though it may be less. The mine has paid \$41 a share in dividends and is said to have ore bodies exposed equal to its production to date. The Portland and Stratton's Independence adjoin. The two properties have produced \$12,000,000 and paid \$3,000,000 in dividends. The two can be worked economically together.

R. Prosser has leased for fifteen months,

from the Woods Investment Co., the Anna May Wells at Cripple Creek and has put men at work prospecting.

It is officially said that the Last Dollar G. M. Co. will pass the quarterly dividend on account of expense of permanent machinery and development work. The statement to the stockholders shows \$42,500 in cash on hand, and that there has been ore production returns amounting to \$694,773.12 from April, 1896, to January, 1901, with a profit of \$162,128.47, out of which has been paid \$120,000 in dividends.

The contractors on the new 600-foot level of the Blue Bird at Cripple Creek are taking out ore running from \$20 to \$30 a ton. The shaft has been sunk about 400 feet in three months and is at the 900-foot station.

The Damerall G. M. Co. at Cripple Creek, composed of Boston capitalists, is prospecting its ground under the management of D. Heaton. Several veins assaying from \$5 to \$23 a ton have been discovered.

The production of Cripple Creek for May is estimated at \$1,720,000, a falling off as compared with former months, owing to the shutting down of the Portland. This decreases the tonnage by about 6000 tons of smelting grade ore. The decrease is also added to by the Elktown property dropping from 2000 tons to about 800 tons. The Eclipse and Golden Cycle have largely increased production. The Colorado-Philadelphia R. W. handled 18,000 tons; average value per ton, \$30; gross value, \$540,000; Union, 6000; \$30; \$180,000; Economic, 1000; \$30; \$30,000; Metallic, 7000; \$30; \$210,000; El Paso, 3500; \$30; \$105,000; smelters, 9000; \$70; \$630,000; miscellaneous, \$25,000; total, 44,500 tons; gross value, \$1,720,000.

IDAHO.

ADA COUNTY.

D. Southworth will shortly begin construction of a small quartz mill on property owned by his company on Blacks creek, about 13 miles from Boise in the Neal district.

The Idaho & Seven Devils M. Co., Ltd., has incorporated to operate mining property. The place of business will be Boise City, and the directors are: W. S. Neal, N. W. Bower, C. H. Roberts, J. R. Good, all of Boise, and F. Alers of Helena, Mont.

BLAINE COUNTY.

At Bullion, the Jay Gould is operating under lease with a small force and making some shipments of galena and gray copper.

The Democrat, owned by the Della Mountain M. Co., comprises five patented claims, 6 miles northwest of Hailey, ships forty to fifty tons a month of ore running 70% lead and 123 ounces silver.

The Bullion, leased to W. H. Watt of Hailey, operates with a small force and ships ore that runs 68% lead and 145 ounces silver.

The Idahoan, at Bullion, also under lease, is making small shipments. Its ores run about 67% lead and 65 ounces silver. The Red Elephant, in same locality, will soon start up.

The North Star, located up East Fork, which belongs to the Philadelphia & Idaho Co., is working and shipping under lease to J. Anderson and Bud Humphrey. Twelve miles west of Ketchum is the Sunday group, operated by Thos. O. Hampton as lessee.

The Tyrannis, owned by H. M. Richard and J. S. Thorndike, of Paris, is working with a small force of men. A mill is being erected.

The Minnie Moore, at Bellevue, in charge of Mr. Tustin, is being retimbered in places, the levels cleaned out and put in condition to resume work.

Hailey, Idaho, June 1.

The Seattle Co., developing the Richardson and Junction groups of claims on the Gold Belt, near Hailey, will take up the bonds and begin permanent development, the work done under the management of J. Richardson being merely to prospect the ground.

The crosscut from the 500-foot level of the Golden Star, at Hailey, has cut into the vein, finding it regular and well defined as on the upper levels, with the usual dip of 45°. The course of the vein being ascertained to this depth, a vertical shaft will be sunk, as the vein is too far from the incline.

IDAHO COUNTY.

F. J. French, general manager of the Blue Jacket Con. C. Co., in the Seven Devils district, says his company is putting down a three-compartment shaft to a depth of 500 feet.

SHOSHONE COUNTY.

The strike on the Humming Bird is said to be better than at first reported. The blind lead where cut carries 3½ feet of carbonate ore, upwards of 2 feet of which is expected to be of shipping grade. Much of the ore is full of crystallized lead.

The Golden Chest M. Co. is negotiating to buy several miles of placer ground on

Butte creek, and water rights, with the intention of running the stamp mill by water power. E. Behr has been appointed as manager.

The Hornsilver M. & M. Co. has incorporated; capital, \$100,000; with principal office at Wallace. The directors are: T. B. Johnson, A. Steers, J. Taylor, J. F. Metz, M. L. McNeil, N. Wittner and P. Erickson of Wallace.

WASHINGTON COUNTY.

The Heath M. Co. has bought the Brown-Stemwinder groups in the Heath district. F. Fairbairn of Philadelphia closed the deal for the company. R. T. Woliston has been engaged as superintendent and development work will be done this season.

MICHIGAN.

HOUGHTON COUNTY.

The Calumet & Hecla will install electric power to work the six stamp heads in new mill at Lake Linden. The old hoisting engine at the mine will be remodeled, furnishing 1000 kilowatts for operating stamps and the new sand wheel, which is 62 feet in diameter, 12 feet larger than the two wheels now in use.

MONTANA.

FLATHEAD COUNTY.

It is reported that a cyanide plant will be built in West Fisher district by Denver men, so J. E. Clark, who has been examining several of the properties in that district for them says. The Lake claim has been bonded by Mr. Clark and he will begin work at once. He says the ledge is about 3 feet wide and that the values range up to \$50 a ton.

A stamp mill is to be built on the Mother Lode in the West Fisher district. W. J. Beager, the manager, says it will be completed by October.

The Brick & Brannagan mill is crushing twenty tons a day. Work is being prosecuted in both tunnels, the upper one being in 360 feet and the lower one 90 feet. The saw mill has been started to cut lumber for a flume, which will furnish water power to operate the mill.

Greenwell & Vaughn have sold their placer claims on Libby creek for \$25,000 to E. Haskell, a Wisconsin capitalist, who will install placer mining machinery. Several years ago the owners ran a tunnel from the creek level to strike a lead which they had found on the mountain side above. Several hundred feet of this tunnel was run in pay gravel. The owners have been constantly developing their ground since then.

GRANITE COUNTY.

J. H. Ortman, manager of the Crescent G. M. Co., operating near Phillipsburg, is driving a 1500-foot tunnel to cut the lead 800 feet down, when the company will build a mill.

LEWIS AND CLARKE COUNTY.

About twenty men are employed on the Gray Eagle, near Comet, by J. Lind of Minnesota and his associates, who have bonded it for eighteen months at \$100,000 and 25% royalty from J. J. Holmes and the Dahlman Bros.

The Cataract C. M. Co. has incorporated in South Dakota and bought claims on Cataract creek, near Basin, and has begun work on them. G. M. Hays of St. Helena is president, J. H. Calderhead secretary and M. L. Hewitt of Helena is general manager.

Forty acres in Kenwood, formerly the Barden tract, has been bonded by Platt & Heath to L. S. Woodbury of Great Falls at \$5000, and one of the conditions is that work shall be commenced at once. Surface prospecting has shown a well defined vein which carries gold, silver and copper.

MISSOULA COUNTY.

The St. Regis C. M. & M. Co. has incorporated, capital \$300,000, to mine near St. Regis. W. H. Houston and T. N. S. Leterman of Missoula and F. W. Wilson and L. McHefey of St. Regis are the incorporators.

PARK COUNTY.

The Yellowstone mine, Castle district, near Livingston, is making preparations to resume operations.—The owners of the Great Eastern recently struck a rich pocket, from which they have taken \$40,000.

SILVER BOW COUNTY.

The United Copper Co. of Montana has incorporated under South Dakota laws, with \$80,000,000 authorized capital. It is stated that the company is entirely independent of the Amalgamated Copper Co. The Montana O. P. Co., which is said to be producing copper at the rate of 40,000,000 pounds a year, will be included.

NEVADA.

The new copper works at the Bluestone mine, in Mason valley, have been started up and will treat from 150 to 200 tons of ore per day. The company expect to ship about one carload of copper matte daily. The lead varies in width from 10 to over

100 feet. Some of the ore is very rich, crystallized sulphate of copper or blue-stone being one of the minerals.

J. J. O'Connor has sold to W. J. Sisson the White Elephant mine and a one-third interest in the Butcher Boy claim near Denio. This mine is a free-gold proposition. Men have been put to work.

LINCOLN COUNTY.

The mine below Bunkerville, at Copper King, is said to be developing excellently. The copper ore is not of a high grade, but of a fair paying average. The ore that goes low in copper goes high in nickel.

In Searchlight district the Quartette Co. is working a large number of men. Three miners extracting ore keep the 40-ton mill running. The company is doing considerable development work.

The Perew mines are working about twelve men. The ledge is said to be narrow but rich.

Colton & Rose are preparing to start up work on the Searchlight group.

The Horseshoe mine and mill at Fay are handling about 2850 tons of ore per month, the product being auriferous cyanides of the value of about \$18,000. J. MacFarland is superintendent, but is now in South America; Louis Seckels is secretary of the company, with offices in Salt Lake City.

LYON COUNTY.

F. A. Bierke of Virginia City has sold to San Francisco people the Oest mine, near Silver City; the price is said to be about \$100,000.

WASHOE COUNTY.

G. W. Pettigrew & Co. have bonded ten mining claims in the Steamboat district to San Francisco parties, who are now sinking a shaft.

The Reno Star, or the Wedekind mine, situated 4 miles northeast of Reno, has been bought by J. Sparks for \$175,000. The new owner will begin the development of the mine on a large scale at once, installing machinery and putting several hundred men to work. V. Wedekind, the discoverer, who made the sale, is an old man—a piano tuner—who at odd times kept digging into the hill for pay dirt, to the amusement of the neighborhood. About a year ago he struck rich ore, and now makes this sale before he put any machinery on the mine.

NEW MEXICO.

The Torpedo M. Co., at Organ, is putting in a new 60 H. P. boiler, adding to the present plant. A new stationary pump, capacity 800 gallons per minute, will be installed. A strike has been made in the lowest level of mineral running high in copper and more silver than any ore before found.

GRANT COUNTY.

R. C. Ross and A. W. Tennant have bought the Clear Lake M. Co.'s property at Steele Rock for \$150,000. They propose to put in more machinery. Mr. Ross will be manager for the new company.

SOCORRO COUNTY.

J. R. DeMier of Las Cruces, lessee of guano and phosphate fields on the Armandaris land grant, near Lava station, on the A., T. & S. F. R. R., says he is shipping about six tons of guano and phosphate daily to California, where he has contracts with orange orchard owners.

OREGON.

GRANT COUNTY.

It is said that a payment of \$4000 has been made on the Climax mine at Granite, owned by J. F. Hardee. The full price is \$16,000, the payments in installments. The Climax was located on July 4, 1899, was developed by Mr. Hardee by a tunnel 200 feet in on the vein and by several cuts and shafts.

JACKSON COUNTY.

Considerable prospecting is being done near Ashland for quicksilver. A number of prospects too poor in mineral to pay have been found and one prospect on Little Applegate creek on which a Montana company is drifting on a ledge that will pay.

JOSEPHINE COUNTY.

It is reported that C. R. Ray of Gold Hill has bought the Roaring Gimlet mine, near that place, for \$10,000 cash, after the owners had taken out about that sum from ten days' work in a pocket.

UTAH.

BEAVER COUNTY.

The Old Ben M. Co. has incorporated; capital, \$30,000; to operate the Old Ben and other mining claims in this county. W. S. Foster is president.

BOX ELDER COUNTY.

The Century mine is producing about ten tons of gold ore per day, which are being milled by stamps and amalgamation, by which a saving of \$15 per ton is made. The tailings are concentrated, whereby a saving is made, the table tail-

ings being cyanided. The mill is being enlarged to forty tons daily capacity. The mine is opened through a 240-foot tunnel, with considerable of drifting. A second tunnel is being driven to cut 150 feet under the upper workings. Dr. White, of Salt Lake City, is principally interested in the property.

Park Valley, May 27.

IRON COUNTY.

The mill to be erected at the Ophir mine, this place, by Dederichs & Burke of Salt Lake City, is to have a capacity of 100 tons per day, and will be provided with crushers, rolls, driers, two roasters, cooling floor, eight leaching tanks, six silver precipitating tanks and three tanks for the precipitation of lead, to carry out the methods of the Russell extraction process. The ore is partially chloridized, with some sulphur in combination of iron and lead. M. L. Effinger is secretary of the company.

Stateline, May 27.

JUAB COUNTY.

The ore belts of the Tintic range are susceptible of a more or less definite division. The contact between the porphyry of Treasure hill and the lime belt of the Tintic hills passes through the locality of the Dragon iron mine, this dividing line veering to the north as it passes westward, leaving the Swansea group, near Silver City, in the porphyry. But, beginning with the Star, in the lime belt, and taking in the Boss Tweed, Red Rose, Carisa and Spy, and you encompass the known mines of copper, gold and silver on the east zone. Continuing northward, including the Utah, Sioux, Humburg, Yankee, May Day, Uncle Sam and Godiva, and we take in the silver-lead ores. This shows a division of the mines located along the east side of the range. The west zone may be similarly divided: Beginning with the Ajax and including that and the Lower Mammoth, Mammoth, Grand Central and Centennial-Eureka and we find gold, silver and copper values in a quartz-siliceous gangue. Continuing on northward we find in the Eureka Hill, Bullion-Beck and Keystone lead, silver and gold values in a sulphide and carbonate lead ore. Thus, it will be seen, that in the north end of the range are the lead ores, accompanied by gold and silver; while in the mines of the south end the copper is the base that preponderates and carries gold and silver.

On the east zone the ore shoots run longitudinally within a great north-south fissure, the material of the latter being largely an altered lime. In the Carisa the ores in the main shoots comprise gray copper, with gold and silver, in a quartz-spar gangue. Under and adjacent to the main ore shoots are secondary deposits of copper oxides, not accompanied by gold and silver, which are believed to be the result of re-precipitation from the main ore shoots. These secondary deposits are in irregular pockets. The ores thus far shipped from the Spy, running from 17% to 20% copper and 10% excess of iron, are claimed to have been largely from the secondary deposits, resulting from re-precipitation. It is believed, however, that the primary ore lenses may be reached on the Spy at greater depth. The Carisa and Spy adjoin and are included in the same ownership, A. J. Underwood being the manager. On the Spy a perpendicular shaft sinks 700 feet, from the bottom of which a level is being run southwestward to cut under the Carisa at 830 feet depth. The Carisa shaft, now down 250 feet in ore, will be continued 600 feet deeper to connect with the level from the Spy.

The Carisa ores carry 65% silica, 5% to 20% copper, 10 to 20 ounces silver, ½ ounce gold. The Spy ore carries 17% to 20% copper, 10% excess of iron and no gold or silver. This group is shipping about 800 tons per month. The Oregon Short Line has extended a spur from Silver City via the Tesora to a point near the Carisa-Spy group.

Robinson, May 23.

SALT LAKE COUNTY.

The New England G. & C. M. Co. has incorporated; capital, \$1,000,000. The head office of the company is at Denver and the mining properties at Bingham. D. W. Williams is president and E. Hewitt secretary. E. M. Gibson and W. E. Guthrie of Omaha and S. W. West of Salt Lake City are directors.

SOUTH DAKOTA.

PENNINGTON COUNTY.

The Boston-South Dakota M. Co. is preparing to begin work on the new cyanide plant projected for the Gustin-Minerva mine and mill near Deadwood.

The little cyanide plant owned by Cook & Gibbs has been leased to C. K. Weedon, T. Fallon, D. Nelson and J. Terry of Deadwood, who will operate it on ore from their own mine. The mill has a capacity of about thirty tons per day.

The Alta M. Co., just commencing to

operate in the Black Hills, is getting out plans for a 50-ton cyanide plant to be erected at the Little Blue mine in the Yellow Creek district, near Deadwood.

The Maloney-Blue Lead Copper Co. is surveying a site at Sheridan for a fifty-ton smelter. The Blue Lead copper mine has been opened for nearly twenty-five years. The company has stripped the ledge outcrop and shafts have been sunk at intervals, showing to a depth of 50 to 75 feet. At those depths an ash bed occurs, which is barren of copper value. A tunnel is being run near the water level, in the expectation of striking the main ledge of copper ore beneath the ash deposit.

WASHINGTON.

FERRY COUNTY.

Great activity is reported in Meteor and Cedar Canyon districts. People from Keller have laid out a townsite and begun preparations for building. The whole country for miles around the Meteor Swan is staked. On the Nonpareil, the Stray Dog and the White Swan properties double shifts are working. The White Swan people expect to strike the lead in July. Assays from select surface samples run very high.

CHELAN COUNTY.

C. W. Dick has run a tunnel 80 feet on the Lucky Dick claim, near Wenatchee, cutting the ledge 188 feet below the croppings. He says it is 15 feet wide, with well-defined foot and hanging walls. He has made a test shipment to the smelter.

WYOMING.

CARBON COUNTY.

The Kurtz-Chatterton Co. has decided to sink a 1000-foot shaft on their mine at Grand Encampment, which, when completed, will allow a production of 1000 tons of ore per day. Recent workings have struck a body of ore 18 feet wide.

The new custom smelting works at Grand Encampment will be completed by July 1. Its capacity will be 100 tons per day.

The Adams Copper Co. has been incorporated to operate in the Grand Encampment district; capital, \$150,000; incorporators—G. F. Adams, A. E. Humphreys, S. G. Bonney, S. W. Eckman.

FOREIGN.

BRITISH COLUMBIA.

The Slocan mining division has exported 1734 tons of ore up to date this year.

The Ivanhoe mine, near Sandon, has closed down.

Work has been resumed on the Maybe, near Ferguson, where they are driving a 200-foot tunnel.

At the Alice mine, near Creston, the vein has been cut at the 250-foot level, 3 feet wide, and carries the same grade of ore as on the 100-foot level. The ore is silver-lead, carrying twenty to thirty ounces silver to the ton. T. G. Proctor of Nelson is manager.

The Miner-Graves Syndicate will resume work on the Rockland mine, near Silverton, at an early date.

At the Richelieu Con. mine, near Crawford bay, a tramway 8000 feet long is to be constructed, connecting the mine with the end of the wagon road.

Work is to be commenced soon on the Second Relief mine, near Erie. A saw mill and stamp mill will be constructed and other improvements made.

The Tit for Tat group, East Kootenay, has been bonded at \$50,000. It is a free-milling gold property.

A strike has been made in the Silver Cup mine, at Ferguson.

The Minnesota M. & D. Co. has bought the Nellie group on Lexington creek, in the Lardeau mining division.

The Lone Star group, near Ferguson, has been bought by Toledo, O., people, who propose to open a 250-foot tunnel at once.

The V. & M. mine, at Twelve-mile, Slocan district, will put in machine drills.

The Bear Creek M. Co. of Seattle, Wash., has placer claims on Bear and Clear creeks, in Cassiar district, about 75 miles from Skaguay. A Government road is being built to the new diggings and will be completed before June 1.

At the Con. Cariboo hydraulic mine, at Bullion, a large bank blast was successfully exploded. This blast contained 4540 kegs (equal to 113,500 pounds) of powder, distributed in 1200 feet of powder drifts across the face of the bank, and broke up about 2,000,000 yards of gravel. This is probably the biggest bank blast that was ever exploded in a deep gravel mine on the Pacific coast or anywhere else. Piping commenced April 20. J. B. Hobson is manager.

The Anderson Lake mines, operated by the Anderson Lake M. & M. Co., in the Lillooet mining division, is being operated under W. E. Brett of Lillooet. A 5-stamp

mill on the property produced about \$2000 in bullion in April.

Nelson, May 30.

The Hayes copper mine, at Alberni, Vancouver Island, has been bought by Mackenzie & Mann of Montreal. Payment of \$50,000 on a total of \$600,000 will be made July 15, and payments of \$100,000 each every three months. A tramway from the mine to salt water will be built. The erection of a smelter is included in the plans of the new buyers.

On the west side of Wild Horse creek, near Fort Steele, is the Bald Mountain claim, now bonded by A. J. Alcock of Vancouver at \$25,000. The mine is owned by D. Griffith and the ore is free-milling gold quartz. H. Kershaw of Fort Steele is agent for the new owner.

It is reported that the Payne mine, near Sandon, has been closed down, and there is uncertainty as to when it will be reopened. The contract for the concentrator has been let.

J. L. Retallack and S. Norman have been examining the Washington mine, at Sandon, with a view to placing the control in the hands of the Northwestern D. Co., represented by the former.

The V. & M. Co., operating on Twelve-mile creek, has decided to put in machine drills, and negotiations for the machinery are under way. When the machinery is installed a large increase of men will be made. Manager Little states that his company will proceed with the survey of the V. & M. group, to get the property Crown-granted. The full returns from the smelter on the carload of ore recently sent to Trail netted the company \$43.60 per ton.

A consolidation of the War Eagle, Red Rock and Lulu claims in Phoenix is reported to have been made and the controlling interest sold to a London, Eng., company, to be known as the Sherbrooke Con., capital \$750,000, in \$5 shares. Operations will shortly be commenced. The War Eagle has a large outcrop of gold-copper ore. The mine is equipped with a steam plant. The development consists of a shaft sunk to a depth of 100 feet, with 600 feet of drifting and crosscutting.

The Payne M. Co., operating at Rossland, has decided to erect a new compressor and concentrator. It is expected that a change in the management will be effected shortly.

It is rumored that the Canadian Smelting Works of Trail, now the largest producers of lead bullion in Canada, will proceed immediately with the construction of a lead refinery. It has not yet been decided whether these works will be located in the Kootenay district or on the Pacific coast or at some point on the Atlantic seaboard.

J. Dorsey, manager of the Lake Shore & British Columbia M. Co., Ltd., says that the shaft on the Blue Bell, in Summit camp, is to be sunk an additional 100 feet. His mission East is to present to the shareholders a proposition to purchase a diamond drill outfit to exploit the J. S. and also the Mountain View claim. He also hopes to arrange for the installation of a seven-drill compressor plant on the Blue Bell.

J. Dorsey, representing the Lake Shore C. M. & D. Co. at Lardeau, has made a payment of \$4000 to Jarnel & Bower on a \$27,000 bond on the J. S. claim, in Summit camp.

The Kootenay-Tacoma Co. of Tacoma is preparing to begin work on the Last Chance group, on Quartz creek, near Nelson.

The Snowshoe Mines, Ltd., has been organized in London for the purpose of taking over and operating the Snowshoe group at Phoenix. The capital is £250,000. For the last two years this group has been operated by the British Columbia (Rossland and Slocan) Syndicate, Ltd., of which G. S. Waterlow of London is chairman and A. J. McMillan managing director.

H. H. Robinson of Chicago is doing development work on the Lenora, a copper-galena property located on Jumbo fork of Toby creek, near Peterborough.

Probably one of the best known mining properties in Lardeau district is the Badshot group, upon which considerable work has been done and a Crown grant issued. F. Johnson has sold his one-fourth interest in the Badshot group, Lardeau district, to J. T. Black of New Denver.

ECUADOR.

A. A. Blow, a mining engineer, says: "One of the remaining rich mining districts of the world will be open in two years, when the railroad reaches Quito. My private reports have informed me of the discovery of alluvial gold fields in an unexplored part of Ecuador. We have not yet located the original lodes from which the alluvial deposits have been washed. Our prospectors have located rich placer mines after a hasty exploration of a few of the streams which flow into the headwaters of the Amazon."

MEXICO.

The Greene Con. M. Co. at La Cananea, Sonora, has just paid a dividend of 2% upon the capital stock. The treasurer's statement says that the ore smelted ending April 30th was 9808 tons. The copper matte produced was 3,533,550 pounds, and the pure copper contents was 1,368,500 pounds.

The Candelaria Co., operating in the Parral mining district, Sonora, will build a fifty-ton cyanide plant to handle the tailings from the concentrating mill. A considerable portion of the values are lost under the present system. The concentrating plant also is being enlarged to treat the increased production. W. B. Storer, one of the owners, says the development being carried forward at present consists in sinking the shaft, now 100 feet, to 150 feet. At the latter depth a level will be run off and the ore shoots disclosed in the upper workings will be opened and exploited.

The Natividad M. Co., operating in Oaxaca, expects soon to put up another 10-stamp mill.

The Alma copper mines, near Carbo, Sonora, have been bought by A. Graves of Denver, Colo., and W. E. Lewis of Des Moines, Iowa, who have commenced work on them.

At the San Francisco mine, near Llano, Sonora, J. C. Underwood manager, a cyanide plant is under consideration to treat the accumulated tailings.

THE KLONDIKE.

Owing to a heavy snowfall, there will be a good head of water for sluicing. The prospects for an enormous clean-up are bright. The formerly stated estimates of \$25,000,000 to \$30,000,000 hold good.

Personal.

JOHN HAYS HAMMOND is in Denver, Colo.

MARK B. KERR of Grass Valley, Cal., is in San Francisco.

FELIX CHAPPELLET, JR., has returned from Mexico to San Francisco.

W. MILLER has been appointed Supt. Oriole quartz mine, Angels, Cal.

J. L. BRYSON has resigned as Supt. Yuba quartz mine, Maybert, Cal.

W. S. NOYES of San Francisco is in Mono county, Cal., examining mines at Castle Peak.

EDWARD BEHR has been appointed manager Golden Chest M. Co., at Murray, Idaho.

W. E. DOWNS, C. E., of Jackson, Amador county, Cal., is in San Francisco on a short visit.

M. L. SMITH, manager Roseburg gold mine, near Grizzly Flat, El Dorado county, Cal., is in San Francisco.

JAMES MCNAUGHTON has been appointed general manager Calumet & Hecla Co., at Houghton, Mich.

N. H. SCHEUER, formerly of Milwaukee, Wis., has accepted the position of Supt. Barnes mine, Gilpin, Colo.

C. E. WHITE, manager Nevada Copper Co., has returned from New York to the mines, near Lovelocks, Nev.

J. C. CHRISTENSON, Supt. Bradford quicksilver mine, Emmet, Cal., has gone on a six months' visit to Sweden.

ALFRED C. GARDE of Anaconda has been appointed general manager Payay silver mine, in Slocan district, B. C.

J. B. MILLER of French Corral, Cal., has been appointed Supt. San Francisco M. & T. Co., at Teller City, Alaska.

C. F. MERRY has been appointed general manager Montana M. & D. Co., recently organized at Spokane, Wash.

W. W. WAGGONER of Nevada City, Cal., has been appointed Debris Commissioner of California by Governor Gage.

A. A. BLOW, M. E., of New York, has taken a party of engineering assistants to Ecuador to examine a mining district near Quito.

E. C. ENGLEHARDT, late of Denver, Colo., has accepted the superintendency of the Middlemarch C. Co., at Middlemarch, Cochise county, Ariz.

J. E. TIBBITTS, M. E., field assistant to the State Mineralogist, will report on copper deposits in Humboldt, Mendocino, Lake and Sonoma counties.

L. CUMMINS, formerly at the La Mina Yaca, Sonora, Mexico, is now in charge of the cyanide plant of the Headlight mine, Carrville, Trinity county, Cal.

JOHN TREWEEK has returned to Salt Lake City, Utah, from France, where he has been in charge during the last year of a lead, silver and zinc mining company.

CHARLES E. AMES has been appointed by the California State Mineralogist assistant to his field assistant, F. M. Anderson, and has joined the latter in Shasta county,

Cal., to assist in the preliminary preparation for the promised bulletin on copper.

H. S. MONROE, Professor of Mining at Columbia University, New York, is inspecting the Boston & Montana and Butte & Boston copper mines at Butte, Mont.

F. J. FRENCH, general manager Blue Jacket Con. C. Co., of the Seven Devils country, Idaho, is in New York on business with the head office of his company.

CHAS. S. LONG, field assistant to the State Mineralogist, is investigating copper deposits in Placer, El Dorado, Amador, Calaveras, Tuolumne and Mariposa counties.

P. C. DUBOIS, M. E., field assistant to the State Mineralogist, is examining copper deposits in Modoc, Lassen, Plumas, Sierra, Butte, Tehama, Yuba and Nevada counties.

FRANK C. CALKINS of the University of California has ranked first in the recent examinations of University students for appointment as field assistants in the U. S. Geological Survey.

JOHN T. ALLEN, general manager Mexican G. & S. Recovery Co. of the City of Mexico, is visiting the Colorado-Ures mine, at Hermosillo, Sonora, Mexico, which is operated by the company.

Books Received.

"Petroleum Series—Bulletin No. 4, April, 1901—The Dutton, Rattlesnake, Arago, Oil Mountain and Powder River Oil Fields," by Prof. W. C. Knight and Prof. E. E. Slosson of the School of Mines, University of Wyoming, Laramie, Wyo., 57 pages of text and tables, with maps, is a carefully prepared, well expressed article on some of the possible petroleum fields of Wyoming. It comes in a good season, too, just as promoters are about to try to repeat in Wyoming the oil prospectus exploitation that California and Texas have suffered from. It would be well for every intending investor in Wyoming oil shares to read this bulletin first. It may not touch the field of their proposed investment, but will furnish facts regarding Wyoming petroleum possibilities that should not be disregarded.

"British Columbia" is the title of a pamphlet prepared by Richard McBride, Minister of Mines, Victoria, B. C., for free distribution at the Glasgow and Buffalo Expositions. It is an exceedingly well prepared volume, full of just the information that people would desire of the mines and mining of the Province, expressed clearly and briefly and without exaggeration or word padding. The illustrations are well chosen in subjects and superior in execution. The map of the Province accompanying the pamphlet should be revised. It is quite inaccurate and evidently carelessly compiled. Circulated at Glasgow, it would tend to inculcate unnecessarily false geographical ideas. On the map Skaguay, Haines, Pyramid, on the Lynn Canal, Ketchikan, on Revillagigedo Island, a number of smaller towns and a trifle of 10,000 square miles of Alaska are colored and marked just as if they were really part of British Columbia. The circulation from Buffalo of the carelessly prepared map is of little consequence. It will be overlooked or considered as a Canadian map maker's humor. But the Scotch are serious people.

Commercial Paragraphs.

THE Jeanesville Iron Works Co., Jeanesville, Pa., have taken an order from the Iron Silver mine at Leadville, Colo., for a compound condensing pump for 900 feet lift. They have just delivered one to the Vindicator Mines at Independence, Colo., for 1200 feet lift.

THE Ericsson Telephone Co. of 296 Broadway, New York, has issued in attractive form a reproduction of four interesting photographs of its foreign factories and of foreign exchanges using the telephones, one of the latter being in Shanghai, China, employing Chinese operatives. The reproduction will be mailed to telephone exchanges on request.

MESSRS. DEWEY, STRONG & Co., patent attorneys and solicitors, announce that they are prepared to handle business direct from either Washington or San Francisco. Mr. Geo. H. Strong, who has been the guiding head of the firm for over thirty years, has found it necessary, with the increase of business, to establish a fully equipped branch in Washington. This will also serve the interest of many inventors who feel that they live at too great a distance from the home office, and, in order to save time, prefer to communicate direct with Washington. Mr. T. Walter Fowler, who has been the Washington representative of the firm for many years, and is well known to numbers of the clients of the firm, assumes the management of the new office.

Latest Market Reports.

SAN FRANCISCO, June 6, 1901.

SILVER—Per oz., Troy: London, 27 7-16d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 50c San Francisco, 48c New York.

COPPER—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: \$69 6s 3d per ton.

LEAD—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 6½; pig, \$5.25. London, \$12 8s 9d per ton=2.70 cents per lb.

SPELTER—New York, \$4.20; St. Louis, \$3.75; London, \$16 2s 6d per ton = 3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY—New York, Cookson's, 10c; Hallett's, 8c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN—New York, pig, \$26.00; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 31c; bar tin, \$ 34½c.

QUICKSILVER—New York, \$61.00 large lots; London, \$9 2s 6d; San Francisco, local, \$47.00 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL—San Francisco, No. 1, 10c.

SOLDER—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS—F. o. b. New York 50@60c per lb.

ASSAY LITHARGE—San Francisco, 10c per lb, small lots.

BISMUTH—New York, \$ 2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 lb lots.

PLATINUM—San Francisco, crude, \$22 ½ oz.; New York, \$22 per Troy oz.
FERRO-MANGANESE—Pittsburg, 80%, domestic, \$62.50, large lots.
ALUMINUM—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.
TUNGSTEN—New York, \$ 5, 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL—New York, 50@60c per lb.

POWDER—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDES—Granite 6s, 16 oz., 40s., 10½c per set; 14 oz., 40s., 9½c.

CHEMICALS—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c per lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½ B, 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chloride of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3½@4c per lb.; Cal. s. soda, bbls., \$1.00; sds, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 88° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

COAL—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots,

Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

Catalogues Received.

The Jeffrey Manufacturing Co. of Columbus, O., have issued Circular No. 61, "Elevating and Conveying Machinery." It consists principally of illustrations of the many different devices applicable to the different classes of work required of such machinery.

The Robins Conveying Belt Co. of 15-21 Park Row, New York, have issued a pamphlet entitled "Coal Handling," handsomely illustrated with views of their system in operation, handling coal at breakers, washeries, power houses and under all the usual commercial conditions. They will mail the book on application.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FLOATING FISH TRAP—No. 675,045 May 28, 1901. R. B. Kittredge, San Francisco, Cal. The object of this invention is to provide a trap for catching fish in large quantities. It consists of a net having the upper edges provided with buoys or floats,

and the intermediate portion weighted to swing down to the bottom of the waterway; transverse connecting lines extending between the sides, and outwardly extending anchor lines by which the sides are maintained parallel and in the desired position. There is an opening near the inlet end and guides or leads by which fish are directed therein, and a closable gate in advance of the inlet to retain the fish in the net. The discharge end of the net has a convergent tapering covered portion.

EXCAVATOR—No. 675,046. May 28, 1901. Henry Lough, San Francisco, Cal. This invention is designed to provide a device for excavating either in dry soil or for dredging in river beds. It comprises a float or support, a tramway suspended therefrom having the upper arm extending in approximately straight lines, and the lower end curved into an arc of a circle. Cables support the outer end of the arc, a carriage is mounted upon rollers adapted to travel upon the tramway, a hinged swinging scoop suspended from the carriage with ropes and cables connecting the front and rear, guide pulleys over which they pass and winding drums so that the carriage and scoop may be caused to travel back and forward upon the tramway.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St. S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 28, 1901.

675,314—DUMB-BELL—F. B. Abenheim, S. F.	675,312—WOOD GRADING—B. W. Augustine, Alameda, Cal.
675,123—EXTRACTING GOLD—G. S. Bartholomew, School Angeles, Cal.	675,319—ROCK DRILL—W. S. Boyd, 3rd, Los Angeles, Cal.

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines OUR SPECIALTY.

—WE BUILD—

GOLD DREDGES Complete in
Running Order

to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

SEND FOR DREDGING CATALOGUE NO. 17.

—WE ALSO BUILD—

ALL KINDS OF

Mining, Milling, Concentrating,
Pumping, Air Compressing,
Hydraulic, Water Wheel,
and Hoisting Machinery.

Evans Hydraulic Gravel Elevators.

—We publish sixteen catalogues. Write for one in the line you are interested in.—

TANGENTIAL WATER WHEELS

MANUFACTURED BY

RISDON IRON WORKS,
SAN FRANCISCO, CALIFORNIA. ☐

We build Water Wheels for any head and for any power. Complete electrical power generator wheels a specialty. Large wheels up to 50 feet diameter for driving compressors.

SEND FOR CATALOGUE NO. 4.

“THE DANIEL BEST” 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,
16 TONS EACH,
or a total capacity of train,
48 TONS.

CAPACITY
OF
ENGINE,
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,
San Leandro, California.

ECONOMICAL ROOFING.

P. & B. Ready Roofing is not injured or affected by acids, smoke, fumes, steam, heat, moisture, cold, dampness, rain, or anything else, but time.

It will remain a good, strong, substantial roofing for a long number of years.

It's more easily applied and more easily transported than any other roofing and it is the most economical roofing it is possible to use.

The best builders demand P. & B. Roofing, for it's best for the buildings.

Manufacturers of Improved Appliances for Assayers.

DEALERS IN GENERAL LABORATORY SUPPLIES.

THE FULTON VARIABLE MOTION CONTINUOUS FLOW MINING PUMP.

Delivers a continuous stream with absolutely no water hammer so common with all other makes of pumps. Is particularly adapted to be driven by electric power, for the reason the resistance to motive power is almost uniform. I manufacture the FULTON PUMP in four sizes, ranging from 10 H. P. work to 50 H. P. work.

WRITE ME FULL PARTICULARS IN REGARD TO YOUR REQUIREMENTS.

The above cut is made from a photograph taken of a No. 3 FULTON PUMP at work on the 600 ft. level in the Tesla Mine at Tesla, Alameda Co., Cal.

Read what MR. O. NEWHOUSE, Consulting Engineer of the S. F. & S. J. Coal Co., has to say in regard to it.

OFFICE S. F. & S. J. COAL CO., TESLA, ALAMEDA CO., CAL., JULY 13, 1900.
Mr. A. T. Ames, Galt, Cal.—DEAR SIR: Replying to your favor of recent date, regarding the working of the Fulton Pump bought of you, will say: The pump is one of your No. 3 pumps, working in connection with a Fulton Double X, double plunger cylinder 5 in. diameter by 110 in. long; stroke of each plunger 2 ft. This pump is installed in our mine on the 600 ft. level, directly over our pump, and is forcing the water to the surface at one lift. We drive the pump with an electric motor, 30 H. P., direct connected to the pump with gear and pinion, and I am pleased to submit the following statement of duty:
Length of 6 in. column leading up incline to surface.....805 ft.
Perpendicular head.....640.83
Gauge pressure, actual.....275 lbs.
theoretical.....273.14
Barometer at pump.....29.58 in.
point of discharge.....23.95
Temperature air.....58 deg.
water.....76
To say that we are highly pleased with our pump expresses it very mildly.
Signed, O. NEWHOUSE, Consulting Engineer S. F. & S. J. Coal Co.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Joshua Hendy Machine Works,

Nos. 38 to 44 Fremont St., San Francisco, Cal.

THE JEANESVILLE Miners' Sinking Pump

HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so as to occupy as small a space as possible.

It can be operated in any desired position, either vertical or horizontal.

This pump is an improvement in many ways over other makes of sinking pumps.

The cap under the Plunger is fastened with Hinge Bolts, one bolt retaining the cap after the rest are released. Also providing Priming Valves in the Water Valve Chest Cover to prime the Lower Valves from Column Pipe, and they are so close as to be in no danger of breaking off.

We have thickened, and thereby strengthened, the wall of water passage leading from lower end of plunger. We have also strengthened the form, without adding materially to the weight of the connecting piece opposite the water passage. These have been weak points in other sinkers.

All parts commonly made of brass, such as water valve seats, valve stems, valve springs, etc., are made of Phosphor Bronze.

All parts are made to gauge, so that they can be easily renewed.

Parts for repairs will interchange with Cameron Sinkers of the same size.

MORAN FLEXIBLE JOINTS.

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil.

SMOOTH-ON IRON CEMENTS

For stopping leaks and pitting in MARINE BOILERS, for boiler patching, for repairing leaks or fractures in steam or hydraulic work, and for repairing blemishes in iron or steel castings. These cements are prepared in powdered form and applied by mixing with water. When hard they will withstand a red heat, steam, water, or oil, and expand and contract the same as iron. Write for illustrated catalogue and prices. When ordering state for what use.

THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/4 to 3 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

SOLAR HOUSE LIGHTS
 For houses not having gas or electric light service, and for those that have, but wish economy and independence.
 Costs **\$4.00** Per Light
EACH LIGHT LASTS A LIFETIME
 Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steady and richest light that is known.
 Write for particulars.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 30 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries. SEND FOR DESCRIPTIVE CIRCULAR.

Gold,	Copper,	Corundum,
Lead,	Chrome,	Antimony,
Zinc,	Nickel,	Cinnabar,
Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores.

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

ASSESSMENT NOTICES.

MOHICAN MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1901, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 300 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 14th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. CLASSEN, Secretary.

Office—300 California St., San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of May, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of July, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office—Room 801, Claus Spreckels Building, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of May, 1901, an assessment (No. 34) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of July, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 6th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 31, tenth floor, Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 23rd day of April, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Pon Wand.....	51	250	\$2 50
Pon Wand.....	55	250	2 50
Pon Wand.....	51	250	1 50
Pon Wand.....	87	500	5 00
Lu Chee.....	54	250	2 50
Jung Chee.....	57	250	2 50
George W. Warren.....	66	5,000	50 00

And in accordance with law, and an order from the Board of Directors, made on the 23rd day of April, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 307 Montgomery street, San Francisco, California, on MONDAY, the 17th day of June, 1901, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.
 " " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

An Old Mexican Stamp Mill.

With all the awakened mining activity of Mexico, and all the foreign advance of methods and appliances that it has received during the last twenty years, the country still presents instances of survivals of the "antigua" mining when Mexico lived within itself.

The illustrations on this page show one of the old stamp mills used for the crushing of gold and silver ores and the typical Mexican hacienda of Guadalupe y Calvo, where it is located.

It was erected over fifty years ago and is still running, whenever there is water enough to turn the great wheel, without a modification of the old picturesque construction. The belts are made of plaited strands of rawhide. Wooden pegs on the water wheel shaft act as cams and raise and drop the wooden-stemmed stamps. There are no screens to the battery—simply an overflow discharge. The mortar is made of wood. With the plant is a barrel for amalgamation, which can be seen next the water-wheel rim in the view of the mill building. This barrel is driven by means of a horizontal wooden wheel, having a number of short, vertical pegs, which interlock with other wooden pegs on the side rim of the water wheel.

The whole establishment is quite typical of the old Mexico, and it might be added of the old Mexicans. It is the production of a people to whom labor and time were capital, but whether work produced its end to-day or to-morrow mattered little, so long as it did in the end produce. The mill crushed slowly, but it crushed the ore and beat out the gold surely. It was enough for the Mexicans. Surely a machine construction which has withstood even Mexican wear and tear for a half century can not be called an uneconomical investment of the original capital.

Town of Guadalupe y Calvo, Mexico.

The Rosario mines, operated by the modern methods and capital, are at Guadalupe y Calvo, in comparable proximity to this old mill plant. But the Mexicans stay with the old mill and will doubtless be using it when the modern operation, now new, has

become a legend of Guadalupe y Calvo.

It is not generally known, but a similar mill was built by Mexican miners on a ledge at Forest Hill, Placer county, California, about thirty years ago. The ruins of it are still standing.

LATEST MARKET REPORTS.—278

MISCELLANEOUS.—Concentrates, 270. Leadville Pumping Practice, 271. The New Edison Storage Battery; Cyaniding Complex Gold Ores, 272. The New Hollow Hexagon Turret Lathe; Forest Endowment of Pacific Slope, 273. Mining and Metallurgical Patents, 274. New Patents; Notices of Recent Patents; Personal; Recently Declared Mining Dividends; Commercial Paragraphs, 278.

NEVADA STATE is at the present time attracting much attention as a field for mining investment. It is equally a good field for the prospector. Probably no other State has as large an area of unexplored country of mineral-bearing possibilities. The recent discoveries at Reno show how easy it is not to see a mine when handicapped with a conviction that there is no mine. Tonopah, which now has, it is said, a full half thousand of population, eight months ago was not even a name on the map, and had no population at all. On the eastern boundary the enterprising miners of Utah have been prospecting westward and finding promising mines all along the line between the two States. There is no reason why the same close prospecting that Idaho, Utah and Arizona are having should not produce equally substantial results when extended over Nevada.

From telegraphic reports it would appear that the Pennsylvania Railroad Co. has bought the Pennsylvania Steel Co. Aside from the individual magnitude of the transaction, if correctly reported, it is very suggestive. The largest customers of the large industrial combinations recently formed are other large industrial combinations. The principal customers of the steel manufacturing combination are the railroads. Evidently the action of the Pennsylvania Railroad Co. has been directed to secure to itself the profit of an economy that the steel manufacturing combination expected. The Pennsylvania Railroad proposes to manufacture its own rails and the steel for its bridges and buildings. The action exposes the weak place in the theory of gains to be made by combination. The customer may revert to original conditions and perform for himself the service the anticipated profit of which has been capitalized by the combination and sold—to foreign investors. Take the business of steel manufacture for example. It costs to make steel in the United States \$12.50 a ton. The profit the steel is made to earn in the largest combination of the trade yet made is said to be about \$18 a ton. That is, it is said that it must make this to pay the fixed interest and anticipated dividend charges. The average cost of transportation to the point of use within the United States of the manufactured steel is \$10 per ton. The consumer thus is made to pay \$12.50 a ton costs of manufacture of the steel and about \$28 a ton waste. With a use for say 50,000 tons of steel a consumer can economize an aggregate waste of \$1,400,000 by building his own steel manufacturing plant at the point he wants the steel. It is not intended to imply that the consumer can make steel for \$12.50 a ton; but that the possible economy is large enough to pay a larger cost and build the plant.

The Mining Congress in July.

The Mining Congress at Boise, Mont., will have read before it some able and instructive papers on mineral resources and mining of several States and Territories. But, desirable and useful as these essays and literary documents will undoubtedly be in their special field, their presentation should not put in the background the real business for which the Congress has the right of existence. The essays can be printed. Indeed, if they are in matter what their titles call for, they must be printed in order that they shall receive the consideration which is their due after the Congress has adjourned.

The statement of the objects of the meeting of the Congress, as formulated in the call, is very general. It is too general to be worked down into identical, concrete detailed lines of proposed action by the scattered individual members before the date of meeting. Three days of meeting, with the interest of the members scattering in a whirl of social entertainment, in the consideration of essays, in the examination of mineral exhibits, and in the routine business of organization of the meeting and provision for its successor a year hence, will leave little time for that working down of glittering generalizations into detailed, definite policies.

Something more is wanted than resolutions. That something is results. To this paper the part of the Congress in the scheme of the mining industry of the nation—for it is national, rather than international, even though so named—is political. It should be the initiative and referendum of legislation relating to the mining industry. It should know what the industry as a whole wants in its relation to all the other industries of the nation. It should say what it wants clearly and with an emphasis that will command both attention and action. It should consider ways and means of getting what it says it wants. It should proceed to get what it says it wants by using the ways and the means, which in political matters are men and the combined power of their common business interests.

The mining industry very much wants what this paper proposed years ago—a Cabinet officer, a Secretary of Mines. It would seem as if the industrial changes of the last year had brought it within reach. When wheat, corn, cotton and cattle were the great export staples, the business interests producing, manufacturing and exchanging them were able to get a Secretary of Agriculture. Now iron, steel, copper and coal are fast becoming great export staples, and the strongest financial and commercial business interests of the nation are far more closely identified with the mining industry than they are with the agricultural. Mining is no longer a local business in the Territories and in a few States. A majority of the States are now interested in mines and in mining. The industry has vast wealth and many votes. The wealth and the votes should be able to command a Cabinet representative.

The mining industry wants badly a revision of the present general statutes and a codification into other statutes of the essence of many judicial declarations. While it wants all this, it can possibly best get some of it by formulating a few of the most necessary changes. It can ask the change of the law of location, so as to do away with extralateral rights. It can propose a change in the issuance of patents to public lands, so that the minerals beneath the surface shall remain open to exploitation independent of the patent to the surface for other purposes. This is the Mexican law and it works exceedingly well in practice there. In operation in this country, such questions of title as have come up at Leadville, Colo., cannot arise. The getting of patents will be simplified and the existing premium for successful dishonesty in patenting land will be removed. The mining industry in Alaska wants the abolition of the special legislation, the vicious operation of which has resulted so injuriously to its development. The mining industry wants none of the same kind in the Philippines.

What has been here suggested is constructive legislation. Not alone will its enactment be advantageous to the mining industry, but it is in the line of an enlightened public policy. It is the lesson of the successful industrial reorganization of a part applied to the whole. Just as industrial reorganization has

been predicated on the elimination of wastes and the inauguration of enlightened economies, so will what is here suggested, when accomplished, eliminate wastes and promote enlightened economies. It will eliminate the waste of litigation over extralateral rights, for there will be none to litigate over. It will eliminate the waste of legal procedure in getting titles, necessitated to prevent fraud, by removing the incentive to its commission. It will make an enlightened economy by eliminating some of the parasitic public officials who now lawfully mine the miner's pocket.

These suggestions of potential possibilities in results from the Mining Congress are made in the hope that they may receive the consideration of members in advance of the meeting, and with the wish that they should receive from the press the thoughtful discussion that their importance merits.

Then, when the Congress meets, the members should waive the opportunity to do little businesses with each other and concentrate on the big business for the gain of all. The United States is going now into a world-dominating contest for the control of the markets for metals just as it has already successfully gone for the control of the food supplies. Let the members of the Mining Congress so act as to clear the field of action of what are clearly nothing but hindrances to success. The place for the mineral specimen exhibits is Buffalo. The place for the essays and literary documents is in books. The brass bands and bouquets of resolutions are for celebrations. The Congress is simply a machine to get concrete results in political legislative actions which will make more profit to all engaged in the industry without taking it from each other.

A COMPLETE CENSUS OF ALASKA at this time would show a white population of citizens of the States and the United States of not less than 30,000. This population may fairly be considered permanent. The natural resources and establishment of industrial occupation have brought the people of the country into business and social relations in no ways markedly different from the business and social relations of the communities from which they came. While there are excuses to answer for the different governmental relation of the Alaska people when the population was small and transient, there is no reason for the existence of the difference now, and there should be no excuse. Alaska people should not be subject to unnecessary official or indirect governmental spoliation. Not ruling themselves, and without officials directly responsible to them, this is bound to continue. Most of it is petty in character, consisting of fees and charges paid officials for which they do not have to account, and in the maintenance of public offices at points not convenient to established centers of population and routes of travel. Congress in making legislation to protect creditors in Alaska provided that statements of individuals or companies doing business in Alaska must be filed annually with the Secretary of the District and with the clerk of the District Court. It did not provide any filing fee. The Secretary of Alaska has thereupon established a filing fee of \$10, which he collects as a personal perquisite. The service of filing does not cost any labor but indexing, and not necessarily even that. The fees for recording mining locations and other papers are fixed in sums double and more than the service costs. The Government maintains the office of the Surveyor General at Sitka, necessitating not less than \$100 of indirect cost to every mine patent application, which could be avoided by locating the office at Juneau. The cost of moving the office to Juneau is a trifle compared to the public convenience and economy effected. Congress should do it. The Territory should have an additional measure of self-government sufficient to enable it to protect itself from the petty fee exactions of officials. All of these bear proportionally harder on the prospecting mining than on any producing industry. They are a tax on capital which the capital is not earning and may never earn.

THE recent order for the conversion of all of the Southern Pacific engines into oil burners will, when completed, consume annually a quantity of petroleum equal to the present entire annual production of California. The present low sale price of oil should not stop the drilling of new wells. The market will be able to consume the product.

Concentrates.

STEEL is divided into four general classes—converted or cemented steel, crucible cast steel, Bessemer (acid or basic) cast steel and open hearth steel.

THE petroleum-bearing rocks in Colorado are sandstones and shales of Mesozoic age, and principally of the upper division of it, the Cretaceous period.

ALL plan drawings should have marked on them all the dimensions that are necessary for the use of the plan. It should not be necessary to scale the plan to ascertain them.

THE U. S. Supreme Court has ruled that the clause of the Constitution providing that private property may not be taken without just compensation means that compensation in money must be rendered.

TO DRILL a chilled casting, heat the casting and put a little sulphur on the spot it is desired to drill and permit it to cool. Harden the drill and draw no temper, using equal quantities of alcohol and turpentine.

A RECENT INVENTION is a process by which paper is worked into thread by spinning and into many fabrics by weaving. Another novel manufacture is an ax made of paper with a hard, fine edge that stands use in cutting.

NOTES kept on resurfacing a macadam road that was considerably worn, the material being a hard limestone, showed a cost of 3.3 cents per square yard. At this rate for a 16-foot roadway the cost would be about \$300 a mile.

A SUCCESSFUL CONTRACT BID of 20 cents a cubic yard for dredging for the United States Government is inconsistent with an actual payment of 12 cents a cubic yard for dredging in the same ground for a private corporation.

THE thickness of the tinfoil in common use runs upward from a minimum of a half thousandth of an inch. It is made by rolling instead of beating. It is not necessarily pure tin, but is usually a center layer of lead covered with the tin, the two metals being first welded together.

THE cost of mountain road construction, side-hill grades in a timbered and rock country, varies from \$600 to \$2000 a mile, dependent on the hardness of the rock and the steepness of the slope. The lower figure is for shelly slate rock that can be picked on hill slopes from 5° to 20°.

THE Canadian Minister of the Interior has finally confirmed the title to the locators of locations made on Dominion creek, in the Klondike, before the reservation of alternate claims was made for the Crown. The ground of the decision was the priority of the locations to the date of the reservation.

NAILS AND TACKS are now made from an aluminum alloy that does not corrode or deteriorate in the atmosphere. They are desirable as a substitute for copper nails and tacks on roofs and tank fastenings. Taking difference of weight into account, they are about 4 cents a pound cheaper than copper nails and tacks.

IN the Cowper-Coles process for aluminum welding no solder is used and the process is not electrical. It is claimed that cast aluminum welded by this process is tougher and stronger at the weld than elsewhere. The apparatus used is stated to be simple and applicable to any section of metal, and the weld is made without hammering.

RECORDS kept of the work done by compressed air tools in twenty classes of work of a large railroad machine shop, and comparisons made with the records of similar work done by the old-style hand labor show that the use of the compressed air tools effected an average saving in the cost of the work of 70% and in the time employed of 72%.

A CERTAIN amount of roughness in the surface of steel, such as is left after cleaning by a sand blast, is desirable where the steel is to be painted. There is practically no absorption of paint into the body of the steel, so that the adhesion is wholly restricted to the surface. The irregularities of the rough surface provide a better adhesion than a perfectly smooth surface would.

A CAST STONE CONSTRUCTION for buildings has been introduced and applied at Baldwin, Michigan, on a group of manufacturing buildings covering seventeen acres. The walls have inside and outside sheathing of "cast-stone" blocks, with interlocking joints, so formed as to be solidly united with the concrete monolith deposited to form the base of the walls. The blocks are hollow, closely imitate stone and can be made damp-proof and frost-proof.

IN Washoe county, Nevada, since 1876, there have been made and recorded 7327 mining locations. A very large but unknown number represent relocations. By far the greater number were locations of gold and silver claims. Of the remainder 213 are for borax claims, 79 for copper, 37 for coal, 13 for quicksilver, 13 for gypsum and 2 for antimony. Peavine district is credited with 1697, Washoe 1510, Pyramid 931, White House 736, Wedekind or Bryan City 200. The remainder in smaller numbers are scattered in many minor districts.

BLUE PRINTS AND PAPER DRAWINGS generally can be waterproofed by the use of refined paraffine. Saturate in melted paraffine pieces of absorbent cloth and cool. These can be used at any time subsequently. Spread a piece of the cloth on a smooth surface, superimpose on it

the blue print drawing, and on top of this a second sheet of the cloth. Iron with a moderately hot iron. The paper will absorb paraffine from the cloths till saturated, more paraffine being put under the iron till thus effected. By the process the lines in the drawing are brought out and intensified. The paper is not shrunk or distorted and becomes translucent and waterproof.

THE principal industrial use of black oxide of manganese is in the manufacture of ferro-manganese for subsequent use in steel making. Some small amount is employed in chemical manufacture. The Illinois Steel Co. at Chicago are buyers of manganese ores from Leadville, Colo., and the Carnegie Co., at Pittsburgh, Pa., are even larger buyers, principally of ore from foreign mines. The price is low, as it is not a rare mineral. It is sold by units, and, if of the best grade and free from phosphorus, brings from \$12 to \$15 a ton at the point of delivery.

IN brazing, the two parts to be joined are beveled so that where the joint is made there is no increase of thickness of metal. Cleaning is completed by acid, a piece of solder is placed between the parts, and heat applied to fuse the solder quickly and at the same time fuse the faces to be joined so that there is an entry of the solder into the body of the metal. Cooling should not be too rapid, as the joining would thus become hard and brittle and fail to stand the wear of use. On the other hand, if cooled too slowly the joint would have a soft spot and be liable to give out from that cause.

A TUNNEL location is limited to unappropriated public land in the right of appropriation of blind ledges discovered by it. That is to say, if there are prior valid lode locations in the line of the tunnel, any blind ledges apexing within the vertical planes of their side or end lines are part of the claim location and cannot be acquired under a tunnel location even if the actual discovery is made in the latter outside of those vertical planes. The tunnel cannot under the United States statutes cross the planes of the boundary lines of the location in search of ledges, though it has the right to follow and mine within the vertical planes, ledges discovered and apexing without those planes.

WASTE and economy in the business of mining depends on the point of interest of the individual. Broadly stated waste is any value out of the mine that other individuals get, and economy consists in keeping the values of the mine that other individuals get down to the smallest unavoidable amount. Wastes are of two kinds, unavoidable and avoidable. Unavoidable wastes are bare costs of necessary labor and service. Avoidable wastes are the profits of other individuals than the one who occupies the point of individual interest. Economy consists in preventing avoidable wastes by keeping other individuals from getting profits. From the point of view of the mine operator, the individual who carries the initial and greater risk of the business, the profits the custom smelter or millman, the railroad, and the selling agents make out of the values taken from his mine, are wastes. Economy from his point of interest consists in getting these profits himself—which he can do by himself performing their services. From the point of view of the smelter man and the railroad transporter and the selling agent in combination, waste is the profit the miner makes. Economy is taking it away from him and dividing it among themselves. If the three are not combined, business consists in getting the largest share of the profits of the mine.

THERE will be no regular programme prepared for the meeting of the International Mining Congress at Boise in July except for the first day. The congress itself will prepare the programme for the subsequent days. The following will be present and by special invitation will present papers on the subjects named: Hon. J. Hutchinson, Silver City, "Mining in Idaho;" Prof. S. W. McCalla, Atlanta, Ga., "Mineral Resources of Georgia;" Prof. N. H. Winchell, Minnesota, "Geology of Minnesota;" Mr. E. Sloan, South Carolina, "Geology of South Carolina;" Prof. E. A. Babcock, North Dakota, "Geology and Mineralogy in an Educational System;" Dr. J. Talmage, Salt Lake City, "Geology of Utah;" Mrs. Mary Arkwright Hutton, Wallace, Idaho, "Some of the Ethical Aspects of Mining;" Prof. Samuel Calvin, Iowa, "Geology of Iowa;" Prof. J. A. Holmes, North Carolina, "Geology of North Carolina;" Prof. J. C. Smock, New Jersey, "Geology of New Jersey;" Prof. E. W. Hall, Minnesota, "Iron Zone of Minnesota;" F. C. Semmic, Duluth, "Mining as a Business Compared With Commercial and Manufacturing Enterprises;" Dr. G. D. Loderback, Nevada, "Geology of Nevada;" Hon. A. P. Swineford, Alaska, "Alaska—Its Climate, Resources, Etc.;" Hon. W. B. Hayburn, Idaho, "Revision of Our Mining Laws."

IF the railroad land is patented, the title is good for any mines there may be on the land. Such a patent can not be questioned, except for fraud in obtaining it. Only the Attorney-General of the United States can bring an action to cancel a patent based on fraud. The patent itself is presumptive evidence that there has been no fraud. On patented railroad grant land there may be mines, but there cannot be mining claims, as they are defined by the Revised Statutes of the United States. The mining claim is, strictly speaking, a grant of right to possession of and use of a tract of unpatented public land under compliance with certain conditions, one of which is assessment work. On patented land the mining claim ceases to exist as such, and with its termination of existence goes the necessity of compliance with the conditions

provided for the possession and use of mining claims. Assessment work is not required on mines on patented land, no matter what kind of a land patent it is. If well known mineral land is in sections designated as a railroad grant, at the time of the vesting of the title of the grant, the well-known mineral land is excluded from the grant and never in fact becomes part of it. On such land assessment work must be done on mining claims. If the land was not well known mineral land at the time of the vesting of the grant, but subsequently becomes well known mineral land before what is known as "listing" for issuance of patent to the railroad, the land may, or may not, revert to the public land and become open to the location of mineral claims. It depends on the construction the courts have given to the particular grant. Generally, mining claims are located, and on such development work must be done until patent issues.

THE committee of the American Society of Mechanical Engineers who have been considering the codification and standardization of the methods of making engine tests have in their preliminary report recommended the number of heat units consumed per hour per indicated horse power and per brake horse power as the standards of comparison. This is not intended to do away entirely with the common existing terms of expressing comparative efficiency of engines, which are recognized as useful within their limitations, but to have a common final standard test based on the actual thing all engine operation depends on, heat. The heat consumption of a steam engine required for the standard test is ascertained by measuring the quantity of steam consumed calculating the total heat of evaporation of the entire quantity, and crediting this total with that portion of the heat rejected by the engine, which is utilized and returned to the boiler. The term "engine" as here used shall include the entire equipment which is concerned in the production of the power, embracing the main cylinder or cylinders, the jackets and reheaters, the air, circulating and boiler feed pumps, if steam driven, and any steam driven mechanism necessary to the working of the engine. The heat consumption of gas, oil or other engines of the internal combustion class is found by ascertaining the total heat of combustion of the particular fuel used, which should be determined by a calorimeter test, and multiplying the result by the quantity of fuel consumed. The I. H. P. for the proposed standard is obtained by the use of steam engine indicators. It should be confined to the power developed in the main cylinder or cylinders, and should not include that developed in the cylinders of auxiliaries. The committee have recommended as a subsidiary form the basing of efficiency on a "standard coal" unit, which is a coal giving to the steam 10,000 British thermal units for each pound of dry coal consumed.

PLACER GOLD is not, as a general rule, found very distant from its original place of lode or rock deposit. The hardness of the lode rock, fineness of the particles of gold, and the relative hardness of the lode-enclosing rocks compared with the country rock down stream are conditions which exert more or less influence on the distance of the deposit from its source in the rocks in place. Very fine particles of gold will float, particularly if in thin scale; also such rock fragments as contain fine particles of gold will be moved farther from the place from which broken out from a lode than pieces of rock containing coarse gold. Gold in honeycombed quartz or oxidized iron-bearing quartz is very generally freed from the quartz before being moved far from its original place; as a matter of fact, much of it is completely broken up, freeing the gold in place, to accumulate and form a pocket right on top of the large outcrop or immediately below it. The soft country rocks, by wearing down under erosion more rapidly than the relatively harder rock, by limitation up and down stream, are evidenced by successive parallel cutting, and, in the comparatively broad level stretches thus formed, furnish places for long-continued deposit of gold-containing rocks, which there become broken up and deposit their content of gold when they themselves in smaller fragments are pushed onward down stream. In the harder rocks the cutting is continuous in practically one line, so that no places of accumulation of gold-containing rocks are made, and there are comparatively small accumulations. In the California mountains the streams cut through successive bands of gold-containing rocks, so that distribution of deposits of placer gold were formed over long-continuous channel distances, as compared with many other districts. Normally, 5 miles from the upper limit or lode source to the lower limit beyond which there is gold, but insufficient in quantity to be payable, is about the limit. Above the lode source there is, of course, nothing. Below the workable placer there is a long down-stream distance in which there is gold, widely distributed in traces that are apt to be misleading. These fine colors and general prospects are due to the widely distributed fine gold that is more or less floatable either by itself or as fine particles in fragments of lode rocks. These particles are, if anything, more likely to be plentiful near the top of a deposit, rather than at the bedrock or bottom. The value of the bedrock deposit cannot be correctly estimated from this light gold of the top wash. It is only safe to estimate from prospecting of the entire depth. Generally a gradation downward of the size of the particles can be observed beginning at the lode source. Coarse gold is very generally found close to the original lode source, very fine light gold at a considerable distance from it. Generalizations as to probable quantity in a deposit are unsafe without considerable prospecting covering a comparatively large area.

Leadville Pumping Practice.

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

One of the most salient features of the Leadville district, from the miner's point of view, is the large volume of water to be handled. Not only are the mining operations made more expensive on this account, but it causes prospecting to be more difficult and hazardous. So far as prospecting is concerned, it must be remembered that the Leadville deposits are "blind" and that it is necessary to sink for 500 to 1000 feet to reach the probable ore contacts. During the sinking operations immense flows of water may be encountered and progress will be slow and expensive; finally all this expense may be in vain inasmuch as the "contact" may be barren or even non-existent in the territory controlled by the prospectors. Any one experienced in sinking wet shafts will readily understand why, under these circumstances, such sums as \$50,000 to \$100,000 have to be expended in doing mere development work.

In the entire Leadville district 15,000,000 gallons of water are pumped per twenty-four hours, or 63,000 tons. The amount of ore raised is about 2200 tons per twenty-four hours; the ratio of water to ore raised is therefore 28½ to 1. From a careful estimate of the average cost of pumping it seems that it costs 4 cents per ton to raise water or a charge of \$1.14 against every ton of ore mined. The produc-

tion of the camp was 818,000 tons for the year 1900; the pumping charge, therefore, against the production was \$932,000. The value of the camp's product for the same period was estimated at \$12,900,000, so that practically 7½% of the production went to pay pumping expenses.

It will be understood that these charges include both productive and unproductive mines. In the best equipped producing and pumping mines the cost of pumping will vary from 30 cents to 75 cents per ton of ore raised, varying according to volume of water handled, depth of mine and output of ore.

It will be readily understood from these facts why the water question in Leadville is such a serious one and why "bucking water"—to use the elegant local phrase—looms so large in the reports of prospecting companies. The problem is such a serious one that a great deal of attention has to be given to it, in order to keep the expenses down to a reasonable limit. It can hardly be doubted, therefore, that under these conditions many interesting facts can be obtained from a study of the pumping practice of Leadville. Moreover the camp has been worked for over twenty-two years so that a definite practice has been evolved from the failures and successes of the past.

One feature of mining in Leadville, however, has to be given full weight in considering the mining methods, and that is the conditions of tenure of property. With few exceptions the Leadville mines are worked by lessees and sub-lessees, some of whom are working miners, others syndicates or leasing companies. Until recently leases were short and the operation of the mines was governed entirely by the life of the lease and not of the mine. Leases are now granted for long terms, ten years in some cases, and a decided improvement in the mining methods is the result.

Another feature must be considered. So far as at present known the maximum depth, at which these

mines are to be worked, is 1400 feet and in the great majority of cases 1000 feet is the working limit. Under these circumstances enormous surface equipments are not required in Leadville; however, owing to the large volume of water to be handled, very large pumps must be used.

In the last few years some very fine pumping machinery has been installed in the district; they are all of the direct-acting type with outside packed plungers. All the best known makers are represented. Sinkers are generally of the Cameron, Snow or Knowles make. Station pumps are compound or triple expansion condensing of the Jeanesville, Knowles, Worthington, Prescott, etc., make. No electric, Cornish or rotative pumps are in use. Nor are any of the pumps operated by compressed air.

All working mines are well equipped with pumps: A typical outfit consisting of from three to five sinking pumps of a capacity of 300 gallons each against a maximum lift of 600 feet; two or more station pumps, one of which is capable of handling the normal flow and the others acting as reserves in case of breakdowns or sudden rushes of water.

SINKING PUMPS.—The Cameron and Snow sinkers appear to be the favorite pumps of this class. Slip joints are used in both steam and water columns and are of sufficient length to allow of the insertion of a full length of pipe between pump and columns. Whilst unwatering an old mine or sinking a wet shaft the sinkers are frequently run far above the rated capacity. The severe shocks and grit try the quality of the very best pumps so that frequent

breakdowns occur. The number of sinkers used is such that one or more, in a perfect state of repair, may always be in reserve. Where the water flow is heavy and the depth great it is usually found necessary to relieve the sinkers by cutting temporary stations for tank and station pump; this principle may be extended far more than is customary, as it will be found cheaper and more rapid in the long run.

320 boiler H. P. will be required, or, say, three 125 H. P. boilers. This accounts for the large number of boilers seen at the Leadville mines, half of which may not be in use; they have, however, either been in use operating sinkers, or it is anticipated that a sudden rush of water may necessitate their use at any time. In "bucking water" it is not merely a question of pump capacity, but also boiler capacity. The typical sinker has 14-inch steam cylinder, 13-inch stroke, 7-inch plunger, 2½-inch steam pipe and 5-inch suction, and makes normally 100 strokes per minute.

MAIN OR STATION PUMPS.—All main pumps are of the direct-acting, reciprocating type, driven by steam. The Cornish type is quite obsolete, and from the wrecks of such pumps that may be seen scattered over the hills it is certain that their design and construction was crude in the extreme. This accounts, no doubt, for the total disappearance of the Cornish pump from actual operation. Still, the direct-acting pump is so well adapted to handle variable flows of water, its capacity can be so readily increased, its efficiency is so high, the maintenance and repair charges are so small, the room taken up in the shaft is small, and, above all, the interest on first cost and the depreciation is much less than when using the Cornish pump, that it is practically certain that the Cornish pump has disappeared forever in the West.

The Leadville station pumps are invariably of the condensing type, thus not only taking care of the exhaust steam, but also increasing the steam economy. The steam end is generally compounded, but most of the large pumps recently installed are triple expansion. The boiler pressure usually carried—eighty pounds—is not adapted to triple-expansion engines. The Wolfstone triple expansion uses steam at 140 pounds boiler pressure. The steam cylinders of most pumps are steam jacketed. It is worthy of remark that no rotative pumps, such as the Riedler or Dickson, have been tried in Leadville, nor are there any electric or hydraulic pumps. No pumps are actuated by compressed air. Practically speaking, the Leadville pumping practice is quite uniform throughout the district. This remark may be applied to all the Leadville mining operations: the uniformity is remarkable and in sharp contrast to other districts.

The pumps are installed in well-timbered stations, which are usually of fair size. Many stations are, however, far too small; but the tendency is to cut them of larger floor dimensions, so that ample room is available when making repairs. Such repairs, as a rule, have to be made quickly, and the desirability of having plenty of room is obvious. The Penrose shaft has a station which is a model in this respect. The stations are not equipped with overhead crawls for handling heavy pieces, as in the Montana pump stations and in the stamp mill. The station tanks, or sumps, are usually of great size, and whenever the stations are at the bottom of the shaft it is customary to increase the holding capacity by driving levels. In addition to this, at

the Ibex, the pump station is raised 6 or 8 feet above the floor of the drifts. Many stations are lit with electric light; many by evil-smelling lamps. Some talk is being made of lighting with acetylene gas, which is admirably adapted to such work, being cheaper than oil and giving much better illumination than electric light. It is also very cheaply put in; a plant for one station should not cost more than \$50 to \$60 complete. The lesson does not yet seem to have been thoroughly learned that to keep machinery in anything like first-class shape plenty of light is essential. Few pumps have float attachments between sump and throttle so that the pump speed may be automatically controlled by the amount of water flowing into the sump.

The stations are cut usually on the narrow end of the shaft, so as to interfere as little as possible with the movement of ore and waste. The timbers usually put in are 14"x14" or 16"x16", the roof being supplied in most cases by long caps. The Ibex and Greenback stations, however, have arched roofs, which is certainly better construction. The following details have been compiled of the characteristic large duplex station pumps, average lift 1000 feet:

MINE.	Steam cy's, inches.	Stroke, inches.	Plunger, inches.	Steam pipe, inches.	Water column, inches.	Maker.	Size of station, feet.
Ibex.....	15 & 28	38	7½	6	13	Jeanesville	18 x 70x10½
Wolfstone....	18, 28 & 42	36	10	6	10	Knowles	16½ x 48x10½
Greenback....	15, 23 & 39	24	9½	6	10	Prescott	
Rialto.....	19 & 36	36	9	6	10	Jeanesville	16 x 65x13

The steam pipes leading down the shaft are thoroughly well protected. The Ibex steam pipe is about 3000 feet in length from boilers to pump. The out-

Jeanesville Station Pump, Leadville, Colorado, Mines.

side pipe is covered with 1 inch magnesia covering, then boxed and filled in with sawdust, making a very good protection. The pipe going down the shaft is protected with $\frac{1}{2}$ -inch asbestos paper, $\frac{1}{4}$ -inch felt and two wraps paper. This is then completely armored with galvanized iron pipe, each joint being soldered. This protection keeps the felt quite dry, thus assisting in preventing radiation. The radiation loss is not at all excessive.

Every pump is provided with a counter to record the number of strokes made. The condensers are invariably jet condensers. A vacuum of 18 $\frac{1}{2}$ inches is held at the Wolfstone pump, which has an elevation of about 9700 feet above sea level; the theoretical vacuum is 20 $\frac{1}{2}$ inches.

At station pumps the pumpmen work twelve hours and receive \$4; at sinkers the pump men work eight hours and receive \$4 per shift.

The New Edison Storage Battery.*

It is well known that the history of the storage cell is essentially that of the lead cell discovered by Plante in 1860, in which lead peroxide is the depolarizing substance. An enormous amount of labor has, in the aggregate, been expended upon the improvement of this cell in the hands of experimentalists. As a result of that labor, the storage battery has at last become a recognized adjunct to the direct-current central stations, but it has limitations that seem to withstand further attempts toward improvement. Of recent years, hardly any success has been met with in the direction of reducing its weight for a given energy storage capacity, without detriment to endurance, and this weight is the great drawback of the storage battery in electric storage traction, and has been the principal obstacle to its advance in this direction for the past twenty years.

In practice, the storage energy per unit mass of the modern lead battery is from four to six watt-hours per pound of battery (8.8 to 13.23 watt hours per kilogramme). Expressed in another way, a battery weighs 124.5 to 186.5 pounds per H. P. hour at its terminals (75.5 to 113.4 kilos per kilowatt hour); or, if its stored energy available at terminals were all expended in gravitational work, a battery could raise its own weight through a vertical distance of from 2 to 3 miles (3.2 to 4.8 kilometers).

While it is possible to increase the energy per unit mass by making the electrodes very light, yet this is always found to be followed by a very heavy deterioration.

Many attempts have also been made to perfect storage cells of the alkaline-zincate type, but the great difficulty of depositing zinc in coherent form from the solution, as well as the lack of a depolarizer that shall be insoluble in the electrolyte, has stood in the way of this cell's success.

Mr. Edison set himself the task of finding a cell which should possess the following advantages:

1. Absence of deterioration by work.
2. Large storage capacity per unit of mass.
3. Capability of being rapidly charged and discharged.
4. Capability of withstanding careless treatment.
5. Inexpensiveness.

He believes that the cell here described may claim these advantages in a very satisfactory degree.

The negative pole or positive element, corresponding to the zinc of a primary cell or the spongy lead of a secondary cell, is iron. The positive pole or negative element, corresponding to the carbon of a primary cell or lead peroxide of a secondary cell, is a superoxide of nickel believed to have the formula NiO_2 . The cell is therefore a nickel-iron cell, a name which suggests the structural material—nickel-steel. The electrolyte is potash; viz., an aqueous solution containing from 10% to 40% by weight, but preferably 20% of potassium hydroxide, the freezing temperature of which is 20° below zero Fahrenheit—or 30° centigrade.

The initial voltage of discharge after recent charge is 1.5 volts. The mean voltage of full discharge is approximately 1.1 volts. The normal discharging current rate per unit area of active element (positive or negative) is 60 $\frac{\text{milliamperes}}{\text{sq. inch}}$, or 8.64 $\frac{\text{amperes}}{\text{sq. foot}}$, or 0.93 $\frac{\text{amperes}}{\text{sq. decimeter}}$. The storage capacity of the cell per unit of total mass of the cell is 14 watt hours per pound or 30.85 watt hours per kilo.

Expressing the same statement in another way, the weight of battery per unit of electric energy at terminals is 53.3 pounds per electrical H. P. hour or 32.4 kilos per kilowatt hour. Or the battery gives energy at its terminals sufficient to lift its own weight through a vertical distance of approximately 7 miles or 11.26 kilometers. The mean normal discharging power rate per unit mass of total cell is 4 watts per pound or 8.82 watts per kilo: corresponding to a normal discharge period of three and one-half hours. The cell may, however, be discharged at a relatively high rate, in approximately one hour: corresponding to a discharging power rate per unit of total cell mass of 12 watts per pound or 24.46 watts per kilo. Charging and discharging rates are alike. That is

to say, the cell may be charged at the normal rate in three and one-half hours; or, it may be charged at a relatively high rate in one hour, with no apparent detriment beyond a somewhat lowered electrical charge efficiency. In other words, the cell does not appear to be injured by over-charging or discharging, and only suffers in electrical efficiency under such treatment.

The positive and negative plates are mechanically alike, and can scarcely be distinguished by the eye. They differ only in the chemical contents of their pockets. Each plate is formed of a comparatively thin sheet of steel, 0.024 inch (0.61 mm.) in thickness, out of which rectangular holes are stamped, so as to leave a grid or frame somewhat resembling a window frame. In one style of plate there are three rows of eight such rectangular holes or recesses, or twenty-four recesses in all.

Each opening or recess is filled with a pocket or shallow box containing the active material. These boxes correspond to the panes of glass in the window frame analogy. The panes instead of being thinner than the frame, as in an actual window, are thicker than the frame, or project slightly beyond the surface of the steel grid. They are perforated with numerous small holes to admit the electrolyte, but entirely conceal the contained active material from view. All that meets the eye, therefore, in any of the plates, is the steel frame, and its embedded "windows" of perforated steel.

The active material is made in the form of rectangular cakes or briquettes, and one such briquette is lodged in each pocket or "window pane" of the plate. Each of the twenty-four recess plates, therefore, supports, or contains, twenty-four briquettes of active material, all in rigid contact with its own substance.

Each briquette is placed in a shallow, closely fitting nickel-plated box of thin perforated crucible steel, cut from a long strip of that material 0.003 inch (0.075 mm.) thick. A cover or lid of the same material is then laid over it, so that the briquette is closely enveloped by the sides and walls of its perforated steel box. The boxes are then placed in the openings or holes in the nickel-plated steel grid, and closely fit the same. The assembled plate is then placed in a hydraulic press, and subjected to a total pressure of about 100 tons. This pressure not only tightly closes the boxes, but it also forces their metal sides over the adjacent sides of the recesses of the steel grid, thus clamping the whole mass into a single solid and rigid steel plate with the hollow "window panes" full of active material. The nickel plating of both grids and boxes aids in securing good permanent electric connections between them. The finished plate has a grid thickness of 0.024 inch (0.56 mm.), and a "window" or pocket thickness of 0.1 inch (2.5 mm.). This is the maximum thickness of the plate at any point, but being of steel, the plate has ample rigidity.

The positive briquettes (zincs of a primary cell) are made by mixing a finely divided compound of iron obtained by a special chemical process with a nearly equal volume of thin flakes of graphite. The graphite does not enter into any of the chemical actions, but assists the conductivity of the briquettes. The graphite is divided into very thin laminae by a chemical process, and these are passed through sieves or screens so as to leave a size or area of flake that is much larger than the area of the perforation in the steel windows. The mixture is then pressed into briquettes in a mould, under a hydraulic pressure of about two tons per square inch. The briquettes have a surface area of nearly 3 inches by $\frac{1}{2}$ inch on each face.

The negative briquette (carbon of a primary cell) is made by similarly mixing a finely divided compound of nickel, obtained by special chemical means, with a nearly equal bulk of fine flakes of graphite and solidifying the mixture in a mould into briquettes of the same size as above.

A suitable number of positive and negative plates are assembled together, being separated from one another only by a thin sheet of perforated hard rubber.

The assembled plates are placed in a vessel or external containing cell of sheet steel containing the potash solution, which, of course, does not attack steel. There was, however, much difficulty from the action of the potash on the soldered seams of the steel containing vessel. After many trials, however, Mr. Edison found a solder which seems to be entirely unaffected by the alkali.

In charging, the current is, of course, sent into the positive pole and its attached negative nickel plate, through the electrolyte, and into the positive plate of the iron compound which carries the negative pole. This current deoxidizes or reduces the compound to spongy metallic iron and carries the oxygen through the film of electrolyte to the nickel compound, oxidizing it to the hyperoxide of nickel, NiO_2 , a higher oxide than the peroxide. In other words, the charging current simply carries oxygen in the opposite direction against the forces of chemical affinity, from the iron to the nickel, and stores the energy in the reduced iron, which is, of course, unaffected and passive in the presence of the potash solution. On discharge, the current passes from the positive pole through the external circuit to the negative pole, and then through the solution to the negative or superoxide plate. In so doing the oxy-

gen moves back against the current and partially reduces the nickel superoxide NiO_2 while oxidizing the spongy iron. The energy of burning of the iron and oxygen which would be developed as heat in the ordinary chemical process is now liberated in the circuit as electrical energy.

The cell is an oxygen lift. Charging pulls the oxygen away from the iron and delivers it temporarily to the nickel. The condition is then stable, until the circuit of the cell is completed. Discharge then allows the oxygen to fall back from the nickel to the iron with the natural affinity of iron and oxygen.

This action is very different from that which takes place in the lead storage cell. Here, neglecting complication, the action is usually regarded for practical purposes as being represented by the equation

where the left-hand side represents the condition of charge and the right-hand side the condition of discharge. Here oxygen is not simply transferred in discharge from the peroxide to the spongy lead, but the solution is changed (theoretically) from an aqueous solution of sulphuric acid to plain water. Of course the discharge could not practically be carried to the point of denuding the solution of all sulphuric acid, and a surplusage of acid must be used. The equation gives a mere theoretical outline of admittedly very complex reactions. In other words, the specific gravity of the sulphuric acid solution falls during the discharge, and the solution enters into the chemical combination. Theoretically, for every 445 grammes of active material on both plates, 196 grammes of sulphuric acid are required to effect the combination, or 44% by weight of the active elements, and in practice it is usual to allow a weight of sulphuric acid nearly equal to half the weight of the elements, or about one-quarter of the total weight of the cell.

(TO BE CONTINUED.)

Cyaniding Complex Gold Ores.

Written for the MINING AND SCIENTIFIC PRESS by
FRANK H. PROBERT, A. R. S. M.

In the MINING AND SCIENTIFIC PRESS of May 11th Prof. E. F. Gropello gave an account of the Dorcas pneumatic cyanide process, which cannot fail to interest all those interested in the leaching of complex gold ores. The idea of adding oxygen to the potassium cyanide solutions is by no means new, cyanide of itself being incapable of dissolving gold, although in the MacArthur-Forrest patents no mention was made of this fundamental fact. In the ordinary cyanide process the oxygen is obtained either from the air dissolved in the solutions or from the air mixed up with the particles of the material to be leached; but in treating coarsely ground or heavy sulphide ores the action of the potassium cyanide is slow, owing to the supply of oxygen being insufficient. For this reason it is often necessary to treat one batch of material with two or three different solutions, draining one off as another is added; by so doing the mass becomes oxygenated. The Dorcas process supplies oxygen by forcing compressed air into the vats, thus ensuring a more rapid extraction of the precious metals. Patents have been taken out for chemically oxygenating the ore, instead of mechanically, employing such substances as hydroxyl, sodium hydroxide, alkaline ferri-cyanide of potassium, etc.; but they have not come into general use. Whether the oxygen is supplied by mechanical or chemical means, cyanide destroyers are formed by the oxidation of base sulphides and by the formation of caustic potash, which, in the presence of copper, arsenic or antimony sulphides, form soluble compounds and so destroy the solution.

It was my good fortune, while investigating some extremely complex telluride gold ores of Western Australia, about five years ago, to meet H. Livingstone Sulman, the inventor of the bromo-cyanide process, and together we looked into the problem of the treatment of complex ores by the cyanide process. The object of oxygenating a mass of tailings is clearly to produce potential cyanogen to form the required gold cyanide; but by so doing caustic potash is formed, which has a deleterious effect on the potassium cyanide when complex ores are under treatment. By employing a haloid salt we not only liberate potential cyanogen, but an inert product is formed, and thus a considerable saving in the consumption of potassium cyanide is effected, while at the same time the rate of solution of the gold is greatly increased. The haloid salt of cyanogen will not of itself dissolve gold; but in the presence of a soluble cyanide its action is very rapid. In my experiments I employed bromo-cyanogen in conjunction with a weak solution of potassium cyanide. The ore treated contained sylvanite and a little iron pyrite. It assayed twenty ounces to the long ton. In the sample battery a 33% extraction was the highest obtainable—this being apparently the amount of free gold contained in the ore—the plates very soon became foul and the slimes ran very high. I therefore concentrated on vanners and caught the slimes by coagulating them with a weak soap solution and milk of lime. I then took samples of the raw ore, concen-

* DR. A. E. KENNELLY in Proceedings American Institute Electrical Engineers, New York meeting.

trates and slimes and subjected them to the action of potassium cyanide solutions of different strengths, solutions of cyanide to which bromine water had been added, and to a mixture of cyanide and bromo-cyanide solutions. With a .5% solution of potassium cyanide I obtained a 46% extraction in five days on the raw ore, with the added bromine water 54%, and with cyanogen bromide 60% extraction in twenty-four hours. I then tried roasting the ore in a muffle furnace and repeated the tests. The extraction was considerably augmented, the KCy + CyBr solution taking out over 80% in less than eighteen hours; but I found there was an appreciable loss in the gold values due to roasting. Whether the tellurous oxide formed carried precious metal with it up the flues I cannot say; but it occurred to me that the oxide might possibly form a film round the particles of gold and so interfere with the reaction. I therefore mixed varying proportions of charcoal, coal and anthracite with the ore to be roasted, ranging from 1% to 5% by weight of the charge, and submitted the roasted product to the solution, as before. With a .5% KCy + .25% CyBr solution I was able to get a 96% extraction of the gold contents in eighteen hours, as against a 60% solution in five days with the ordinary .5% solution of potassium cyanide.

As it is expedient to have free potassium cyanide present with the cyanogen bromine, it is advisable to remove the cyanide-destroying compounds by washing with water before leaching is commenced. Bromo-cyanogen is not dangerous to work with, it is readily prepared, is cheap and quick in its action. Of course, as the solutions are used and reused there is a constantly increasing amount of potassium bromine formed; but, by the addition of an oxidizing agent, the atom of bromine is liberated and at once attacks the cyanide of potassium present, forming cyanogen bromide. If there is an excess of the solvent present, brown paracyanogen is formed; but experiments show that weak solutions are the more efficient. In practice the strength should never exceed .3% CyBr.

These few notes may be of interest to the readers of the MINING AND SCIENTIFIC PRESS, and, I trust, may be the means of the bromo-cyanide process being tried on the many classes of ore found where this paper circulates.

The New Hollow Hexagon Turret Lathe.

This lathe, the Parke & Lacy Co. of San Francisco, who are agents for it, say, embodies in its design important improvements and features new in this line of machine tools. It is especially adapted for producing duplicate machine parts accurately and at a minimum cost; but the tools are set and changed for different kinds of work, so that when there are but few pieces of a kind a saving of time is obtained.

It has a capacity of bars up to 2" in diameter, which can be fed through the automatic chuck and turned any length up to 24". The swing of the machine is 16" over the Vs.

The bed, at the right, rests on a line bearing laterally, so that if the machine is placed on an irregular floor it will not be sprung out of alignment. Strength and rigidity are secured by casting the head solid with the bed. The head is equipped with back gears

which are universally adjusted. The relation between the fingers and rolls is such that when the fingers are adjusted for centering a given-size stock the rolls are in the proper position to give the requisite pressure for feeding the bar through the automatic chuck. By this means it is only necessary to see that the guide fingers are so adjusted that the stock will slide easily through; and, as there is but one screw for operating the fingers and the rolls, the whole adjustment is quickly made.

This tool has other commendable features. The saddle slides directly on the bed, eliminating all overhang. The Vs are as large as in an ordinary lathe of twice the size. The automatic feed rack is attached to the bed midway between the Vs. It is as high up as practicable, as near as possible to the center of the spindle, and directly under the cutting tools, thus reducing to a minimum all torsional strains in the carriage when moving along the Vs. The automatic feed is not only thrown in, but can be thrown out as well, by a single curved lever, thus avoiding an extra lever for disengaging, as is usually required. The feeds for operating the carriage are secured entirely by gearing, thus doing away with belts altogether; and, by means of a lever, the rate can be changed without stopping the machine, giving either a fast, medium or slow feed, and enabling the operator to use whichever feed is best adapted to the cut.

Forest Endowment of Pacific Slope.

NUMBER II.—CONCLUDED.

By PROF. J. G. LEMMON.

GREATER DESTRUCTION BY HEAT.—Following the Glacial came a Thermal age, with contrary effects, yet with more destructive results. The ice melts on the southern verge of the ponderous ice cover, allowing the plants to return, timidly seeking the newly-emptied glacier beds. Soon after, the flood water sinking into the mountain sides, the brown earth, becoming vivified, invites the grasses and flowers to new-made homes, while sunny parterres beckon to the spying trees, promising centuries of occupation—if they can stand the climate.

The rising heat rolling in waves from the south, nearer and nearer, urges on the lagging columns, adding the necessity of avoiding death to the attraction of better homes.

But the universal return of plants from the south was prosecuted under vastly different, more destructive conditions than those of the northern flight. The plants on the return trip were attracted northward along the cool plains, and, also, some of them upward on the mountain sides—for it is the same thing in effect to ascend a mountain for cooler weather as to journey northward.

Now, the first elevations beside a valley are usually low ones, foothills, outlying ridges or higher spurs. The plants that ascended these elevations, as the heat came on and proved too severe for their constitutions, were shriveled and burned then and there—the last battle ground and altar places where were immolated the greater part of the vegetable creation of the period.

THE LONE SURVIVORS.—Here and there straggling

proved by the characters of alpine plants on high peaks of the North Temperate zone. They are found to be identical with Arctic plants. Now, they could not have passed from northern regions directly to those summits during the southern flight, for the reason that both Arctic regions and these mountain tops were being slowly covered simultaneously with snow, soon becoming permanent ice. Manifestly cold-loving plants—our alpine plants—could ascend mountains only when fleeing from torrid heat, and exactly that condition was experienced on the return journey; so here on all the peaks of the north temperate zone are stranded Arctic species of plants, with less northern families established on the slopes of the mountains.

GREAT FOREST OF THE NORTHWEST.—It has been stated that Europe and Asia were deprived of their quota of plants by the many long transverse ranges of mountains preventing the passing of plants north or south, except through the wide gaps between ranges; while North America was favored by having nearly longitudinal ranges, permitting the free passage of plants to and fro along unobstructed plateaus.

The two long American watersheds—the Rocky mountains and the Alleghanies—delimitate three plateaus, Atlantic slope, Mississippi valley and Pacific slope. We have seen that the distribution of plants was not equal—the Pacific slope having the lion's share and largest growths. This is due principally to four potential agencies:

1. **CONDUCTED NORTHWEST BY HIGH PLATEAUS.**—The Rocky mountains, lying near the western side of the continent, extend southeasterly, upon the eastern side of the high plateau of Mexico, to Central America. The plants returning from the south at the beginning of the Thermal age, 80,000 years ago, were divided at the outset in southern Mexico, and a large part barred out of the Mississippi valley by the cordilleras, that killed off unfortunate individuals or families who ascended their foothills and spurs, as described, while other families or other members of the same families were attracted to the broad, free, and, at the time, cool and inviting pathway, along the high plateau of Mexico and Arizona, diminished at every degree by the many-spurred Rocky mountains, the survivors escaping to pass into the valleys and along the sides of the mountain ranges, some of them particularly directed northwestward again by the favoring coast plateau, decimated the while by the high, similarly inclined and destructive Sierra Nevada, to reach final destination in California and the region northward.

2. **DISTRIBUTED BY WARM JAPAN CURRENT.**—A very important agency helping on the capture and directing the distribution of the trees all along the western coast from California to Alaska, is the presence in the North Pacific ocean of the warm Kuro-Siwa, or Japan current, primarily a hot tropical current, striking the islands along the southern coast of China and deflected northward, to be more deflected by the Japan islands and hurled northeastward across the Pacific ocean, there striking the southern side of the long chain of Aleutian islands, which turn a part of the current down along the coast of America, delayed and accumulated during its long sweep by the many islands and capes on the way, while its heat rises into the atmosphere, carrying with it enormous quantities of water.

3. **NOURISHED BY MOIST LANDWARD BREEZES.**—Another factor closely connected with the preceding is found in the cool, broad, overrunning Pacific breezes that prevail most of the year on the northwest coast. Mingling with the heated and moisture-filled air over the Japan current, the volume presses inland, the moisture condensing and falling most copiously upon the nearest cool elevations—giving sustenance and stimulus to the richest and most remarkable forest on the face of the globe.

4. **DEVELOPED BY SEMI-TROPIC HEAT.**—The fourth factor necessary, it is found, for the production of largest growths, is a high degree of heat, of which the Puget sound region lacks sufficient for some plants, although many of her trees, such as the Noble, Grand and Amabilis firs, and the very valuable gigantic cedar, or shingle tree, become monsters, and the Douglas spruce, one of the most valuable timber trees on the earth, becomes in Oregon and Washington the tallest trees known—450 to probably 480 feet high!

This necessary heat is found under the semi-tropic sun in the latitude of California. This heat, added to the enclosed condition of the State—the high Sierra on one side, the lower Coast Range on the other admitting the ocean breezes through its passes, and with low, interlocking ranges at each end—furnishes just the right conditions, it seems, for strongest allurements to enter and for highest development afterward; for here only, in this cul-de-sac of California, are found the largest cone-bearing trees on earth, of some nine different genera; and here only are found the largest and heaviest cones of sixteen different species.

Is it not passing strange that out of the twenty pines of Europe and Asia, and the twelve pines of the Eastern States, not one should develop cones as large as either one of five pines in California?

TRIBUTE TO CALIFORNIA CLIMATE.—The great truth

Hollow Hexagonal Turret Lathe.

(triple back gears can be applied when required), which can be thrown in or out by friction clutch operated by lever, and the head cone, which has large diameters—9", 11" and 13"—takes a 3" belt.

The chuck is operated by a lever working through a system of compound levers, which gives a long movement to the spindle sleeve for feeding the stock and a powerful movement at the end of the stroke for tightening the chuck.

The same lever which operates the automatic chuck controls the roller feed; and since the roller feed does not depend for its power upon the revolution of the spindle, the stock can be fed with equal advantage whether the machine is running slow or fast, or even if it is standing still. By means of a single screw, both stock rolls and the centering or guide

members of a family, reaching a locality on the plain or part way up a mountain when the present equilibrium of seasons was established, found themselves suited to the environment—and it is the descendants of those plants that are the inhabitants of our plains and mountains to-day.

These terminals of broken lines of development—these remnants of a past multitudinous vegetation—ever since they were allowed to exist and perpetuate their kind, have been obliged to wage war upon neighbors from generation to generation, in order to gain or retain a foothold, resorting to changes of ground, of character, of weapons, in order to win in the incessant battle of life.

PROCESS OF DOUBLE MIGRATION.—That the plants have made the double journey described is plainly

is forced upon the attention that it is California that was set apart from all the world when, as the geologists tell us, the Pacific slope was raised from the ocean bed, in recent geologic times, by a mighty geotherm or earth heat wave, with the Sierra and Cascade Range as its axis of elevation, followed in a later age by another uplift, with the Coast Range as its axis; while the long, narrow valley between the ranges was cross-fenced by low mountains into several magnificent parks, principal of which are the valley of California, the smaller Willamette valley and the extensive Puget sound region.

Of these, California was assigned first place in the pathway of the southern fugitives, inviting to enter and urging to tarry and form a natural, unexampled arboretum within her mountain walls, supremely aided thereto by a semi-tropic sun dispensing beneficent heat—the whole array of factors mentioned conferring to produce the most generous and forcing climate on the face of the earth—as magnificently evidenced by this matchless forest endowment.

Mining and Metallurgical Patents.

Patents Issued June 4, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR CONVEYING GRANULATED MATERIALS.—No. 675,382; K. Frohnhauser, Dortmund, Germany.

The combination of a trough or conduit on floor of which material is supported while being transported, a body of liquid in conduit, and propelling means arranged to move longitudinally of conduit and engage material, the liquid reducing weight and friction of material and assisting in conveying it.

ROCK DRILL.—No. 675,490; C. T. Litchfield, Spokane, Wash.

A cylinder, a diaphragm dividing the cylinder into two chambers one of which is inlet and other outlet for cylinder, a piston arranged in inlet chamber and a plunger arranged in outlet chamber, a hollow piston-rod passing fluid-tight through diaphragm and rigidly connecting piston and plunger, and having a series of ports near opposite ends, and valve arranged in hollow rod and provided with longitudinal bore opening axially at one end and laterally near other end and co-operating with several ports in hollow rod to control admission and exhaustion motive fluid so as positively to effect movement of piston in both directions.

GRIZZLY OR SCREEN FOR WASHING PLACER GRAVEL, PHOSPHATE, OR ANY ANALOGOUS MATERIAL.—No. 675,610; W. S. Russel, Toledo, Ohio.

The combination, with a grizzly shell, of a hollow tapering cylindrical stopper shell located within receiving end of grizzly shell and having larger end throughout circumference engaging inner wall of grizzly shell and projecting toward discharge end of grizzly shell while smaller end is of less diameter

than grizzly shell and projects toward receiving end of grizzly shell, and a tapering stopper ring located within receiving end of the grizzly shell in advance of stopper shell connected thereto and having larger end projecting toward receiving end of grizzly shell and secured to and engaging interior wall thereof.

GOLD SAVING APPARATUS.—No. 675,514; A. W. Lockhart, San Francisco, Cal.

A gold-washing inclosed suction or hydraulic sluice, a discharge box consisting of a receptacle attached to sluice and covering an opening in side, receptacle having a hinged bottom whereby load upon bottom of box releases lever and allows rocks to be dumped and whereby hinged bottom is closed again as soon as released of its load, and means for projecting rocks or other material from sluice into discharge box.

WATER SAVING MINING MACHINE.—No. 675,583; F. Auser, San Francisco, Cal.

A sluice box and an endless traveling belt with ruffles; side protectors with apertures, having on outside covers to keep water flowing through apertures confined to box below—all in combination with means for saving water in a receptacle.

AMALGAMATING APPARATUS.—No. 675,660; A. Lavoix, Paris, France.

The combination with a vertical exterior cylinder; a cover to cylinder and a pedestal in bottom of cylinder;

der; of an interior, vertical, revoluble cylinder journaled as to its lower end in pedestal and adapted and arranged to turn within exterior cylinder; a screw piercing cover and arranged to form bearing for upper end of interior cylinder; a worm-wheel on screw; a worm engaging wheel; means for actuating and supporting worm, whereby facility is afforded for regulating pressure of screw upon interior cylinder; of a bevel gear-wheel mounted upon top of interior cylinder; a shaft journaled in cover of exterior cylinder; a pinion mounted on shaft and engaging bevel wheel, and means for actuating shaft, whereby the interior cylinder is made to revolve within exterior cylinder.

CONCENTRATOR.—No. 675,799; E. A. Sperry, Biwabik, Minn.

A base, an intermediate frame and an upper frame, a shaft on which intermediate frame is mounted to rotate, having an eccentric portion on which upper frame is mounted, a gearing for rotating intermediate frame on shaft, a gearing for rotating shaft, and a table supported on upper frame, two frames and table being rotated together.

QUARTZ MILL.—No. 675,872; A. Ford, Golden Gate, Cal.

Shoes separated to provide a discharge opening and having inclined undulating surfaces, plates closely set on edge between shoes and acting to screen material passing through discharge, and a rocker placed between shoes above plates, and having inclined undulating surfaces complementary to shoe surfaces.

PICK.—No. 675,626; E. H. Grim, East Radford, Va.

Opposite cutting members, having inner ends overlapped and provided with inner corresponding recesses forming a handle receiving eye, inner end of one member having hook, provided with intermediate lug or projection upon outer side, and adjacent portion of other member having recess for reception of hook, and having a groove notch in its wall for reception of lug or projection, and a detachable fastening for members at opposite side of eye.

COMPOUND OF MATTER FOR ARTIFICIAL FUEL.—No. 675,639; L. Patry, Montreal, Canada.

The composition of matter for artificial fuel, consisting of crude petroleum, potash, common asphalt, unslaked lime, and peat, in proportions specified.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Jarvis & Crowell and Captain H. N. James have bonded to Patrick Clark of Spokane, Wash., five claims a few miles back from Crackerjack P. O., Prince of Wales Island, for \$75,000. He will develop them at once.—R. Allison bought a one-third interest in a claim on Twelve-mile Arm for \$100, from which claim he took eighty-three pounds of ore and sold it to the assayer at Crackerjack for \$415, or \$5 a pound. The claim was located during the winter. It is a free-gold proposition and is very rich.—The Mt. Andrew M. Co., on Kasaan Peninsula, have shipped in this spring 130 tons of supplies to their camp near Grindall.

ARIZONA.

YAVAPAI COUNTY.

The Bullard group have been placed with a German syndicate of New York for \$575,000, the promoting syndicate to sell to another one for \$1,250,000. The group consists of twenty-seven claims. The development of the property has resulted in the discovery of a large body of ore of good value in gold and copper. R. E. Fowler of Salt Lake City, Utah, has turned the management over to representatives of the New York people.

The Gold Wing group in the Gila mountains, near Adonde, have been bought for \$10,000 by the Arizona & Arkansas L., Z. & C. M. Co., a Los Angeles, Cal., corporation.

W. H. Barnes of Tucson has sold for \$100,000 the Henrietta mine, which was bought by him several months ago for \$20,000. This mine is one of the oldest properties in northern Arizona.

CALIFORNIA.

ALPINE COUNTY.

The old Colorado mill at Loope, after a shutdown of twenty years, was started on the 10th on ore from the Lewis mine at Gardnerville, of which Capt. P. Curtz is superintendent.

AMADOR COUNTY.

Robinson Bros. are said to have recently made a good strike in their gravel claim, near McLaughlin's station. They took out one nugget weighing \$165, and have taken out a number going from \$8 and \$10 up to \$25 and \$30.

Work is progressing on the Amador Phoenix mine, near Jackson. The shaft has been cleaned out and retimbered, and ore is being taken out. A 10-stamp mill is being put up, and within six weeks will be working.

BUTTE COUNTY.

The Nevansville Drift M. Co., operating at West Branch, have elected J. T. Hallett Pres., G. P. Rixford Sec., A. Van der Naillen, Jr., Gen. Mgr. and P. L. Sheldford Supt. The latter has taken charge, and is reopening the mine, which has been closed down some time.

CALAVERAS COUNTY.

Rich ore has been struck in J. B. Maguire's mine at Mokelumne Hill. Some of the rock contained more gold than quartz and a single specimen was sold for \$50.

Reed & Haggerty, prospectors, have made a lucky find while working on the Tom & Dick mine, at Mokelumne Hill. They have uncovered a 12-inch ledge of fine ore.

The old Innes, now the Giuffra quartz mine, at Mokelumne Hill, is to be reopened by H. Thompson. He has bought the El Encino hoist and has removed it to the Giuffra mine. Sinking in the shaft will be commenced.

The Salvador G. M. & M. Co. has incorporated, to mine at Mokelumne Hill, with Directors H. C. Newman of San Francisco, W. C. Ramsey, F. R. Clark, H. M. Lander, P. Taglio and G. B. Parkinson of Stockton, and F. Lagomarsino of Mokelumne Hill.

J. O. Stewart of the Anglo-Saxon mine, at Rich Gulch, says work will soon be started on the Tiger vein of that mine.

J. C. Jens has taken charge of the Loring property, at Rich Gulch, and is erecting a blacksmith shop, boarding house and other buildings, and will soon begin sinking a new shaft.

Water was struck in such quantities recently at the Whittle mine that operations had to be suspended, there being 27 feet in the shaft. It could not be handled by the whim, and an engine will be put in at once.

New and heavier machinery is being put the Jones mine at Glencoe, and the old is being removed. The new hoist is nearly completed. The mine is owned by the Fanny Maria G. M. Co.

The McHaley mine, above El Dorado, as resumed sinking. The Emery Co. has

a bond on it and will sink the shaft 200 feet deeper and crosscut to the ledge.

J. S. White and associates have taken the Austrian Hill placer mine, at Cave City, and hydraulicking will begin soon. The old ditch has been enlarged and reservoirs built.

Dixon & Edmonds have put a pump on the old Gunther gravel mine and are unwatering the old workings, preparatory to breasting out gravel.

Both the north and south drifts on the 400-foot level of the Oriole mine, at Carson, have opened up rich ore, the rock being said to be literally filled with gold. The work of erecting the mill will be rushed.

Surveyors of the Southern Pacific Co. have surveyed an extension of the narrow gauge system from Valley Spring to the Gwin mine, a distance of 6 miles. The Gwin G. M. Co. are said to have offered a bonus for the extension, and the survey is made to ascertain whether or not the proposition by the mining people will justify the outlay by the railroad company. If made, the terminus of the narrow gauge system will be within 6 miles of Jackson.

As soon as the Cuneo ditch is cleared, work will be commenced on the mine at Fricot City. The tunnel, now in 200 feet, will be run 200 feet farther. The mill will be kept running steadily.

Mr. Moores has commenced work on the Grace Darling mine, at Fricot City. A tunnel will be run to open the vein at a depth of 400 feet.

The Garibaldi M. Co. has suspended work on the Garibaldi mine, the pump failing to keep out the water. A larger pump will be put in and work resumed.

EL DORADO COUNTY.

The old Burnham mine at Georgetown has been bonded to a Mr. Kelley, representing Butte, Mont., people, at \$10,000.

The Starlight mine, near El Dorado, has been bonded.

KERN COUNTY.

J. Smith is finishing operations on the tailings of the Little Butte mine, there being only 100 tons more to treat. The last clean-up was \$950. The slimes are now being treated with the usual difficulty in making the percolation. He has installed a compressor and is pumping air through the mass. This has the mechanical effect of separating the particles so that the cyanide can do its work, and also furnishes oxygen.

MONO COUNTY.

Supt. C. H. Glines of the Par Value-Arnot mines has started up work and is repairing damages done by the storms last winter, the mill and other buildings having been crushed in by the weight of snow that fell.

Supt. J. W. Kelly of the Bodie south end mines expects to have the Red Cloud shaft equipped with hoisting machinery within thirty days, when development will be commenced.

NEVADA COUNTY.

It is reported work will be resumed at the Banner mine at Nevada City. J. R. Phillips of Stockton, formerly Supt. of the mine, is at the mine, accompanied by A. R. Adams of New York.

D. E. Matteson, F. J. Thomas, J. M. Thomas and C. E. Clinch of Grass Valley have bought a controlling interest in the Tule Belle M. Co. and have bonded several adjoining properties, aggregating 164 acres, about 1 mile from Grass Valley and south west of Massachusetts and Gold Hill. The Cincinnati claim was extensively worked in early days, but the others are new properties. On the Tule Belle there is a shaft 200 feet deep on a vein from 12 to 18 inches thick. The company will continue this shaft and prospect their ground through it. The work is to be started at once. The Tule Belle Co. has elected D. E. Matteson president, J. R. Tyrrell secretary and A. J. Blackburn Supt.

The engine, boiler and machinery for the reopening of the Lamarque group of mines have been placed in position and are in working order. The engine is 40 H. P. and the owners say capable of hoisting from a depth of 1200 to 1600 feet. The shaft will be pumped out. It is down 320 feet and it is understood that not all the ore in sight has been stooped out. That taken out was of high grade and said to have averaged \$31 per ton at the mill. The Lamarque was but recently bonded by E. J. Caldwell and C. F. Seitz.

SHASTA COUNTY.

E. W. Brackett has uncovered a shoot of sulphuret ore in the Mount Pleasant mine, west of Redding. The mine has been a steady producer all winter, the output being sent to the Keswick smelters.

The Mammoth group of copper claims in the Backbone district, west of Kennet, have been bonded to F. G. King, who has put a crew of men at development work on the Mammoth, one of the group. Lindley Morton, representing California capital, is said to have offered him first

\$25,000 for his option, and now the amount has been increased to \$40,000.

The Mount Shasta G. M. Co. have incorporated to work the Mount Shasta mine. The incorporation was made in South Dakota, with a capital of \$1,000,000. The directors are L. F. Menage of Minneapolis, F. E. Ware of San Francisco, H. S. Gilette of Chicago, H. S. Anderson and O. Nelson of Pierre.

The new smelter of the Trinity C. Co. will probably be located 1 mile south of Kennet at the juncture of Squaw creek and the Sacramento river. B. Golinsky agrees by contract to deed forty acres of land to the company free, under certain conditions, one being that the building of the smelter must begin within ninety days. The Trinity Copper Co., of which T. W. Lawson is the head, has a working capital of \$750,000. A large number of men are employed opening the mines and building roads.

SIERRA COUNTY.

Five tons of sulphurets from the Gold Bluff mine at Downieville have been shipped to the Selby Smelting Works.

W. F. Johns, Supt. of the Sierra Buttes mine, representing the Sierra Buttes M. Co., gave possession of the Plumas Eureka mine at Johnsville to Lessees J. K. O'Brien, W. Metcalf and F. Vanzini.

It is reported that a rich body of ore has been struck in the Telegraph mine at Fir Cap. The tunnel has been driven on the foot wall of a ledge which has been showing up very favorably and offers a good milling proposition. The tunnel is being pushed ahead for the purpose of striking the gravel channel.

The California Debris Commission will hold a special meeting on June 24 to hear applications to hydraulic from A. Lundberg, in the Joseph Thomas mine, at Plymouth, Amador county, to deposit tailings in Indian creek, and from S. I. Simmons et als., in the Victor placer mine, in Negro canyon, Sierra county, to deposit tailings in Charcoal or Negro creek.

Extensive improvements are to be made at the Plumbago mine at Alleghany. The electrical machinery is to be added to and improved. The power house on the Middle Yuba river now has two dynamos. Two more and other machinery are to be added to this plant. When completed electricity will be furnished the Oriental and Oceola mines, also at Alleghany. On the latter a 10-stamp mill will probably be erected soon. The distance of transmission is about 10 miles. W. J. Organ is in charge of the proposed improvements.

SISKIYOU COUNTY.

The Blue Ledge M. Co. of Crescent City, who own copper and gold claims on Joe creek, a tributary of the Applegate river, have their tunnel in about 90 feet and running in solid ore, which assays from \$4 to \$60 in gold and from 3% to 30% copper.

J. Kelley, who has been prospecting for a few months past in the hills near Muginsville, Scott valley, shows some very fine specimens of quartz, full of gold, and thinks he has struck a bonanza.

It is reported that a prospector has discovered a strong quartz ledge on Klamath river, near Honolulu, which he has traced a long distance and which is 150 feet in width.

A large porphyry dike has been opened up on the Mountain Laurel mine, owned by the Yreka M. & M. Co. of Rollin. It averages from 10 to 15 feet thick and the pay shoot is from 40 to 50 feet and mills from \$10 to \$15 in free gold.

The Jillson mine at Henley is reported to have struck the pay shoot again.

G. Gerkin has bonded the Flying Dutchman and Gold Standard mines, near Cecilville, owned by Harry Bowerman, and put men at work prospecting.

Peterson Bros. will take out not less than \$4000 for this season's washing. Some of the gold is very coarse.

J. Daggett, manager of the Black Bear G. M., at Black Bear, says that the big Yellow Jacket ledge is prospecting finely and that it will furnish milling rock.

SOLANO COUNTY.

The Pacific Portland Cement Co. has been incorporated to operate a cement works near Suisun. The capital stock is \$1,000,000, and the company has bought a deposit of cement rock of satisfactory quality for the manufacture of Portland cement. The cement plant will require about thirty acres of land, and is expected to cost about \$250,000, and, including other improvements to be made, the total outlay will exceed \$500,000. The company consists of San Francisco people.

The Armijo Oil Co. at 350 feet has struck a strong seepage of a clear yellow petroleum of superior quality in the well they are drilling 3 miles north of Fairfield. The Vacaville Oil Co. at 1200 feet, after casing off a very large flow of salt water, has developed a strong gas flow and a little oil at their well at Vacaville.

TUOLUMNE COUNTY.

The Laurel G. M. Co. have eight men

at the Free Lance, on the Dan Berger ranch, under Supt. J. Richards. A mill test of fifty tons of ore is being made. As says recently made show a value exceeding \$8 per ton. This mine is so situated that mining and milling of the ore can be done very cheaply. There is a 5-stamp mill, concentrators and everything necessary to carry on the work of mining in a systematic manner.

At the Jumper mine, at Quartz, the clean-ups of the past two months have been satisfactory, the sixty stamps crushing ore from the Jumper and Golden Rule mines. In the latter, at the north end, the company is taking out fine rock in considerable quantities. The shoot has proven more extensive than was anticipated when first struck.

At the Goldwin mine, near Carters, about four weeks ago, a vein of good ore was struck. Of this vein, 7 feet wide at that point, a streak about 13 inches wide next to the foot wall was very rich. Since then they have sunk 50 feet in ore, and with depth the quality improves and the vein grows wider, being now 16 feet; and the rich streak next to the foot wall shows 3 feet. A new 10-stamp mill has been erected and is being tested preliminary to starting the crushing of ore.

Williams & Emslow have bonded the Feliciana mine, at Moccasin creek, and will go to work at once.

The Ajax's hoist and mill, recently completed, has started up.

No. 3 shaft on the Santa Ysabel, originally the old Miller & Holmes shaft, is being unwatered and work is to be resumed there at once. Nos. 1 and 2 are completely shut down.

The mill at the Draper mine is now completed. Considerable work is laid out, including a trestle work for a car track and a large ore bin. A canvas plant is also projected. The mine is said to be looking well.

A new 5-stamp mill is being erected on the Mayflower, above Summerville.

YUBA COUNTY.

Salt has been recently manufactured in a small way from the water of a salt spring on the McMillan place near the old Sweet Vengeance mine at Brown's Valley. It is believed by sinking wells that a sufficient quantity of the water could be had to make a profitable business of the salt manufacture.

COLORADO.

ARAPAHOE COUNTY.

For the five months ending with May 31st the receipts of gold at the Denver branch mint reached \$7,506,210.94, compared with \$7,517,182.91 for the same period last year. This season the books were closed one day early, and on that day \$206,000 in gold was deposited. The placers have thus far made but few deposits.

CLEAR CREEK COUNTY.

C. Hulbertson has interested Eastern people in a group of eight claims near Georgetown, who propose to make a systematic development of the property.

The Gillard mine, idle for some time, is beginning work again. When the mine was working, the contractors sinking the shaft opened some fine-looking quartz, showing visible gold. A sample was sent to Denver and assayed, giving 23.90 ounces in gold and 77.30 ounces in silver per ton. The shaft is now down a little over 100 feet and work will be continued by drifting on the vein and sinking 100 feet deeper. A shafthouse has been erected and machinery is in place in it.

DOLORES COUNTY.

S. O. Burgwin and partners will do considerable work on the Como group, near Rico. This group embraces the Amorette, Emma, Eclipse and Smuggler veins on the north side of the river, which have produced some very high-grade ore.

HINSDALE COUNTY.

E. Ray, manager of the Sherman mine, near Lake City, says in a recent report to the company office in Denver that the workings on the Champion lode are looking remarkably well. The drift on the vein is advanced 14 feet daily, and at the face shows 6 feet of ore. The ore taken out has shown from 15% to 17% copper.

The Contention M. Co., at Lake City, intend to erect a 100-ton concentrating mill at once, and grading for it is under way. The mill will be so constructed as to receive the ore directly from the mine cars, which will dump into bins at the crusher. The process for reducing the ores to concentrates will be similar to that in use by the Golden Fleece Co.

LAKE COUNTY.

F. X. Hogan has made formal application to the city council of Leadville for a lease on the mining rights under the streets and alleys, and the proposition is now under consideration. Mr. Hogan believes some fine stopes will be developed and he is willing to sink shafts and explore for them. The strike and trend of

the iron channel as proven in the Home Extension seems to be crossing Harrison avenue.

ROUTT COUNTY.

It is reported that a rich strike has been made in the new copper district at Farwell, east of Hahn's peak, by C. Morris and J. Wagner, lately from Philadelphia, who, in clearing for the foundation of a cabin, uncovered an 8-foot wide vein of ore about 3 feet below the surface, which assayed, it is said, 17% copper and thirty-five ounces silver, a total value of \$70 per ton.

SAN MIGUEL COUNTY.

C. Bullock, president of the Butterfly-Terrill Co. of Telluride, says the results of the amalgamation on the mill plates for the last two weeks of May were about \$6400. The total production for May was 1360 tons, yielding about \$13,000. The profit on the month's operations will be above \$6500, the expenses being not more than 50% of the output. The saving made in amalgamating and concentrating is remarkable. Careful assays of the crude ore and of the mill tailings show that the latter contain but 3% of the value of the ore.

A. B. Frenzel has been prospecting for some time in the vicinity of Newmire and Placerville for some of the rare metals. He claims to have been successful. Near Newmire he has nineteen claims yielding a vanadium ore. It is a bedded formation resting on sandstone and capped with limestone. In appearance the ore resembles the sandstone, but is colored green. He claims much of it will run 6% and 7% in vanadium, and that 2½% is sufficient to make a good shipping ore. He is preparing to ship an experimental carload of five tons to Europe. If it results satisfactorily, a local treatment plant is to be built. The large use of vanadium is in some steel-making processes. Mr. Frenzel says he has also found uranium ore in Placerville which he proposes to develop.

SUMMIT COUNTY.

After a series of experiments, the Cashier mill, at the Cashier mine, at Breckenridge, is successfully treating seventy tons of ore per day. Twenty-five to thirty men are employed in the mine and mill, and Manager Wood says the property is on a dividend-paying basis.

TELLER COUNTY.

The Granite mine, on Battle mountain, has resumed operation, and within a very short time about 200 men will be employed.

The claim of the Marie M. Co. to a lease on the Pharmacist was revived recently by a court order appointing J. Murphy receiver of the leasing company, to take possession of the property.

Copper ore has been opened up near Cripple Creek, on Bluff mountain, 1 mile from the mouth of the old Moffat workings on Red mountain, known as the Galena. The ore has been thrown over the dump in the search for gold by an Eastern company. C. Keaser, Supt., sent some of the ore to the company office at Canon, O., where it was found to carry copper. A mill test made later returned 12.76% copper. The ore has been opened on the Diamond claim, owned by the Canton G. M. & M. Co., which also owns twenty-one acres in addition to the Diamond.

It is reported that the visit of N. P. Williams, president of the Isabella Co., to Europe is in connection with the sale of the property.

The Monument Co. has granted two leases on its Battle mountain property, the north end of the recently purchased Mary Alice claim going to D. Heaton and the south end to H. T. Brown. Extensive developments are projected by both lessees.

IDAHO.

BOISE COUNTY.

This is written from the Pearl district, 25 miles north of Boise City. Here is a granite-porphry formation, cut by numerous parallel veins which run east and west and pitch to the north. The vein characteristics are iron and lead bases, carrying gold, silver and lead values. Near the surface the ores are oxidized, with sulphides below the 100 or 150 foot levels.

The Checkmate mine and mill, belonging to Salt Lake City parties, with J. W. Thompson as superintendent, is the best illustration of what the district is or can be. The Checkmate shaft is 400 feet deep, with levels run on the vein at each 100-foot station, aggregating possibly 2000 feet of work on the vein. Here all below the 100-foot level are sulphides, and the forty-five to fifty tons of ore being hoisted daily comes from below that level. Steam power is used for hoisting and larger facilities are to be put in.

The mill has a crusher, ten stamps, amalgamating plates, two Wilfley tables and one Johnson. Below the plates are a series of gold traps, consisting of two

cylindrical tubs, each 10 inches diameter at the top, 6 inches at bottom and 16 inches deep, with a pipe to carry the plate tailings to the bottom of the tub, where the requisite amount of quicksilver is deposited. The constant overflow from these tubs passes through a series of boxes, each 4x6x16 inches, where certain coarse, rusty particles of free gold are caught by gravity. This product passes to a pan with a revolving muller, containing quicksilver, where these gold particles are brightened and amalgamated. Finally the pan tailings go to the settling tank, and settlings therefrom are shipped as concentrates, carrying two ounces gold, fifteen ounces silver and 15% lead.

The overflow from the gold traps passes to the Wilfley tables, which make a coarse, heavy product, the slimes from the latter being elevated to a classifier. The settlings from the latter are treated on the Johnson concentrator, the overflow from the classifier passing to canvas tables. The product of the Johnson concentrator runs about ten ounces silver, one and one-half ounces gold and 12% to 15% lead. The concentrate product, as a whole, represents about six tons ore to one ton concentrate, and carries about 3½% silica and 30% iron. It is claimed that 90% of the assay values are saved, about 40% of the total saving being by amalgamation. About one-fourth of the mine tonnage is sacked and shipped to the smelters without concentration.

The I. X. L. mine and mill are under the management of H. W. Dorman. The northeast and southwest vein here is opened through two tunnels, one of which cuts the vein at 135 feet from entrance. There are about 250 feet of work on the vein on this level, besides a winze 40 feet deep and several upraises. A lower tunnel is being driven that will cut the ledge 850 feet below the upper tunnel. The mill on the property is provided with crusher, two sets rolls, revolving screens and Bartlett tables and plates. The ores are an iron sulphide, with good gold and fair silver values. A shipment resulted quite satisfactory. The mill is now idle, but it is expected to resume work soon.

The El Paso, in the same locality, is being well opened up. This entire district is in a range of hills that overlooks the valley of the Payette river.

Pearl, June 4.

S. L. Tipton has bonded the "You Know" group at Pearl. Considerable development has been made on the property, making an excellent showing. The ore at depth is sulphide, though on the surface it is free.

The Twin Sisters mine, in the Boise basin, near Centerville, is being equipped with a 5-stamp mill. The property is owned by Pittsburgh, Pa., parties, J. Hutchinson of the Trade Dollar Co. being general manager, and E. F. Blaine superintendent. The latter says that a mill will be installed as quickly as possible for the purpose of ascertaining the actual value of the ore. The development has reached a vertical depth of 250 feet. There is a considerable body of ore opened up.

IDAHO COUNTY.

At the stockholders' meeting of the Buffalo-Golden Gate M. Co. the following officers were elected: President, E. C. Steele; secretary, G. W. Tannahill. The company owns the Gold Bug, the Golden Eagle and the Old Gold claims in Buffalo Hump. Considerable development has been done and the company states that men will be put to work on the claims at once.

The Blue Jacket M. Co. intends to install a 30-ton smelter near its property in the Seven Devils this season. Manager F. J. French of the company has stated that this would be done.

SHOSHONE COUNTY.

Wardner people who own a group of claims near the Crown Point have formed a company. They have purchased the 150-ton concentrator which stands on the Granite, in the Coeur d'Alenes. The company is called the Wyoming M. & M. Co. P. P. Weber of Wardner is president. They have contracted for 200 feet of tunneling and a wagon road to the mine.

MONTANA.

The Bear Gulch Railway & Con. M. & S. Co., capital \$2,500,000, has been incorporated at Spokane, Wash., by H. Bush and M. Strong of Spokane, Wash., and A. Livingston of Livingston, Mont., to operate in Bear gulch, near Cinnabar. A 20-mile railway to connect the mines with the Northern Pacific system is under consideration.

FERGUS COUNTY.

A. S. Wright of Denver is reported to have made a rich find in South Moccasin. He has a bond at \$50,000 on the Cliff and Mosher mines in Whiskey gulch, and since the first of March, it is said, has taken out more than \$40,000. The mines

of Whiskey gulch are described as on a mountain of ore, with pay from comparatively shallow workings, all of which are in ore. The ore requires cyaniding and one large mill has been erected, which has all the ore it can handle. Another mill will be erected this season.

The owners of the Kendall group, near Lewiston, have incorporated the Kendall G. M. Co., capital stock \$2,000,000. The trustees are A. B. Campbell, J. A. Finch and R. K. Neill of Spokane, H. Wick of New York and H. T. Kendall of Lewiston.

FLATHEAD COUNTY.

The Canyon group, about 12 miles from Foundation, has been bonded by G. Wurm of Thompson Falls to F. Stevens of Murray, Idaho, at \$50,000, time eighteen months, and first payment in four months. Work is to begin immediately and continue without interruption. It is a free gold property.

JEFFERSON COUNTY.

A strike is reported made in the Elkhorn Queen mine at Elkhorn. Specimens of ore carrying native silver in large quantities have been taken out. The extent and value of the strike are not known at the office of the company in Helena.

LEWIS AND CLARKE COUNTY.

L. S. Woodbury of Great Falls, who recently bonded forty acres in Kenwood, has commenced work on a shaft.

Mr. Dougherty of Omaha is said to be planning the construction of a 50-stamp mill at Mammoth, to be run by electricity generated by water power from the South Boulder. The men at work in the mines have been laid off until the mill is erected.

MADISON COUNTY.

J. Berkin and E. J. Roller of Butte have sampled the Kearsarge mine, near Virginia City. It is understood that they will buy the bond on the mine at \$10,000, now held by C. E. Damours.

NEVADA.

LANDER COUNTY.

G. A. Thorpe has started work on his antimony mines, near Austin, taking out ore for shipment.

LINCOLN COUNTY.

F. C. Perew of Searchlight has arranged to buy a 20-stamp mill, to be erected at the Quartet mines, in Searchlight district. The company has an 80-stamp mill in operation on the Colorado river, the ore being hauled from the mines to the mill while awaiting the completion of the railway now being constructed. This new 20-stamp mill, Mr. Perew states, has been made necessary through the striking of a considerable body of water in one of the company's claims. He is quoted as saying: "In twenty-four hours after striking the water our heaviest pump was working and threw out 50,000 gallons of water. This did not reduce the flow at all, and we feel that the water question is solved; we will get our mill at the mines, instead of having it several miles away on the river."

R. S. Seibert of Los Angeles, owner of the Potosi mine in the southern part of the county, has leased and bonded the property to C. M. Thayer at \$100,000.

LYON COUNTY.

The Excelsior Co.'s smelter in Mason valley started up recently and the first twenty-four hours turned out copper matte valued at \$6100. After a few days it was shut down, the iron ore supply giving out. The matte is between 60% and 70% fine. In the mine the ledge has been cut on the 200-foot level and shows 45 feet of the same ore as the company has on the 50-foot and 100-foot levels, and the wall on the 200-foot level has not been reached.

NYE COUNTY.

The last returns from ore shipped from Tonapah are as follows: Dunlap, Douglass and Stewart, 302 ounces of silver and \$75 gold; Brougher, 423 ounces of silver and \$78 gold; D. Fitzpatrick, 300 ounces of silver and \$85 gold.

Seven carloads of Tonapah ore were shipped to Selby's recently.

It is reported that there are now 500 people at Tonapah, including forty women.

J. G. Booker, who is surveying the county line at Tonapah, has written a letter to Commissioner Douglass, in which he says that he has not yet completed the work; but, from the measurements so far taken, he feels justified in saying that Tonapah is in Nye county.

At the present time there are about 400 men employed in Tonapah, mostly on leases, and the lowest grade of ore being shipped out is over \$100 per ton. Much goes seven and eight times that amount. From eight to twelve teams are employed daily in hauling out the ore to Sodaville, the shipping point. J. Butler, the discoverer, owns five-eighths of all the claims in that vicinity, but is leasing them at a royalty of 25% of the net result. Considerable development work is being done

on all the claims in the district, and the most flattering results have been obtained. In fact, it is stated that every foot of ground which is excavated in a shaft 6x8 feet represents a gross value of \$750.

WASHOE COUNTY.

N. B. Clark of the C. & C. mine, on Peavine, says a shaft on the lead shows very rich ore at 180 feet depth. A tunnel is being run to get a depth of 500 feet, and is advanced 460 feet. A blind lead 12 feet wide with well-defined walls has been crossed. Samples assayed \$7 gold, 20 ounces silver and 2% copper. Drifts will be run on the lead.

R. W. Parry of Reno has received orders from J. T. McCarran, vice-president of the Empire M. Co. of New York City, directing him to send men to the Pyramid mine to resume work.

Dr. W. H. Patterson of Reno has bought the V claim, adjoining the Franco-vich Piazza mining property in Olinghouse canyon, paying, it is said, about \$3000 for it. It is understood that the doctor will develop the property.

NEW MEXICO.

GRANT COUNTY.

The Clifton C. Co. has made a strike in its Wildcat mine in Santa Rita district on the 160-foot level south, where it cut an intersecting vein, showing a solid body of sulphide ores of satisfactory character and values. The 100-ton concentrating plant is now under construction and will be completed by August. It is the intention of the company to sink a double-compartment shaft, through which the ore for mill will be hoisted and delivered directly into the ore bins at the mill by gravity.

The Silver City reduction works will put in a new furnace of 200 tons capacity. The three furnaces in operation at present treat eighty tons each.

The Pinos Altos M. Co. is making extensive improvements at their Gillette shaft. Their concentrator will be enlarged to nearly double the present capacity.

The Gopher mine at Pinos Altos is being pumped out and put in shape for examination by experts.

RIO ARriba COUNTY.

The air compressors and steam pump are now being installed on the Strawberry claim in the Bromide district, owned by the New Mexico G. & C. M. Co.

The Burnt Mountain M. Co. and the St. Michaels M. & R. Co. have consolidated, the new company taking the name of the latter company. It owns eight claims in Bromide district.

The Pontiac M. & M. Co., owners of the Independence group, are ready to start work. A 100-foot shaft will be sunk on the Independence claim. A mill site has been located on Tusas creek.

The Admiral G. & C. M. Co. will resume work soon with increased hoisting facilities.

OREGON.

BAKER COUNTY.

C. Glass and J. W. Witherop, who recently bought the Orofino, near Sumpter, are planning the immediate installation of a large machinery plant for deep development, and are also considering the erection of a 20-stamp mill. A mill test of eight tons gave \$80 per ton in free gold alone.

JACKSON COUNTY.

The Clio M. & M. Co., operating near Jacksonville, has been reorganized under the management of R. A. Parker, M. E., of Boston, Mass. J. E. Potter, the former manager of the mine, has sold his interest in it to the present company. The mill was started on the 5th inst.

C. Linder, the electrician and promoter of the new electric power plant at Jacksonville, will start the preliminary surveying at once.

The Republican 10-stamp mill is running and the Willette Co. will start up its mill shortly.

The Shawmut Co. are to begin grading for the 100-stamp mill.

The people who have the Felecia mine bonded are sinking a shaft and getting some rich ore.

T. W. W. Jacksonville, June 6.

JOSEPHINE COUNTY.

W. H. Dana, of the Copper Stain mine on Mt. Reuben, near Grants Pass, says a number of men are engaged in sinking on the vein in this mine.

W. Kramer of Galice creek took \$700 gold from a fifteen days run with an arrastra in his quartz mine.

C. B. Beardsley of Chicago, of the Old Channel M. Co., is at Galice, where the company is engaged in making the final cleanup for the season. The mine this year has been worked on a more extensive scale than ever before.

WASCO COUNTY.

A contest for the possession of the Oregon King gold mine at Ashwood is on trial

at Portland. The mine is in the south-eastern part of the county and is the only one in the locality. The country rock formation of basalt is here thin, and a porphyry dike carries the pay rock which has made a mine said to be worth a half million dollars. The present owners in possession, C. M. Cartwright & Co., have been operating the mine for two years past, spending, it is said, about \$50,000. They have blocked an ore body 8 feet thick, carrying gold, silver and copper values that average \$150 to the ton. A Mr. Brown is contesting for the mine on the ground of prior location.

SOUTH DAKOTA.

PENNINGTON COUNTY.

The Belt Dev. Co., at Deadwood, is down 300 feet in the main three-compartment shaft and sinking is advanced at the rate of 4 feet a day. Within six months it is expected to complete 800 feet depth, which will be the fastest shaft-sinking time made in the Black Hills.—The Hidden Fortune Co. has planned to invest upwards of a million dollars in development work and mills, and by the end of the year the district will furnish work for an additional population of 2000.

UTAH.

BOX ELDER COUNTY.

The Evanston M. & M. Co. has incorporated; capital \$50,000. J. Williams is president, and H. B. Stratford secretary. The company owns the Superior and other mining claims in the Promontory mining district.

The Burton M. Co. has incorporated; capital \$20,000. E. F. Squires is president, and J. W. Smith secretary and treasurer. The company owns the Blue Ribbon group in Park valley.

JUAB COUNTY.

Prof. C. Butters believes the low-grade siliceous gold ores of Tintic can be treated profitably. The owners of some of the mines have tried to mill the low grade, but the best results have been unsatisfactory. It is said that Prof. Butters has expressed a willingness to erect a large-tonnage custom mill in the Tintic district.

UTAH COUNTY.

The Wasatch G. M. Co. has incorporated, capital \$5,000, to develop claims 3 miles east of Ogden. C. A. Zimmerman is president, and J. J. Brummit secretary.

The American Fork M. Co. has incorporated; capital \$30,000. M. Friedel is president and L. C. Hickok secretary and treasurer. The company owns the Healey, Silver King No. 2 and Snowstorm mining claims in American Fork mining district.

WASHINGTON.

A stampede of oil land locators is being made, with the result that 120 oil land leases have been filed at Port Angeles within a few days. The property involved is located in the western part of Chatham county and along the ocean beach between Lapush and Neah bay. Two companies, one headed by A. Behrens of Tacoma and the other by J. W. Young of Seattle, had previously secured by lease and purchase about 6500 acres of the land said to show the strongest prospects in seepages.

FERRY COUNTY.

Prospects in Meteor show increased values as greater depth is attained. A recent assay on the Montana, owned by Pea & Co., gave over 1600 ounces silver and \$21.70 gold.—The Horseshoe and the Good Luck, owned by Millikan & Campbell, shows better in the shaft. The ore taken out carries bromides and assays over \$200 in silver and gold.—On the Stray Dog and the White Swan work is being pushed with two shifts.—A small fraction called the Ireland, lying close to the northwest corner of the Meteor, sold first for \$25, inside of a week it sold again for \$300, and the present owners have refused \$1500 for it.—The townsite on Nez Perce creek, about 1 mile southwest from the Meteor, has been named Sylvanite by the promoter, L. Finnegan, formerly of Republic. Northwest of the Meteor mine is another townsite, located by Reddin & Wilson of Rossland, and named Meteor.—A party of Colville men have employed surveyors, armed with revolvers, to survey around the leading properties for fractions. They have a triangular fraction lying between the side lines of the Meteor and the Alamo, for which they ask only \$50,000.

Supt. W. H. Kells of the Trade Dollar, at Republic, says the two-compartment shaft is down 120 feet and the ledge has been cut.

The placers near Republic continue to pay well. Considerable difficulty of working is encountered from the light fall of the drainage and depth to bedrock, influx of water on the latter being controlled with difficulty under present working conditions without machinery.

The Cold Spring group in Meteor has

been sold by B. Stensger and W. P. Foster to J. H. Young, O. J. Smith, E. M. Hodgson, B. C. Gregory, C. C. Caruthers, A. J. Lee and W. B. Dingle, all of Colville, for \$10,000. The new owners will sink a shaft 200 feet.

The Republic & Grand Forks R. R. Co., a corporation independent of the other railroad systems of Washington and British Columbia, has just let a contract for the immediate construction of the road bed and track from Grand Forks, B. C., to Republic, Wash., to G. S. Deeks & Co. The road will be about 46 miles long and the contract calls for completion ready for equipment Nov. 1 of this year. Men have commenced clearing the right of way and it is expected 1000 men will be at work by July 1 and 2000 by Aug. 1. T. W. Holland is the general manager, secretary and treasurer of the road, with headquarters at Grand Forks, and W. E. Morris of Republic is assistant manager and general counsel. The company have two-year contracts for ore transportation from many Republic companies and for smelting. They propose to build a 500-ton smelter at Grand Forks at once.

JEFFERSON COUNTY.

G. White of Illinois and L. Baumgarten and J. Gallagher of Chicago have been exploring in the Olympic mountains since March. They brought out samples of coal and copper, but would give out no information, and have returned to Chicago. It is said they will organize a company to develop their discoveries.

OKANOGAN COUNTY.

Placer gold has been found in paying quantities in the gulches and creek bars at Loomis. It is claimed that 75 cents was obtained from one pan and the ground is being carefully prospected.

STEVENS COUNTY.

Work is progressing on the Silver Knight, 15 miles southeast of Northport, on the North Fork of Deep creek, and a large body of low-grade copper-gold ore lies at the bottom of the 60-foot shaft. L. L. Tower, an owner in the claim, says that the Silver Knight has the largest body of low-grade ore to be found this side of Rossland. At present seven men are employed sinking a 100-foot shaft.

WYOMING.

CARBON COUNTY.

A strike of copper has been made on the eastern slope of the Sierra Madre mountains, near Saratoga. H. F. Forrest says that the discovery is a copper-bearing vein running a little south of east for miles and estimated to be more than 40 feet wide. Several claims are located and have been worked for some time. The Black Diamond, the Syndicate, the Octavia and the Cuprite are located on this vein, and all show good bodies of ore.

FOREIGN.

BRITISH COLUMBIA.

The Ben d'Or mines, situated on Cadwallader creek, about 70 miles from Lilloet, are reported sold to New York people for \$750,000 on an eighteen months' working bond, first payment, \$125,000, on June 25. The Ben d'Or has shipped bullion regularly. Recent development work shows large bodies of free milling gold ore.

The Old Gold, Lardeau, is to be opened up by J. W. Westfall of Trout Lake.

Free milling gold ore is being found at a number of points in Lardeau district. The Eva group is located in this free gold belt and until the Eva was proven there was little prospecting done for free gold.

The tunnel on the Highlander mine, Ainsworth, has entered the vein at a depth of 900 feet.

The tunnel on the Estella and Rover in the East Kootenay is now in between 600 and 700 feet. At 260 feet a crosscut shows 12 feet of ore. A second crosscut has 11 feet of ore and a third has about 7 feet. Stopping has been commenced.

Nelson, June 6, 1901.

A rich strike on the Wyoming mine at Sandon, operated by the Ruth M. Co., an English organization, is reported. The ore is silver-lead, assaying very high.

A strike of placer gold has been made in Franklin camp, not far from Grand Forks. The strike was made by J. W. Bartlett and C. H. McDonald, who own a ranch there. The gold was found while digging a post hole on the banks of Franklin creek. They noticed that the gravel carried gold and panned out several dollars' worth of dust, which is coarse and sharp, showing that it had not traveled far.

After long idleness the Fisher Maiden at Silverton is again under development, under the direction of J. K. Clark. W. W. Greenwood and F. Watson are much pleased with the prospects. The former states that they recently made a shipment

of two tons to Montana smelters, with satisfactory results.

The American government boundary line surveyor, Mr. Sinclair, determining the line in the Mt. Baker district, found it 3840 feet farther south than had been supposed. Two thousand feet of two of the most valuable mines in the district—the Golden Chariot and the Golden Star—owned by Seattle and New York people, were determined to be in Canada. Canadians jumped all this ground, claiming it had not been staked according to Canadian regulations and was not recorded. Americans assert that the claims were re-located under Canadian law when the question of boundary first came up.

According to the official report of Bernard McDonald, the Rossland manager of the Le Roi, the shipments for April averaged \$12.76 a ton, an increase of \$2.40 a ton over the values for March. On the estimated cost of \$10.32 per ton for mining and treatment the profit would be \$2.44 a ton, and on 21,066 tons shipped it would be approximately \$51,401.04. The shipments of the several mines managed by B. McDonald for April were: Le Roi, 21,066 tons, yielding 8252 ounces gold, 14,205 ounces silver, 261 tons copper, of a total estimated value of \$268,830. Rossland Great Western returns from ore shipped during developments to date were 3461 tons, yielding 1071 ounces gold, 2706 ounces silver, 54 tons copper, of a value of \$55,690. Le Roi No. 2 shipped 4469 tons, yielding 1798 ounces gold, 6389 ounces silver, 98 tons copper, valued at \$74,670. The average value of Rossland Great Western ore since shipments were commenced has been about \$16.10. The average value of Le Roi No. 2 shipments for April were about \$16.75.

MEXICO.

In the Prieto mine of La Dura M. Co., at La Concentracin, across the Yaqui river, in the northwest corner of the Alamos district, a body of very rich ore has been developed in the bottom of the mine. To develop and work it a new three-compartment shaft will be sunk to a depth of 1200 feet. G. Sincos and F. Leshar have gone out from Minas Prietas to contract the work of sinking.

The Richfield M. Co.; J. A. Cooper manager, have bought the Nacimiento and La Llave claims, near Tuape, Sonora. Men have been put on development work, and a mill will be erected to reduce the ores.

It is reported that the Los Bronces coal fields, Sonora, have been sold to an English syndicate for \$125,000, gold. Nacosari people are said to be interested, and the road now building out to Nacosari will be extended to Los Bronces to supply the reduction works of the Moctezuma Copper Co. with fuel.

THE KLONDIKE.

F. Berry and T. Lloyd are said to have an option on J. Hall's half interest in No. 17 El Dorado. The provision is made that the option is not to be taken advantage of until after the present cleanup. Mr. Lloyd is manager of Mr. Hall's interest in No. 17, which is owned jointly by Mr. Hall and N. E. Picotte.

The long-brewing war against concessions in the Klondike has opened against the big grants. Suit has been filed in the Gold Commissioner's Court against the Doyle concession on Bonanza, and against the Matson concession. A third suit is also to be brought against the Matson concession. The Bronson & Ray concession on lower Bonanza and several other concessions are to be attacked by suit.

THE TRANSVAAL.

It is reported that the British Government has decided to levy \$250,000,000 on the Transvaal gold mines, to pay half the cost of the Boer war. Sir David Barbour, formerly Finance Minister for India, who was commissioned to report upon the taxable capacity of these mines, advised Colonial Secretary Chamberlain to levy \$175,000,000; but Chamberlain, after consultation with Lord Milner, increased the maximum to the amount stated.

Catalogues Received.

THE Racine Boat Mfg. Co. of Racine, Wis., has issued a beautifully illustrated catalogue of the many types of vapor launches, sailboats and rowboats manufactured by them. The text information given is so attractively expressed and up-to-date that it will make at least a fresh water sailor out of the most timid landsman. Mining in southeastern Alaska is very largely a matter of boat transportation, and it is certainly worth the while of any intending prospector to have the information this catalogue gives. It can be obtained either by writing to the head office or to Baker & Hamilton, Pacific Coast agents, San Francisco, Cal.

THE Rockwell Engineering Co. of 26 Cortlandt St., New York, has issued Cata-

logue B, "Fuel Oil for Boilers." It has 16 large pages of illustrations and explanatory text devoted to the special appliances manufactured by that company for the use of petroleum fuel. The catalogue, which can be obtained by writing to the company, will answer many questions that will suggest themselves to the operators of steam plants considering the change from coal to petroleum fuel.

Personal.

LOUIS C. KELSEY has been elected city engineer of Salt Lake City, Utah.

C. L. CRANE has been appointed Supt. Reno Star mine, Bryan City, Nev.

HOWARD WELCH has been appointed mine inspector of coal mines of Montana.

RICHARD H. PARKER of Boston, Mass., was in San Francisco a few days last week.

HENRY B. KAEDING is chemist for the Oriental Con. M. Co., at Tai Bawoie, Korea.

F. L. SIZER, M. E., is manager Rosario Mines, Ltd., of Guadalupe y Calvo, Sonora, Mexico.

C. H. KAYSER has been examining mines in Lander and Nye counties, Nev., for Eastern people.

H. VINCENT WALLACE of Bakersfield, Cal., is at Altar, Sonora, Mexico, as Asst. Supt. Veta Grande M. Co.

M. M. O'SHAUGHNESSY, consulting engineer, of San Francisco has gone to Honolulu on a short professional visit.

H. H. NEWBY of San Francisco has resigned as Supt. of construction of the Bi-metallic dam, at Georgetown Flats, Mont.

THEO. F. VAN WAGENEN of Denver, Colo., is engaged in extended mine examinations in the vicinity of Lovelocks, Nev.

A. HAUMAN, M. E., will shortly return to San Francisco from a professional stay of some months at Las Animas, Sonora, Mexico.

J. H. STRITE, late of Redding, Cal., is in charge of construction of a large concentration plant for the Irondale Lead Co. at Irondale, Mo.

J. D. HELM, manager of Guggenheim smelters in the State of Chihuahua, Mexico, has been sojourning in San Francisco for several days.

EUGENE BIDDISON of Pueblo, Colo., has accepted the superintendency of the Arizona & Sonora Mfg. Co., who are erecting a plant at Nogales, Ariz.

Commercial Paragraphs.

THE Ludlow-Saylor Wire Co. of St. Louis, Mo., has filed an application for an increase of its capital stock from \$100,000 to \$300,000. The assets of the company are \$425,004.80 and its liabilities \$95,671.99.

H. D. CRIPPEN, manufacturer, of 52 Broadway, N. Y., has recently made export shipments of twelve Jackson hand power rock drills to a mining company at Chimbote, Peru, five to Mexico and four to Japan.

THE city of Boise, Idaho, has expended \$100,000 for improvements, including paving, sewer system and other work. The work has proceeded under the directions of City Engineer E. G. Eagleson.

All visitors to the Pan-American Exposition interested in pipe wrenches should not overlook the exhibit of the Atlas Pipe Wrench Co. of New York and San Francisco, section 34, Machinery Building. A photograph of the exhibit appears on this page. All sizes of the "Atlas" are on exhibition, and attendants are constantly on hand to demonstrate the superiority of the tool. From the number of orders for wrenches received from every section of this country and Europe the Atlas' popularity appears to be well established. *

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JUNE 4, 1901.

675,808—TYPEWRITER—J. F. Ames, Portland, Ogn.
675,808—MINING MACHINE—F. Ausser, S. F.
675,436—LEADER INDEX—V. C. Brook, Ogn.
675,507—SOLDERING MACHINE—W. S. Case, Hayward, Cal.
675,508—FLOATING FISH TRAP—G. Dean, Samish, Wash.
675,440—SASH PULL—H. W. Downing, Oakland, Cal.
675,472—QUARTZ MILL—A. Ford, Golden Gate, Cal.
675,470—THREAD HOLDER—Stella W. Hart, Los Angeles, Cal.
675,698—CHURN—A. Haworth, Hillsboro, Ogn.
675,481—SACKING DEVICE—C. F. & A. C. Jacobson, Berkeley, Cal.
675,490—ROCK DRILL—C. T. Litchfield, Spokane, Wash.
675,514—GOLD SAVING APPARATUS—A. W. Lockhart, S. F.
675,515—BAND CUTTER—C. A. Long, Pomeroy, Wash.
675,491—FLUSHING TANK—Thos. Mann, Portland, Ogn.
675,521—ROTARY ENGINE—J. D. McFarland Jr., Portland, Ogn.
675,756—CIGAR—M. Reinstein, Portland, Ogn.
675,792—PENHOLDER—F. Rench, Colton, Cal.
675,644—STEERING DEVICE FOR MOTORS—A. C. Stewart, Santa Paula, Cal.
675,503—SPIRIT LEVEL—C. M. Verrill, Oakland, Cal.
34,631—DESIGN—H. P. Koster, Los Angeles, Cal.
34,602—DESIGN—M. Reinstein, Portland, Ogn.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPIRIT LEVEL.—No. 675,503. June 4, 1901. C. M. Verrill, Oakland, Cal. This invention relates to improvements in spirit levels, and it consists of a sleeve having holes at opposite sides of its periphery, exterior cap pieces into which the ends of a tube extend and are secured, a circular flange is formed at right angles with one end of the sleeve, a body having a hole bored therethrough and a countersink to receive the sleeve and its flange, and conical counterbores formed axially with the sleeve from opposite sides of the body, with similarly shaped disks fitting the counterbores having short flanges extending into the ends of the sleeve.

FLUSHING TANK.—No. 675,491. June 4, 1901. T. Mann, Portland, Or. This invention relates to an improved tilting flushing tank. It consists of one tank contained and pivoted within the other, means by which the exterior tank may be tipped and discharged of its contents, and automatically righted and filled.

ROTARY ENGINE.—No. 675,521. June 4, 1901. J. D. McFarland Jr., assignor of one-half to J. Bruckman, both of San Francisco, Cal. The device consists of a wheel having a closed disk forming one side, a series of radially disposed cylinders cast integral therewith and bored out, pistons movable in the cylinders, bent or crank-shaped piston rods, one arm of which extends through the cylinder and connects with the piston, and the other lying parallel therewith but outside of the cylinder connects with the crank by means of an intermediate connecting rod or pitman. In connection with this are ports connecting with the opposite ends of the cylinders and valves movable over the ports so as to alternately admit and exhaust the impelling medium from the cylinder.

CAN SOLDERING APPARATUS.—No. 675,507. June 4, 1901. W. S. Case, Hayward, Cal. This invention is applied to the soldering of the end seams of rectangular cans having a greater dimension in one direction than the other, and it comprises a mechanism by which the cans are delivered from the feed or supply chute to holders adapted to receive and carry the cans, and by which the cans are transferred so that the edges will be successively dipped into the solder bath and remain a sufficient length of time, and mechanism by which the cans are rotated at stated intervals so that each edge is submerged in the solder while the can is passing the length of the bath. Endless traveling chains carry the can holders and move them successively over the solder bath.

SACKING DEVICE.—No. 675,481. June 4, 1901. C. F. and A. C. Jacobson, Berkeley, Cal. This apparatus is designed to hold sacks while they are being filled. It includes a base, a vertical standard, a frame guided on the standard and composed of divergent bars, a support for the frame, rock shafts parallel with the divergent frame bars, pins guided thereon and connections between the pins and the rock shaft, and means by which the rock shafts operate in unison, and means for locking the shaft in one direction and a counterweight for moving them in the opposite direction.

GOLD SAVING APPARATUS.—No. 675,514. June 4, 1901. A. W. Lockhart, San Francisco, Cal. This invention is designed to separate gold from gravel and pulp with which it may be associated. It consists of an enclosed, inclined rifled sluice through which the gravel and pulp are forced to travel upwardly and through the sluice and its extensions, an endless chain conveyor or excavator operating in relation to the position of the sluice, a support for the mechanism and means for adjusting and operating the various parts thereof.

TYPEWRITING MACHINES.—No. 675,806. June 4, 1901. J. F. Ames, Portland, Or. This invention consists of the formation of certain words which are most often used in the construction of sentences upon blocks or bodies which carry the whole word and in the union of a plurality of such words upon one block, with means to bring either word into the line, so as to form the impression thereof when the key is struck. In conjunction with this is employed mechanism by which an additional spacing device is brought into operation, whereby the carriage is advanced a distance equal to the amount of space occupied by the word, which may be two, three, four or more letters, so that the parts will be in position for the use of the next single letter or complete word, as the sentence requires.

As An Investment.

The 50% of your oil bills that you save when you install a

Cross Oil Filter

looks like money well invested. We guarantee the saving. We send them on 30 days' trial; send them back at our expense if not all we claim.

THE BURT MFG. CO.,
Akron, Ohio, U. S. A.
Largest Mfrs. of Oil Filters in the World.
We also make the BURT EXHAUST HEAD.

SITUATIONS WANTED.

SUPERINTENDENT of gold mine or mill desires position. Thoroughly experienced in mining and milling gold ores. Compete t assayer, chemist and surveyor. Technical graduate. Salary moderate till ability is demonstrated. Address B. Sc., care this paper.

POSITION in charge of a gold mine or mill desired by a graduate Mining Engineer, who is thoroughly experienced in mining and milling gold ores as practiced in this country and Mexico. Can assay, survey, manage men. etc. Will accept a percentage of profits in a good company for part salary. Address "Engineer," care Mining and Scientific Press.

ASSAYER, BOOKKEEPER, TYPEWRITER and General Office Man desires a situation. Ten years' practical experience. Best references given. Address A. Sayer, care of Mining and Scientific Press office.

WANTED.—Position as Superintendent. Eighteen years' practical experience in the West. Understand the mining and milling of ores for profit. Best of references. Address "Practical Miner," care Mining and Scientific Press.

Experienced Amalgamator WISHES POSITION. References furnished. Address V. D., care of Mining and Scientific Press.

Foreman Copper Smelter, with company smelting several hundred tons daily, would like to make a change of location. Understands every detail of the business. Address "Matte," care Mining and Scientific Press.

PRACTICAL SMELTERMAN, who had experience with sulphide and carbonate copper and lead ores in California and Mexico, competent to design or take charge of smelter, wants responsible position as chemist, furnace boss or superintendent. Address "Metallurgist," care Mining and Scientific Press.

A YOUNG MAN, having taken a course in surveying, including practical field and office work, wishes position as chairman or work in any capacity with a surveyor, civil or mining engineer. Address M. S., Box 10, Standish, Cal.

WANTED.

WANTED—FOREMAN experienced and handy about mine and mill and mining machinery. State age, experience and salary desired. Address "Quartz Mine," care of Mining and Scientific Press.

WANTED.—PROPERTIES CONTAINING MAGNETIC Pyrites or Sulphurals by parties who mean business. Address samples and particulars to Dr. Beecher, Oliver House, Corner Mason and Pine Sts., San Francisco, California.

Wanted, A Telephone Franchise in a live Western town. Anyone knowing of such a town in need of a telephone exchange will confer a favor by addressing "Telephone," care Mining and Scientific Press.

WANTED. Developed and Partly Developed Gold and Copper Mines.

Full expert reports, maps and 90 days' exclusive options must be furnished. Have CASH CUSTOMERS for worthy properties.

L. W. TULLEYS, COUNCIL BLUFFS, IA.

THE COLORADO MIDLAND RAILWAY

Reaches the Grandest Scenery in the World:
Ute Pass, Hagerman Pass, Hell Gate, Pike's Peak, Mount Sopris, Mount of the Holy Cross.
The Most Beautiful Summer Resorts in Colorado:
Manitou, Cascade Canyon, Green Mountain Falls, Woodland Park, Glenwood Springs.

The Most Famous Mining Camps:
Cripple Creek, Victor, Leadville, Aspen, C. H. SPEERS, Asst Gen. Pass. Agt., Denver, Colo.

DEWEY, STRONG & CO.,
Patent Agents, S. F., Cal., and Washington, D. C.

FOR SALE.

FOR SALE.—1200 feet of 12-in. Steel Pipe, No. 14 gauge, in good condition.
Inquire PORT COSTA WATER CO., 328 California St., San Francisco, Cal.

Valuable Hydraulic Mining Property, located in Plumas County, Cal., containing 273 acres, title U. S. patent, water rights, ditches, etc., FOR SALE AT A BARGAIN. Terms easy. For further particulars, apply to ALMARIN B. PAUL, 27 Crocker Building, San Francisco, Cal.

Valuable Gold-Copper Property, 5 Miles from Callahans, Siskiyou Co., for Sale.
38 tons shipped to Selby's went 18% copper, \$6 gold and silver. 136 tons shipped to Kewick went \$1800 copper and gold. Shaft 40 feet. Other development work. Good road. Abundant water and timber. B. K. COLLIER, Etna Mills, Cal.

FOR SALE.

ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

SECOND-HAND MACHINERY.

PULLEYS, SHAFING, BELTING, BOXES, BOILERS, ENGINES, HOISTERS, STAMP MILLS, RAILS, CABLE—all but little used.

THE S. S. MACHINERY CO.,
Sixth and Market Sts., DENVER, COLO.
SEND FOR DESCRIPTIVE CIRCULAR.

Attention of Mining Men

and others is invited to the
DEAN-OVIATT ORE ROASTER AND
DESULPHURIZER.

WELL WORTH YOUR INVESTIGATION!

P. O. Box 700, Nelson, British Columbia.

WE BUY very rich Ores, Dental Scrap, Tellurium Ores, Mill Wastes, Jewelers' Sweepings, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.
A. M. DONALDSON & CO.,
ASSAYERS AND WASTE PRODUCT SMELTERS,
1661 Larimer St., Denver, Colo.
Donaldson's Assayers' Slag Hammer {1lb. \$1.10
11lb. 3oz. \$1.25

ARE YOU GOING EAST THIS SUMMER?
If you are going to the Pan-American Exposition at Buffalo, or to Cincinnati, Detroit, Chicago, Milwaukee, or any point in the East, write or call upon Mr. D. W. Hitchcock, General Agent Union Pacific R. R. Co., No. 1 Montgomery St., San Francisco, in regard to reduced round trip rates to these points. Three trains via this route leave California daily. The time of the "Overland Limited" to Chicago is less than 3 days and to Buffalo 3½ days, which is nearly a day quicker than any other line.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from A. Lundberg, in the Joseph Thomas Mine, at Plymouth, Amador Co., to deposit tailings in Indian Creek, and from S. L. Simmons et als., in the Victor Placer Mine, in Negro Canyon, Sierra Co., to deposit tailings in Charcoal or Negro Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on June 24, 1901, at 1:30 P. M.

WILLIETTA MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of June, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 8, 206 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

FRANK E. CORDES, Secretary.
Office—Room 8, 206 Sansome street, San Francisco, California.

SMELTER PLANS.

F. D. BAKER, Mech. Engr., DENVER.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

THE S. H. SUPPLY CO.,

THE MACHINERY DEPOT OF THE WEST,

22d and Larimer Streets, DENVER, COLO.

During the past three months we have dismantled three mills: the Royal Gorge Mill, Canon City; the Oneida Reduction Works, Victor, Colo., and the Gold Brick Mill at Gunnison, Colo. The first of these was in actual operation less than thirty days; the second, ninety days, and the third one year. In all of these mills amalgamating machinery was used, and the consequence is that we have a great assortment of this class of machinery. For use it is as good as new in every respect. We are offering this machinery at a saving of from 50% to 75% over the cost of new machinery. We have:

14 Standard Amalgamating Pans.
7 8-Foot Settlers.
4 Cleanup Pans.
8 Amalgam Safes.
15 Quick Elevators.
4 Amalgam Cars.
5 Quick Tanks.
3 Retorts and Bullion Furnaces.

Two of these mills were dry crushing, containing the following roasting and drying machinery:

Howell Improved White Roasting Furnace (60x37).
3 18-Foot Revolving Ore Dryers.
1 Bruckner Roasting Furnace.
1 40-Foot Pierce Roasting Furnace.

All of these plants were fully equipped with power, including Corliss engines (18x42); tubular boilers and Heime water tube boilers; feed water heaters, and pumps.

Thousands of feet of rubber and leather belting, shafting, pulleys and hangers are in our warehouses. Write for our prices.

The air compressors we have in stock and can make immediate shipment on, are:

12x14 Ingersoll-Sergeant.
16x14x10½ Norwalk.
12x14 Rand.
10x12 Knowles Belt Driven.
6x8 Knowles Belt Driven.

Our new catalogue is just issued and we will send you one if you ask for it. It contains a large amount of good information in regard to prices, as all of them are put in plain figures. No discounts. Send for it.

Ores Bought and Shipped

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/4" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : S. K. SNODGRASS, Denver, Colo. (The Windsor.)

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General
Arrangement
of
Pelatan-Clerici
Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

"THE DANIEL BEST" 50 Horse Power TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, **50 HORSE POWER.**

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

**THE Prescott and  
Eastern Railroad**

ENTERS AN

Extremely Rich Mining Country.

The opening of this road makes easy of access  
one of the Richest Gold and Copper Mining Dis-  
tricts in the World. Hundreds of prospectors are  
turning their attention to this section.

Take the Santa Fe System to Ash Fork, thence  
via the SANTA FE, PRESCOTT & PHOENIX RY.  
to Prescott. This latter road also reaches Wicken-  
burg, where is located the great Vulture Gold  
Mine and where the recent marvelous gold strike  
was made in the Oro Grande.

For further information and descriptive litera-  
ture, address H. P. ANEWALT, Gen. Frt. & Pass.  
Ag't., PRESCOTT, ARIZ.

**The State Ore Sampling Co.**

DENVER, COLO.

We buy Gold, Silver, Lead, Copper, Bismuth,  
Uranium, Wolframite, Cobalt, Molybdenite and  
Antimony Ores. We have modern sampling mills,  
also test ore for the new processes of ore reduction.  
Our long experience in the market enables us  
to obtain the highest prices for all marketable  
ores. Write for our "Reference Book." Send  
analysis of your ore for prices and information.

BAILY &amp; MONNIG, Managers.

**Placer Deposits.**

Parties interested in placer deposits that cannot  
be successfully operated, owing to a lack of water,  
should communicate with THOMAS A. EDISON,  
Orange, N. J.

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B9 to

No. 1 Special Button Balance with 8-inch beam. Sensibility 1-200 Milligramme. For very accurate weighings. Among the well-known smelters using this balance are the following: GLOBE SMELTING & REFINING CO., Denver, Colo., U. S. A.; CANADIAN SMELTING WORKS, Trail, B. C.; MT. LYELL MINING & RAILWAY CO.'S Reduction Works, Pengshan, Tasmania.

For full description of this and other balances send for Catalogue A9 to

## POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.  
Send us your inquiries.

SEND FOR PAMPHLET.  
THE PNEUMATIC CYANIDE PROCESS CO., 306 Boston Bldg., Denver, Colo.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quick-silver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries. SEND FOR DESCRIPTIVE CIRCULAR.

# THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying; over 500 tons having been handled in ten hours time."

**MAIN BELTING COMPANY,**

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Old., N. C., says  
"Saves the minutest float Gold, and after 10 years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold really that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

**ASSESSMENT NOTICES.**

**MOHIOAN MINING AND MILLING COMPANY.**—  
Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1901, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 300 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 14th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. CLASSEN, Secretary.

Office—300 California St., San Francisco, California.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of May, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of July, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office—Room 801, Claus Spreckels Building, San Francisco, California.

**INYO MARBLE COMPANY OF CALIFORNIA.**—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of May, 1901, an assessment (No. 34) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of July, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 6th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 31, tenth floor, Mills Building, San Francisco, California.

**DELINQUENT SALE NOTICE.**

**OSCEOLA CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Plymouth, Amador County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 23d day of April, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

Names. No. Cert. Shares. Amt.

Pon Wand..... 51 250 12 50

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 14) levied on the 23d day of April, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

Names. No. Cert. Shares. Amt.

F. Struven..... 183 20 1 00

T. Vogel..... 227 150 7 50

And in accordance with law, and an order from the Board of Directors, made on the 16th day of April, 1901, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company No. 773 Mission street, San Francisco, California, on TUESDAY, the 25th day of June, 1901, at the hour of 1 o'clock P. M. of said day to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

**DELINQUENT SALE NOTICE.**

**AMERICAN OIL AND REFINERY COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Contra Costa County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 26th day of March, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

Names. No. Cert. Shares. Amt.

Allen, S. L..... 110 12 2 50

**The Putman Boots**

Embody everything that is practical in Sportsmen's Footwear. For nearly a quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot, (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, turned with the grain of the hide left on (our special tannage) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Seamed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for **\$7.50**. Send for order blank showing how to measure your foot.

**H. J. PUTMAN & CO.**

# THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY, SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

Yours truly, JOHN ROSS JR., Superintendent.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

Yours truly, EUGENE MAY, Foreman.

For any information regarding Frue Vanner or Belts, call on or address

## Anaconda Self Oiling Axles FOR MINE CARS.

Over 5000 cars equipped with these axles are being used by the Anaconda Copper Mining Co. in Montana, and large numbers are in use at other mines in the Western States. Axles are made to suit any gauge from 18-inch to 40-inch. Wheels of any type or size can be supplied. The wheel usually furnished is 12-inch in diameter with chilled tread, of form as shown in cut.

## Concentrates.

THE Bessemer limit of phosphorus for 50% iron ores is .05%. More than this renders the ore unsuitable.

THE solidity of a ring equals thickness plus inner diameter, multiplied by square of the thickness, multiplied by 2.4674.

OXYGEN is liquefied at  $-182.6^{\circ}\text{C}$ ., air at  $-193.9^{\circ}\text{C}$ ., and solidifies at  $-214^{\circ}\text{C}$ ., and hydrogen is liquefied at  $-238.9^{\circ}\text{C}$ .

A NEW artificial abrasive, it is understood, is to be made in an electric furnace at Niagara by the fusion of corundum.

THE Calumet & Hecla mine, including the declared dividend, has paid to its stockholders \$75,850,000. In all, 119 dividends have been paid.

IRON ORE containing more than 2% of manganese is undesirable for the manufacture of pig iron, but is well adapted for the making of steel.

AN examination of the black sand in the Atlin, B. C., district shows a large amount of fine gold. As is usually the case, it is found in the nonmagnetic portion of the sand after parting.

WIRELESS telegraphy is barely a commercially successful fact, yet it is reported that telephoning without wires and the electrical transmitting of pictures without wire is experimentally successful.

THE average cost charge per foot of bore hole drilled, for the carbons consumed, is 30 cents. This includes all kinds of rock except the extremely hard granites, the range of costs being from 20 to 70 cents.

FOR operating air drills, and for mine use generally, compressed air is used at from sixty to eighty pounds pressure to the square inch. There is a tendency developing from practice to use pressures up to 90 and 100 pounds pressure.

THE Liberty Hill hydraulic tailings dam was built in 1897 by the hydraulic method, described in this journal. Being intended for tailings, there was no sheet piling in the dam. The water flow was conducted past it by a spillway 40 feet wide.

THE Southwest Miners' Association will hold their annual meeting on July 9, 1901, in Los Angeles. It is said matters of great importance will come up for determination and members are requested by the directors to be present, if possible, otherwise to be represented by proxy.

TO FIND the H. P. required to pump water a given lift by a steam pump, multiply the total weight of the water to be lifted by the height in feet, divide the product by 33,000 and multiply the quotient by 1.5. The margin is required to compensate the water friction and losses of steam.

THE increasing export of tinplate from the United States, dependent now on import of the tin, will make tin mines within the United States increasingly valuable. The discoveries made in the Port Clarence district of Alaska are certainly worth testing for the development of minable deposits.

DR. VOGES, director of the National Board of Health at Buenos Ayres, is credited with the discovery that naphthalene neutralizes the poison of mosquito bites even where the spot bitten is considerably inflamed. If fresh bites are rubbed with the naphthalene, no swelling or inflammation follows.

THE commercial source of the precious emerald is Colombia, in South America, the particular locality being not far from Bogota, the capital. They are found also in Siberia and Hindustan, and some have been found in North Carolina. No precious emerald has yet been reported found in California.

THERE is no market in San Francisco for tungsten ores. Steel makers are the only people who are consumers to any extent. They will quote prices they will pay and advise if they have need of the ores. The quantity of tungsten steel used is not large, and recent discoveries of the ores are increasing the supply.

IT is customary in moderate sized veins to have the levels 100 feet apart. Unless there is some special reason for the change they should not be made closer. They can sometimes be made with economy 120 or even 150 feet apart. Station cutting and drift opening is much more costly than the same cubic opening in slopes.

EXPERIENCE with a steam shovel in mining iron ore in open cut in Georgia shows that five or six men with a steam shovel can do the same amount of work as fifty men with the pick and shovel, and do it much cheaper. It is claimed that iron ore can be mined, washed and loaded on cars all by machinery for less than 50 cents a ton.

FRENCH automobilists have found that the consumption of alcohol as fuel, if used mixed in equal parts with benzine, was at the same rate as when benzine alone was used; but, if the alcohol was used unmixed, twice the quantity as compared with benzine was required. Alcohol in France is cheaper than benzine, the latter costing about 40 cents a gallon.

THE applications from members and guests for the Mexican meeting excursion of the American Society of Mining Engineers already exceed the capacity of a single train, and an additional one with accommodation for eighty persons is to be provided. The secretary urgently

requests advice of intention to go from members at the earliest possible moment.

STEEL and concrete were the materials used in the construction of a submerged tunnel supplying condensing water to the power house of the New York Edison Co. The tunnel is 225 feet long, 12½ feet in diameter, weight 1200 tons, made with exterior and interior shells of ½-inch sheet steel, between which is 15 inches of concrete. The tunnel was built on land in a ship yard, launched and towed into position before being submerged.

A TELEPHONE equipment for a mine is a money saving investment almost regardless of the cost of installation. For a large mine it is a practical necessity, keeping all parts of the works in instant communication with each other. For a small mine the time of employees that it will save will pay the cost of an ordinary installation in a few months. Experience has demonstrated that it is an economy even in preliminary work and prospects.

THE factor of safety for boilers is higher than used to safely hold water pressures. For the latter 2 to 3 are safety factors in general use, but for boilers from 4 to 6. That is, the bursting pressure for the boiler shell is divided by not less than 4 to fix the allowable maximum boiler pressure. The United States Government uses 4 as the safety factor for its marine boilers, other boilers are rated with 5 as a safety factor. A well-made boiler is safe with either when new, but after ten years' use the factor is increased to allow for deterioration.

IT has been decided that no formal meeting of the American Institute of Mining Engineers will be held at Buffalo, during the Exposition. Members visiting the Exposition are, however, assured of a hospitable reception and special attention from Dr. David T. Day, superintendent of the Department of Mines and Metallurgy, and from the Engineers' Society of Western New York, which has invited all visiting engineers to its rooms, 965 Endicott square, where they can receive their mail and where the services of stenographers and guides will be available.

WHILE coal seems fairly abundant and well distributed in Alaska, transportation conditions will make it impossible in some localities. As a substitute for it, peat, which is more abundant than coal, can be used. The Swedish method of preparation consists in drying it by artificial heat, reducing the moisture to 15% and compressing it into briquettes. The peat is shredded before the application of the drying heat. The cost in Sweden, working a twenty-ton plant 300 days, is \$2.16 a ton. The labor costs are lower there than possible in Alaska. Allowing for this difference, the cost per ton there would be about \$12.

THE dynamite powder manufacturers all have special trade secrets which they use to modify the general type of process which is much the same with all of them. None of them have yet found a method of manufacture which is absolutely safe, or even safe at all. With the utmost care, and with the most perfect knowledge, accidental explosions are continually happening invariably with loss of property and all too frequently with loss of life. The handling of the powder after it is manufactured is hardly comparable for danger with the manufacture. Better pay the government tax on it than undertake its manufacture to beat the tax collector.

EPIGENETIC, as used in geology, is, according to the dictionary, the equivalent of metamorphism. Propylitization is undoubtedly a derivative of propylite, the youngest series of volcanic rocks, according to Richtofen. So considered, it would mean the state of being changed to an eruptive of this series. This literal meaning is not probably the meaning with which the word is used in all geological discussions in which it appears. Where the context and the dictionary fail to make clear the meaning of a geological term, recourse must be had to the geologist who used it, or, where it is an entirely new term, to the geologist who invented it to express his idea.

A "T" SQUARE, with a scale pasted on the working edge, with a datum line mark on the base edge of the triangle used with it, will be found to facilitate and lighten the labor of drafting very materially. The measurement of the spacing of lines on drawings is effected coincident with the ruling. It is not necessary to mark off the points in advance by prick points from a scale or by the use of a divider. For the use of a vertical scale it should be fastened or pasted, preferably the latter, on the edge of the drawing-board. The head of the "T" square is beveled down and a datum line is marked on the bevel so as to meet the edge of the scale. Paper scales for these purposes are satisfactory. It is also a convenience to have pasted on the top of the "T" square copies of frequently used formulas and tables.

SOME costs of diamond core drilling operations that are useful in estimating on prospective drilling are the following: Cost of twelve holes 200 to 800 feet deep, 5957 feet of boring, per foot, \$2.49; cost of eighteen holes, 5046 feet of boring, in northern Michigan, \$2.604 per foot; 7959 feet of boring, nearly all underground, \$0.884 per foot; six holes, 2626½ feet, \$0.986 per foot of boring; 296 feet of boring cost per foot \$4.322; eight holes, 2922½ feet, cost per foot \$1.324; nine holes, total depth 2091 feet, cost \$2.374 per foot; twenty-one holes, 4684 feet of boring, cost \$3.007 per foot; twenty-eight holes, 3746 feet, cost per foot \$1.195; 13,312 feet of boring cost \$0.733 per foot. Generally the cost is much less in working mines than in

purely prospecting operations. Superintendence, and in fact practically all charges except wages and diamonds, are averaged down when the drilling is part of the larger operations.

A PROCESS employed for waterproofing brick walls consists of two solutions applied alternately, one being of soap and water and one of alum and water. Dissolve three-quarters pound of soap in one gallon of water, and one-half pound of alum in four gallons of water. The first, or soap, solution should be at boiling point, and the walls clean and dry. Apply with flat brush, taking care to form no bubbles on surface of brick; allow the coat to remain twenty-four hours. Apply alum solution, which should be about lukewarm, and allow this also to remain twenty-four hours. Continue the operations alternately with the two solutions until the walls are found to be impervious to moisture. The alum and soap form an insoluble compound which fills the pores of brick and prevents absorption of moisture. Two coats of each solution is considered sufficient for brick walls under ordinary conditions.

TO CALCULATE pulley diameters and revolutions, the driving pulley being called the driver, and the driven pulley the driven, to determine the diameter of driver, (given the revolutions of driver and the diameter and revolutions of driven pulley): Diameter of driver = diameter of driven  $\times$  revolutions of driven  $\div$  revolutions of driver. To determine the diameter of driven (given the revolutions of driven and diameter and revolutions of driving pulley): Diameter of driven = diameter of driver  $\times$  revolutions of driver  $\div$  revolutions of driven. To determine the revolutions of the driver (given the diameter and revolutions of the driven and diameter of the driving pulley): Revolutions of driver = diameter of driven  $\times$  revolutions of driven  $\div$  diameter of driver. To determine the revolutions of the driven (given the diameter and revolutions of the driving and diameter of the driven pulley): Revolutions of driven = diameter of driver  $\times$  revolutions of driver  $\div$  diameter of driven.

FOR foundations for machinery, buildings and for floors, only the best brands of Portland cement should be used. The proportions may be as follows: One part of cement, three parts of clean, sharp sand and five parts of stone broken small enough to pass through a 2-inch ring. In preparing the concrete the sand and broken stone must first be washed clean. The three ingredients are then mixed and additional water added by a spray to make a pasty matrix, the whole being worked over and immediately deposited in place. It must be well tempered, and in heavy work the layers should not exceed 12 inches in thickness, which must be allowed to set at least twenty-four hours before the next layer is added. For one cubic yard of concrete made as above, there will be required one barrel of cement, one-half cubic yard of sand and one cubic yard of broken stone. Finishing the surface of floors one-half inch thick is done with one part of cement to two of fine, clean sand, the final surface being floated. For heavy work make the coat 1 inch thick. This last thickness for each square yard of surface will require .182 barrel of cement and .091 barrel of sand.

LARGE MASSES of the gold-bearing quartz conglomerate found on some of the island beaches of southeastern Alaska are not the auriferous quartz conglomerate mined in the Transvaal, and are not indicative of the existence in place of minable deposits of similar conglomerate. These float masses owe their origin to the existence of novel conditions. Examination will show the auriferous quartz to be partly in angular fragments and partly water worn. The cementing material is calcite, colored a dark brown by the oxidized iron pyrite originally present in the quartz. The country rock adjacent to the conglomerate boulders is a more or less pure crystallized limestone, containing gold-bearing quartz veins. The mode of formation of the conglomerate from the limestone country rock and its auriferous quartz veins was probably somewhat as follows: Geologically, the country rock appears to be subsiding from a condition of elevation much more considerable than at the present time. During this period of elevation surface waters formed open channels in the limestone, frequently directly underlying the quartz veins, and, oxidizing the pyrite in the quartz, broke it down from place and carried it down the steeper portions of the open channels or caves and accumulated it in the flatter places. The rounded, water worn character of some of the quartz indicates both volume and velocity to the old flows through these water channels, and it would seem that under such conditions the water did not become saturated with calcite in solution. Later, with subsidence and regional changes, the force and quantity of water flow becoming diminished, a condition of saturation of the smaller quantity of water with the calcite occurred and the latter became deposited in the interspaces of the quartz fragments, ultimately cementing them and closing the water channel. Coming by subsidence in reach of wave erosion, the quartz in the conglomerate, being harder, has protected the mass from disintegration after the enclosing limestone has been dissolved or eroded away. On the land surface the evidence of the phenomena described exists in still open caves descending below the sea level. The openings could only have been formed with drainage. These are found, in mine openings on the quartz veins, to contain large fragments of auriferous quartz, sometimes cemented together with calcium carbonate and sometimes in water worn boulders. Clear of the ledges are found, in places exposed by the surface erosion of ravines, masses of conglomerate identical in composition with the float masses found on the beaches.

## Leadville, Colo., Pumping Practice.

## PART II.

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

**PUMP DUTIES.**—It is exceedingly difficult to compare the efficiency of one pump with another owing to the different methods in vogue of stating the duties. Thus the duty reported of the pumps in Cornwall is stated in terms of the foot pounds of useful work done by a bushel of coal burnt (94 pounds of Welsh coal). In the Lake Superior district it is given in terms of the foot pounds of useful work done by 100 pounds of coal. To make confusion worse confounded, the pump makers are using a duty of so many foot pounds per 1000 pounds of dry steam. All these duties are of really very little value, since, if stated in terms of coal burnt, no real criterion is established owing to the variation of the quality of coal used. If stated in terms of dry steam used, then we have no means of knowing the efficiency of the whole plant, including steam line, boiler, etc. The American Society of Mechanical Engineers propose a new method of stating the duty, which is becoming largely adopted. This duty gives the number of foot pounds developed by the pump per million British thermal units furnished from the boiler. This gives an absolute comparison between different pumps. It is, however, yet defective, since this duty does not take into account the personal factor of the boiler attendants. The final duty should show the useful effect of the machinery and the men. The American Society of Mechanical Engineers' duty shows the effect, or economy, of the machinery only. I propose that—for mining pumps, at all events—the duty should be expressed in terms of the number of foot pounds developed by the pump per million British thermal units fed to the boiler in coal. It is obvious that this latter duty will enable a comparison between different pumping plants of which plants the men in charge form an essential part. Still, to enable a comparison to be made between Leadville pumps and those of other districts, the duty is expressed in foot pounds developed by 100 pounds of coal, by 1000 pounds of dry steam, by 1,000,000 British thermal units from the boiler, and by 1,000,000 British thermal units contained in the coal. A series of duty tests made on the compound, duplex, steam-jacketed Jeanesville pump at the Ibex mine at Leadville shows a very high duty for such a type of pump. The pump station is about 1000 feet underground and about 3500 feet from the boilers. The size has been given, viz., 15x28-inch steam cylinders, 38-inch stroke, 7½-inch plunger. It has a jet condenser, steam line 6 inches diameter protected by ½-inch asbestos paper, ¾-inch felt, ¼-inch paper, all covered with galvanized sheet iron, every joint of which was carefully soldered; water column, 13½ inches diameter. The elevation of the station above sea level is about 11,000 feet. The following average figures per twenty-four hours were obtained:

**Water Figures.**—Water delivered 65,733 gallons, head 1136 feet; water delivered 1,252,390 gallons, head 933 feet; total foot pounds, 10,358 million per twenty-four hours; total water delivered, 1,318,123 gallons by plunger displacement.

**Coal Figures.**—Coal burnt, 23,000 pounds; ash made, 2330 pounds = 10.1%; British thermal units in coal, 237.45 million.

**Boiler Figures.**—Steam pressure at boiler, 82 pounds; feed water temperature, 143° Fahr.; total water evaporated, 175,446 pounds; evaporation per pound of coal from 143° Fahr., 7.62 pounds; British thermal units supplied by boiler, 206.67 million.

**Condensation in Steam Line.**—Radiation surface of line, 2050 square feet; water condensed and caught in traps and separator, 9144 pounds; entrained water in steam sent to pump, 4989 pounds; total condensation, 14,133 pounds; total condensation per 100 square feet radiation surface, 689.4 pounds; dry steam supplied to engine, 161,313 pounds.

**Steam Cylinders of Pump.**—Dry steam supplied to air pump condenser, 9600 pounds; dry steam supplied to steam cylinders, 151,713 pounds; indicated horse power of engines, 261.4 horse power; dry steam used per indicated horse power per hour, including condenser pump, 25.7 pounds; dry steam used per indicated horse power per hour, not including condenser pump, 24.2 horse power; steam accounted for by indicator diagrams, 23.9 horse power.

**Pump.**—Useful work done by pump, 217.9 horse power; loss in friction, 43.5 horse power; total indicated horse power, 261.4.

**Recapitulation.**—\*Total steam used per pump horse power, 33.4 pounds per hour; dry steam used per indicated horse power, 25.7 pounds per hour; total steam used per indicated horse power, 27.9 pounds per hour; coal burnt per indicated horse power, 3.6 pounds per hour; coal burnt per pump horse power, 4.3 pounds per hour. \*Figured from water evaporated at boiler.

**Duties.**—Foot pounds of useful work per 100 pounds of coal, 45.0 million; foot pounds of useful work per 1000 pounds of dry steam, 64.2 million; foot pounds of useful work per American Society of Mechanical Engineers' unit, 50.2 million; foot pounds of useful work per million British thermal units contained in coal, 43.2 million.

This test shows that the duty of an underground pump 3500 feet from the boiler is not as low

as frequently stated. A number of useful facts can be obtained in addition—especially on the losses by radiation in the steam pipe. The tests show that the condensation per 100 square feet radiation surface shown by trapped water is 446.0 pounds per twenty-four hours; condensed water per 100 square feet entrained by the steam is 243.3 pounds per twenty-four hours; total 689.3 pounds per twenty-four hours.

\*Some tests made at the old Wolfstone shaft some years ago show that 585 feet of 4-inch steam pipe, covered with asbestos paper and felt, gave a loss of 8.369 cubic inches of water per 100 square feet of radiation surface per minute, which is equivalent to 436.4 pounds per twenty-four hours. In this latter test the water was trapped out, so that it compares with the figures given above, 446 pounds of water condensed per 100 square feet of 6-inch pipe. This latter figure may be safely used in calculating condensation losses, but it is necessary to allow 50% for the water entrained by the steam after leaving the separators or traps. The tests also show that when indicator diagrams are calculated out a very close

Diagram from H. P. Cyl. Ibex Pump, 16 Spring.

Diagram from L. P. Cyl. Ibex Pump, 40 Spring.

approximation of the water or steam used by the pumps can be found. When indicator diagrams are taken from condensing mine pumps both the main pump and the condenser must be indicated.

Tests of other big pumps could be given, but they would be a mere repetition of the above. The duty of the triple expansion pumps is from 10% to 20% greater than the compounds.

The cost of pumping is very variable, as is to be expected. The Downtown Pumping Association charges 10 cents per 1000 gallons pumped. The average depth of the pumping done by that association may be put at 600 feet. The cost on the basis used in city water works—1,000,000 foot gallons, or 1000 gallons raised 1000 feet—is in the association 16.6 cents per million foot gallons. It really does not quite cost this, but as the association is a mutual benefit affair no complaint is heard. The pumping plant of the Downtown Pumping Association is not up to date, but it gives a fair idea of the cost of pumping in the older mines. In the newer mines, using triple expansion engines, the cost may be put at 6.86 cents per million foot gallons. The cost in detail may be estimated as follows:

|                          | Cents per million foot gallons. |
|--------------------------|---------------------------------|
| Fuel.....                | 3.8                             |
| Labor.....               | 1.8                             |
| Management.....          | 0.6                             |
| Waste, oil, light.....   | 0.3                             |
| Taxes and insurance..... | 0.18                            |
| Interest on capital..... | 0.18                            |
| Total.....               | 6.86                            |

When sinkers are used these costs are not even approximate. It may be safely figured that the cost of operating a sinker is from 40 cents to 50 cents per million foot gallons.

The average cost of pumping in Leadville, including all operations, is as follows: (1) When a normal amount of prospecting is going on and few sinkers are at work the cost per million foot gallons is about 18 cents; (2) when a large amount of prospecting is going on and many sinkers are at work the cost is about 25 cents.

A feature of the camp not alluded to is the interdependence of the flow of water. For example, when the Valentine shaft reached a certain depth the flow

of water suddenly increased and the Penrose shaft went dry. When the Valentine suspended operations the Penrose had to resume pumping. These facts have become so obvious that the idea of association is gaining ground rapidly, especially as the present association is limited in its territory. It would be to the advantage of all if the association were widened and the expenses of pumping justly and equitably divided among the parties.

## The Lenora Mine, Vancouver Island.

Written for the MINING AND SCIENTIFIC PRESS.

Vancouver island, nearly 300 miles long and as much as 70 in width, settled at Victoria and in its vicinity at the southern end for over half a century, has only in the last few years been considered to be a possible metal-producing field. In the recent enlightenment by some large exploitations that are successfully productive, that this condition could have existed so long seems surprising.

The Lenora mine is on Mount Sicker, distant 40 miles from Victoria on the Esquimalt & Nanaimo railway; the mine is reached from Westholme station by stage or by the mine railway, the distance being about 6½ miles. It is owned by the Lenora & Mount Sicker Copper M. Co., of which Henry Croft, M. E., is the manager.

The mineral-bearing formation on Mount Sicker is a schist belt running nearly east and west and dipping 80° to the north. The width of the belt is about a mile and a half. The formation adjoining south is slate and north black shales and conglomerate. The schist is siliceous in character, more or less impregnated with calcite and talcose in structure. Porphyry dikes cut through it. The mineral-bearing character of the belt extends for many miles. Up to the present time its principal development is the Lenora mine.

The mine is situated at about 1400 feet above the sea level. The main vein is about 60 feet wide; the ore body runs from 20 to 35 feet in width; the main stope has eighteen floors; two tunnels have been driven at different levels, and a third one has been started, and will be run with a two-drill (Rand) compressor; this tunnel will run 1200 feet on the vein. A parallel vein was cut 30 feet in width and about north of the south vein 160 feet; the first assay in the vein went gold \$130, silver 696 ounces; copper 14%, or about \$525 per ton. On the next claim, the Tyhee, this same vein was lately struck in a crosscut and heavy free gold was found. The vein has been now proved at four levels.

The illustrations on the first page of this number show some of the surface improvements built along with the underground exploitation. The mine opening being by tunnel there are no costly machinery plants. The local timber furnished the lumber for the ore bins and sorting sheds. The principal problem, transportation, was solved by the construction of the narrow gauge railroad from the mine to Westholme station on the Esquimalt & Nanaimo R. R. At present ore is here transhipped and taken to Ladysmith, thence another handling and it goes to the smelter by steamer.

The Lenora railway is to be constructed to the sea at Osborne bay. Grading is already completed. The sea shipment from this point, avoiding the handling and second railroad shipment, will save \$2 a ton alone. The construction of a smelter at the seaport terminus of the railroad, arrangements for which have been made, will make a very considerable additional saving. The Lenora mine has shipped from March, 1899, to June 1st, 1901, about 14,700 tons of copper ore—chalcopryite—of an average value of \$20 per ton, being \$3.50 gold, \$2 in silver and \$14.50 copper. The net values realized on this after payment of smelting charges was \$200,314. On the second-class ore dumps there are at the mine about 15,000 tons averaging in values about \$12 a ton. This ore is reserved pending the construction of the smelter at Osborne bay. The output from now on will be considerably increased.

The successful development of the Lenora has been a stimulus to the exploration for other mines. Many other claims at Mount Sicker have been located and on some of them considerable development expenditure is being made. A mining town is springing up at the terminus of the railroad that is so new that stumps of the timber are not out of the streets yet. Natural conditions favor successful exploitation in the district. The mining is by tunnel. Transportation costs are at a minimum. Smelting fuel in the best quality of coke is close at hand.

ACCORDING to a method devised by Prof. Pictet, of Switzerland, ordinary air is drawn slowly through a condenser which is cooled by a jacket kept filled with liquid air. In the condenser the low temperature causes the oxygen to separate by gravity from the nitrogen. The former is drawn off at the bottom of the condenser and the nitrogen at the top. Any carbonic acid present will become liquefied by the cold and will accumulate at the bottom, whence it may be tapped off through pipes. The inventor claims to be able in this way to make 500,000 cubic feet of oxygen daily by the expenditure of 500 H. P.

## Electrolytic Precipitation From Potassium Cyanide Solutions.

Written for the MINING AND SCIENTIFIC PRESS by J. H. JORY.

There has come into practice in South Africa and Australia an electrolytic method of extracting gold from solutions of this metal in potassium cyanide, which has been superseding the more expensive practice of the zinc precipitating process of the MacArthur-Forrest patents.

This electrolytic method, which is most generally known as the "Siemens-Halske process," has a number of advantages over that of the MacArthur-Forrest process. To point out these is not the object of the present article, but it is to call attention to a number of points in which the former is much less effective than it should be, and to the improvement of which an electrolytic method may arrive at.

The zinc precipitation method calls for considerable expense in the first costs of the metal used, and also in its after preparation to reduce it to the fill-form condition necessary for use in the zinc boxes. The gold is recovered in a very impure condition, making necessary considerable expense in its reduction and refining. The potassium cyanide destroys large quantities of the zinc and is itself destroyed. So pronounced are these useless and wasteful reactions that a large amount of both zinc and potassium cyanide are used in excess of that theoretically necessary for the desired extraction and precipitation. The process is also slow.

In the electrolytic process of precipitation as now operated in South Africa the electric current takes the place of zinc as a precipitating agent, the cost of power to produce the electric current being no more, probably, than that of producing the fibrous condi-

seven grains per minute. There would, therefore, be required for this deposition, theoretically, seven amperes per minute at about three volts tension— $7 \times 3 = 21$  watts, or  $\frac{21}{746}$  H. P. The current, however, as employed by the Siemens-Halske process amounts to at least fifty times this required power. There is at the same time about sixteen times the surface of cathodes exposed, more than is necessary to the operation performed, this making the unnecessary dispersion of the gold to which I have referred.

There is also connected with this apparatus and process a loss of the element of time. It is a law of electrolysis that "electrolytic energy—all else being equal—is in proportion inversely to the square of the distance between the two electrodes." Therefore, if, instead of placing the electrodes, as in the Siemens-Halske apparatus, at a distance of  $1\frac{1}{2}$  inches apart, they are given a proximity of  $\frac{3}{4}$  inch, there is an increase of power of depositing 256 times; so that, while in the former case there may be required to extract all the gold from a given amount of solution, that this should flow between the charged electrodes a distance of 256 feet at 1 foot per second, in the latter case the same results may be obtained by a flow of the distance of 1 foot only and at the same rate. But as we have, to obtain this result, decreased our capacity sixteen times, so, to operate on an equal amount, we should require an apparatus of the same width as that given, but having sixteen apertures of a proximity of  $\frac{3}{4}$  inch between the electrodes and about 1 foot in depth. In such case we should have an apparatus of sixteen times less electrode surface and of the same capacity as that employed in the Siemens-Halske process. The employing of lead plates as cathodes, in the process named, appears to be entirely owing to a misapprehension of the conditions. It has been urged that by using iron plates as anodes and lead as the cathodes that a wasteful

itly. It is hoped that the buildings will be ready by the fall of 1902. The college is in a prosperous condition. The number of students in attendance shows a gain over that of any former year. With the increased facilities for instruction which will be provided by the new buildings and equipment, the college has every reason to expect still greater success in the next few years.

### The Wilmerding School.

Many of our readers manifest much interest in propositions for industrial education, and we doubt not that reference to it in concrete form in the Wilmerding School in San Francisco will be acceptable. The school is at least so far a part of the University of California as to be administered by the regents of the University. It is also affiliated with the Lick School, as both institutions are under the directorship of Mr. George A. Merrill, and have shaped their courses of study so that one supplements the other. The administration of the Wilmerding School by a special committee, consisting of Regents J. F. Houghton, W. T. Wallace, S. C. Irving and President Wheeler, has been exceptionally wise and fortunate. By a circular which has just been issued, we learn that the regents received \$400,000 from the estate of J. C. Wilmerding and that they have, from the accumulations of interest, bought the block of land, built the building, equipped it for the modern trades and have on hand in mortgages and cash \$40,901.76 more than the original bequest. The annual income from investments is about \$27,000; the annual expense, including salaries and incidentals, is about \$20,400. Thus it is seen that expenditures are being kept well within the income, leaving ample funds for contemplated and necessary expansion. Nearly all the modern trades, in addition to a continua-

SIDE ELEVATION.

FRONT ELEVATION.

Building Which the Pupils of the Wilmerding School Will Erect for Their Own Use.

tion of the zinc necessary in the former method. The conditions of operating render it possible to extract a larger portion of the gold from the solutions, and there is a certain saving in the time and labor, in that lesser stoppages of the flow are necessary, a frequent change of the zinc from one cell to the other, combined with a tedious removal of the gold slimes, being necessary in the one case, while in the other a less frequent and more rapid changing of the lead cathodes for the recovery of the precipitated gold is required. The electric current may also be so adjusted that much less of the valuable cyanogen of the solution is destroyed in the latter than in the former process.

But, notwithstanding the several advantages enumerated, the electrolytic methods of the Siemens-Halske process seem still imperfect, and this because it follows in a great measure after the zinc precipitation method, there being the same condition of flow, nearly the same time consumed in the precipitation, and somewhat of the same difficulty and expense attending the reduction and refining of the product pertaining to the two methods.

I consider that these imperfections are not necessary to an electrolytic process, and are only incidental to an imperfectly constructed apparatus, on which the following description explains the improvements.

The Siemens-Halske process, briefly considered, consists of passing a flow of fluid about 3 feet in width and about  $1\frac{1}{2}$  inches in thickness between two electrodes a certain number of times—each time increasing the difficulty of extraction—until the greater portion of the gold existing in the solution is precipitated. The cathodes of this apparatus consist of a number of lead plates, which, under the conditions employed, must be fused and cupelled to obtain the deposited gold. The apparatus offers a very unnecessarily large electrode surface, which is wasteful of current and gives an inconvenient dispersion of the gold deposit.

According to the laws of the electro-chemical equivalents there is required, roughly, about one ampere of current to deposit one grain of gold in one minute. The apparatus of the Siemens-Halske process has a capacity of operating on about 100 grains of gold. Taking the latter quantity, and assume 10,000 grains to be extracted in one day, or about

return current is obviated at such times as the ordinary current may be stopped. But the fact is that while this may be true at the moment of commencing the operation, immediately after, as soon as the cathode surface has become covered with even the slightest film of gold, this, in potassium cyanide, becomes the more electro-positive, whether the cathode is composed of lead or any other metal; and the only proper course is to stop the flow of solution the moment the flow of electric current ceases.

Copper, therefore, may be used as a cathode of such an electrolytic process as I have described, with the advantage of being made a permanent part of the apparatus, from which, by a simple treatment before using, the gold may be removed in a perfectly pure state and with no after reduction and refinement necessary.

The conclusion that I desire to present is that though the Siemens-Halske process has many advantages over the methods of zinc precipitation which it is now superseding, yet even this can be improved by the construction and practice I have described.

It cannot be doubted that when such a perfected apparatus and process is produced a very great acceleration will be given, not only to the electrolytic extraction of gold from solutions of potassium cyanide, but to many other metallurgical operations of a similar character.

### Michigan College of Mines.

The Michigan College of Mines has received from the present Legislature of Michigan the largest appropriation in its history. It provides among other things for two buildings. One for the department of civil and mining engineering provides mining and hydraulic laboratories and a draughting room, together with lecture and class rooms. The other is for the departments of chemistry and metallurgy. Among the laboratories will be one for metallurgical operations.

The appropriation further provides an addition to the present engineering building, which will be devoted to the use of the course in blacksmithing. Provision is also made for extending the equipment of the electrical laboratory.

The work of planning for the erection of these buildings is already begun, and is being pushed rap-

tion of the grammar school requirements for entering, are taught by competent teachers, so that upon graduation the pupils go out with a good education in addition to full equipment for the special trade in which they have served their time.

One matter in connection with the school which seems to us of special significance as demonstrating the direct and practical character of the instruction is the announcement that the pupils will build a new building for their own use, of which the outline drawings on this page give a general idea. It will be a permanent, nearly fire-proof structure of brick and terra cotta, and work will be begun at the beginning of the next school year—July 24th. It will be built mainly by student labor, and will afford excellent instruction for several years. Its principal dimensions will be 160x70 feet. The two elevations shown are final only as regards the general mass and proportions of the building. If built by contract the cost would be about \$60,000. The cost of materials alone will be about \$40,000.

As to the arrangements for pupils, it is stated that any boy who has completed the grammar school is eligible for admission. Boys who have finished only the seventh grade will also be admitted, provided they are over sixteen years of age. Upon entering the school each boy begins an apprenticeship in one of the following trades: Carpentry, bricklaying, plumbing, blacksmithing, cabinet making, wood carving or clay modeling. The first year is probationary; at the end of that time any student who has failed to give promise of a successful career in the trade he has chosen will be required to change to another department.

Tuition is free and expenses for incidental things exceedingly small. The successful completion of a full apprenticeship of four years entitles the student to graduation as a journeyman. Any apprentice who leaves the school in good standing after two years' attendance will be granted a certificate showing the degree of proficiency he has attained in his vocation. The school will not guarantee positions to its graduates, nor will it promise equal ratings to all as journeymen. The first class will not be graduated until December, 1903, and it is hoped they will establish among employers a reputation that will ensure ready and remunerative employment for future graduates.

## The New Edison Storage Battery.

NUMBER II.—CONCLUDED.

In the new Edison cell, on the other hand, the theoretical action of the potash solution is merely to provide the proper channel through which the oxygen ions may travel in one direction or the other—positive plate to negative plate in charge, and negative plate to positive plate in discharge. Consequently, the amount of solution needs only to be sufficient to fulfill mechanical requirements. It is believed that the weight of solution will in practice be only about 20% of the plate weight or about 14% of the cell weight. In fact the cell may be worked in the same manner as the so-called primary "dry cells." Moreover, if the solution should escape, or be carried away, by gasing in charging, the only detriment seems to be the loss of active surface thereby occasioned, and it will only be necessary to fill up the cells to the proper level with water from time to time as evaporation or gasing may lower the level. For the same reason the specific gravity of the electrolyte does not appreciably vary during charge and discharge.

The briquettes of active material slightly expand on receiving oxygen, and slightly contract on delivering it, that is to say, the iron briquettes contract and the nickel briquettes expand during charge, while on discharge the iron briquettes expand and the nickel briquettes contract. The level of the solution is in this way scarcely affected. The expansions and contractions of the briquettes appear to be well within the elastic limits of the spring-steel containing boxes, and consequently the electric current is always secure. The covers or sides of the window pockets merely approach to or recede from each other slightly during charge and discharge. Fortunately, steel is a metal which possesses this mechanical elasticity in a marked degree.

The action of the charging and discharging current upon the briquettes seems to be transferred from their external surfaces inwards in a manner similar to the transfer of carbon and oxygen in the process of making malleable cast iron in the furnace on the principle of cementation. No active material has been found to be ejected from the briquettes through the window perforations, even under deliberate overcharging and discharging. Such gas as is thereby produced makes its appearance on the external surface of the windows.

If the nickel compound had no affinity for oxygen, so that energy was neither developed nor absorbed in the deoxidation or further oxidation of that substance, then the energy would be entirely that due to the energy of combination of oxygen and iron, stated to be 79.7 watt hours, and representing an electro-motive force, theoretically obtainable, of 1.47 volts. If the combination of oxygen with the nickel compound be exothermic or energy-releasing, then the watt hours delivered (and the electro-motive force) will be lessened by the energy necessarily paid back to break up the combination.

If, on the other hand, the combination is endothermic or energy absorbing, then the watt hours delivered (and the electro-motive force) will be increased by the energy restored on breaking up the combination. Since the superoxide seems not to have been known hitherto, no information concerning its energy of combination is obtainable. The electro-motive force of the cell seems to be so near to that of the union of iron and oxygen as to suggest that the nickel superoxide is not far from being neutral, or that the nickel compound has but little affinity for oxygen, although the superoxide appears to be quite stable in the cell.

The new cell does not seem to be appreciably influenced by changes of temperature, and should stand a very low temperature without detriment. The electrolyte—potash—does not attack any of the ingredients of the cell, nor are any of the ingredients soluble therein. No local action occurs in the cell so far as has yet been observed since the electro-motive force is below that necessary to decompose water.

The cell may be fully discharged to the practical zero point of electro-motive force without detriment. In fact, a cell has not only been completely discharged, but recharged in the reverse or wrong direction, and after bringing it back to its originally charged state by proper restoration of the direction of charging current, the storage capacity remained unaffected. It would seem, therefore, that the cell should be capable of withstanding much abuse.

Diagrams are appended giving the curves of discharge of experimental cells.

Mr. Edison states that "the negative plate (nickel), either charged or discharged, can be removed from a working cell and dried in the air for a week without appreciably injuring it, and when the plate is finally replaced in the cell its charge is practically undiminished."

The positive (iron) plate, if similarly removed from the cell will be likewise uninjured, but it soon loses its charge by the oxidation of the spongy iron with accompanying liberation of heat and appreciable rise of temperature extending over a period of several hours. On replacing the electrode, however, in the cell the storage capacity is unaffected on recharge. As regards cost, Mr. Edison believes that after

Curves of Discharge of Edison Cell at Constant Current, 3-4 Hours Duration.

Curves of Discharge of Small Multiple Edison Cell Weighing Twenty-Five Pounds.

factory facilities now in course of preparation have been completed, he will be able to furnish the cells at a price per kilowatt hour not greater than the prevailing price of lead cells.

Having now considered the action and properties of the cell, a brief description may be given of the difficulties encountered in developing it.

The phenomenon of passivity has probably kept inventors from finding this cell in the past. Mr. Edison believes that of all the very numerous compounds of iron, and of which he has tried many hundreds, the particular compound which he prepares is perhaps the only one capable of being used.

If the dried hydrates or oxides of iron, native or artificial, are subjected to electrolytic reducing action in any alkaline solution, they remain inert and unaffected.

On the other hand, if finely divided iron obtained by reducing a compound of iron under the action of a reducing agent such as hydrogen or carbonic monoxide is subjected to electrolytic oxidation in an alkaline solution it is inert and cannot be oxidized. It assumes the well-known passive state.

The same difficulty of passivity affects the use of nickel or the negative element. Finely divided nickel, reduced from a nickel compound, remains inactive when subjected to electrolytic oxygen in an alkaline solution. The monoxide and the black oxide or peroxide are also inert. No oxide of nickel is active or can be made active by electrolytic action, and the peroxide does not act as a depolarizer.

### Jeffrey Endless Picking Table.

The accompanying illustration shows one of the steel picking tables furnished the Mexican Coal &

Coke Co., Las Esperanzas, Mexico, by the Jeffrey Mfg. Co., Columbus, Ohio.

These tables are about 4 feet wide by 50 feet long and are constructed of two strands of Jeffrey roller chain, covered completely with double-beaded plates which overlap each other so that there is no opening in the apron or table when traveling either on a straight line or around the sprockets at the end. The plates are securely riveted to the chain attachments, while the chain travels on a suitable track or runway.

In this construction there are no intermediate rollers or idlers required for supporting the table, either for the loaded or return side. To prevent the coal from rolling off at the sides of the table, and to dispense with

the usual independent guards, additional overlapping end pieces are riveted to the ends of the plates, projecting about 6 inches above the table. This forms an open endless traveling trough about 4 feet wide and 6 inches deep, which is entirely self-contained. The plates are made of heavy steel and owing to the additional strength due to the double corrugations form a very stiff and at the same time comparatively light apron. These traveling tables can be supported in an iron or wood frame, while a floor can be arranged at either side for the pickers.

This same type of apron is also used for handling ore and other substances and can be made in different lengths, widths and weights for a variety of purposes.

### The Reno District, Nevada.\*

The Reno district, or, as it is more commonly termed, the Reno Star district, is the newest but undoubtedly the most valuable mining district in Washoe county at the present time. Included in this district are all the mines lying to the east of Reno for a distance of about 12 miles. Far and away the most prominent and most valuable of these locations are those owned and operated by the Reno Star Co., consisting of George Wedekind and sons. The Reno Star mine, which is about 6 miles east of Reno, was first located about five years ago, and although some little assessment work was done on it, the new vein was not discovered until about the first of April, 1900. The country rock in this locality is andesite, and the outcrop, which is much stained with iron (from which it derives its name—iron porphyry) may be traced for a distance of some 8 miles northeast, keeping the same general appearance and formation

as in the vicinity of the Reno Star mine. Part of the country rock near the mine is an agglomerate. The lode as thus followed is porphyry and lies under a heavy iron-porphry blanket which dips to the west.

The ore is cerargyrite, a silver chloride commonly termed horn silver, together with free gold. Up to the present time the ore has been followed for a distance of about 90 feet on the vein; thence another tunnel has been run off to the right for about 30 feet. The deepest point of the mine is not more than 40 feet from the surface. As the ore is very soft, picks alone have been used in digging it out, very little, if any, blasting be-

\* Ralph S. Stubbs in Nevada State Journal.

ing necessary. In opening this mine, ore was discovered within 6 inches of the surface. As work on the incline continues, the ore seems to remain the same average quality and runs from \$60 to \$1000 per ton.

The first shipment of ore from the Reno Star mine was made in April, 1900, and went to Salt Lake. The second and third shipments went to the Reno Reduction Works, and all other shipments have been made to the Selby Smelting Works of San Francisco. The ore, owing to its composition, may be smelted direct.

Crossing the Reno Star claim, and lying to the west of it, is the property of C. B. Bell. The claim exists on an agricultural patent and a lawsuit is at the present time pending between the owners of the Reno Star claim and Mr. Bell.

On this claim a shaft has been sunk to a depth of 115 feet, and on April 3 last ore was first struck. The ore is the same in appearance as in the Reno Star mine. Between April 3d and April 10th fifty tons of ore were taken out of the Bell claim, its valuation being estimated at about \$10,000. Mr. Bell is pushing his work very rapidly and expects in the near future to erect a mill on the ground, which will greatly facilitate the handling of the ore.

Since ore was first struck in the Reno Star district all of the land in that vicinity has been claimed and located, and much active work is now being done. Among these claims is the U. M. Slater mine, owned by U. M. Slater, Senator Flannigan and James Sullivan. Assays on ore from this claim have given very fair results and the owners are making preparations for extensive work.

## Mining and Metallurgical Patents.

Patents Issued June 11, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

SEPARATOR FOR HYDRAULIC AIR COMPRESSORS.—No. 676,016; W. O. Webber, Boston, Mass.

A downflow pipe having an enlarged lower end surrounded by one or more vertically disposed separating plates, the spaces between plates being of proportionately decreasing areas, each less than that of downflow pipe, upper edge of each succeeding separating plate projecting above lower edge of next smaller plate which it surrounds, and lower end of downflow pipe and its surrounding plates projecting vertically downward into an inverted vessel having its lower end open.

HYDRAULIC AIR COMPRESSOR.—No. 676,266; L. E. Mitchell, Boston, Mass.

A hydraulic-power cylinder, a piston reciprocating in cylinder, valve chests opening into cylinder at ends thereof and having waste outlets, a supply connection between valve chests and having slotted ends extending into chests opposite waste outlets, a reciprocating plunger valve having a plurality of plungers for slotted ends of connection, to alternately open and close them to the chests, valves for alternately opening and closing waste outlets, means for actuating piston valve from piston rod of piston, compris-

ing a shaft having a lug thereon, a double arm secured on shaft and engaged by a crosshead on piston rod, to impart a rocking motion to shaft, a crank arm loose on shaft and having spaced shoulders adapted to be alternately engaged by lug, a link connecting crank arm with valve stem of piston valve, and a weighted arm on shaft.

CONCENTRATOR.—No. 676,388; J. Mellein, Denver, Colo.

The combination with a suitable frame, of a horizontally, revoluble pan whose bottom is provided with a drum having a sprocket wheel, and terminating at bottom in a journal engaging bearing of frame, the pan being provided with a conical center, a hopper mounted above pan, a top frame mounted on main frame, a series of radially disposed bars located between pan and hopper, their outer extremities being attached to frame, a ring attached to inner extremities, depending agitator arms attached to bars and projecting into pan, an operating chain connected with sprocket on drum of pan, means for actuating chain, pump operated by chain-operating means, conduit leading from pump to discharge water into pan, and shovel or plow attached to one end of depending agitator arms, and projecting into pan near its outer edge to throw out gangue as pan rotates.

MEANS AND MECHANISM FOR UNLOADING ORE, COAL, ETC., FROM VESSELS TO DOCKS, CARS, ETC.—No. 676,075; A. McDougall, Duluth, Minn.

The combination of an elevator leg pivoted over a vessel, an endless bucket elevator within leg, means contained within leg for operating elevator, means for supporting leg in a vertical position, means for raising and lowering leg, a conveyor pivoted to leg, and connecting outtake of leg to a fixed discharge, flexible means for supporting conveyor in a normally horizontal position, and means for swinging intake of leg over cargo, such means operating simultaneously with elevator operating means.

COMBINED AIR COMPRESSOR AND EXPLOSIVE MOTOR. No. 676,349; F. H. Blasse, Paris, France.

A combined air compressor and explosive motor comprising two single-acting explosive cylinders a and c having inlet and exhaust ports with valves controlling same; a double-acting compressor cylinder b, placed between motive cylinders; one piston rod g on which pistons d and f of motive cylinders and piston e of compressor cylinder are mounted; the rod p connected to piston rod; rock shaft p' actuated by rod p; crank disks r mounted on shaft; two pairs of pitmen s, s', pivoted each to one of disks, and mechanism actuated by pitmen for controlling valves.

DUMPING CAR.—No. 676,278; A. Roesgen, Leadville, Colo.

A truck comprising a pair of side pieces each of which is provided with a series of axle-receiving bearings and also having one of its ends projecting upwardly, outwardly extending wheel guards carried by side pieces and arranged adjacent to bearings, inwardly projecting hoods also carried by side pieces and also arranged adjacent to bearings, axles mounted in latter, inwardly extending lips carried by side pieces and disposed above hoods, a covering plate mounted upon side pieces, bolts passing through plate, lips, hoods and axles, a saddle piece connecting upwardly projecting ends of side pieces, and an inclined web connecting other ends of side pieces, a body mounted on covering plate and normally resting upon saddle piece, a hook carried by body and adapted to engage truck for locking body in engagement therewith, and a lever for operating hook.

CONDENSER FOR FUMES OF METALLURGICAL FURNACES.—No. 676,380; E. Balbach Jr., Newark, N. J.

A tower-shaped structure, provided with longitudinal and transverse partition walls, an inlet flue at one side, an outlet flue at opposite side of tower, openings arranged alternately at upper end and lower ends of longitudinal partitions, air spaces arranged in opposite walls of tower, pipes passing through longitudinal partitions and connecting air spaces, air inlet openings into air space in one end wall and an air outlet at upper end of air space of opposite wall.

BALL GRINDING MILL.—No. 676,254; C. Hofmann, Breslau, Germany.

The combination of a trough-shaped ring, a rotary drive shaft within it, supporting arms extending radially from shaft, depending links pivoted to arms, grinding balls suitably supported by links, and means positively connecting links with drive shaft for imparting an oscillatory movement to links and balls.

In a British patent issued to Herr Kugel of Berlin is described a method of depositing nickel electrolytically in layers of such thickness that the product is equivalent to rolled nickel in its mechanical properties of toughness, durability and ductility. The method is to acidify the nickel solution with a mineral acid which is unalterable by the electric current. Such an addition usually spoils the bath, causing the deposit to flake off, but this difficulty is overcome by keeping the electrolyte at a temperature over 30° C. Under these circumstances a homogeneous non-crystalline metal is said to be deposited and may be put down in sheets of any required thickness.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

### JUNEAU.

Consulting Engineer Allen, who has been making an examination of the Sheep Creek water power for San Francisco capitalists, who will take up the \$75,000 bonds to construct the power plant, has returned to San Francisco to report. The Sheep Creek Power Co. is a local company, headed by F. Hammond, who have a ten-year contract to furnish power and light for the Ready Bullion mine at Treadwell. It is also the object of the company to furnish wholesale electric power in Juneau. It is expected that construction of the plant will be started as soon as the engineer's report is approved in San Francisco.

### RAMPART.

Big Minook, heretofore called winter diggings, will be worked by hydraulics and ground sluicing this summer. The continuous pay found from 17 below to 80 above has decided the mine owners to work the benches by water from upper Minook and tributaries.

Slate creek from 3 above to 7 below will be handled by flumes. As a prospect the ground is very shallow, in only a few instances being more than 3 feet deep and nuggets weighing \$40 are occasionally picked up on the rims.

### PORCUPINE.

Dalton & Co. have put in a flume, carrying the whole of Porcupine creek. It is 750 feet long, 20 feet wide and 5 feet deep, and the company will mine the bed of the creek. H. Larsen is Supt.

Clark & Biglow, on No. 1 above, have a flume 350 feet long, 18 feet wide and 4 feet high. J. Biglow is Supt.

On No. 1 below hydraulicking has commenced on the high bars. A. Smith is Supt.

The Calhoun Co. on McKinley creek are working on the pay streak and expect a large cleanup.

Hall & Chisholm on McKinley have put men to work on their property.

Voget, Myers & Martin have put in a solid stone ditch at considerable cost and are now ready to develop their claim.

There has been over \$60,000 worth of machinery placed in position on Porcupine and McKinley creeks this season.

## ARIZONA.

In 1899 J. S. and R. Cary, E. and F. Smith, A. Wilfley and other Denver men bought the Pride of the West mine, in Washington Camp. The ore carries copper, zinc blende, garnet and considerable quartz, besides from 2% to 4% of lead. In the treatment scheme developed by Mr. Wilfley the ore is first roasted sufficiently to coat the particles with oxide of iron. After cooling, they are passed under the poles of an electric magnet, taking out the greater part of the copper, leaving the tailings carrying zinc blende, garnet, quartz and galena. The tailings were then passed over Wilfley tables, which take out the galena with nearly two ounces of silver to each unit of lead, making a product of lead-silver ore containing 50% to 60% lead and 100 to 120 ounces silver to the ton. The tailings are then subjected a second time to the magnets, which takes out the remaining copper, garnet and zinc blende, which are set aside for further treatment, and the residue again passed over Wilfleys, the remaining galena being taken out. The result is a very clean extraction.

### COCHISE COUNTY.

The combination shaft at Tombstone is now timbered and sunk to a depth of 60 feet. The sinking is at the rate of 5 feet per day. Thirty men are at present employed on the work.

### SANTA CRUZ COUNTY.

H. A. Smith, manager of the Ella No. 2 copper mine, in Washington district, owned by the Standish M. Co. of New York, is arranging to commence extensive development work on the mine.

Near Patagonia, Hartwick & Schwarty are developing a copper property. They have a 6-foot ledge—2 feet upon the hanging wall of copper glance, which will yield 35% to 40% of metal, the remaining 4 feet high-grade sulphides.

## CALIFORNIA.

### AMADOR COUNTY.

The Bunker Hill shaft is now down over 900 feet.

The Keystone mill at Amador City is to be ready for crushing by October.

Alvinza Hayward has bought the Pacific, Indiana and Phoenix mines at Plymouth, under judgment obtained against corporations who were the owners.

W. W. Worthing of Stockton, the pro-

spective purchaser of the Rhetta mine at Plymouth, and C. Kretcher, the owner of the mine, have arranged the terms of the final payment for the mine.

### BUTTE COUNTY.

It is reported that the Little Hope mine, near Mountain House, has begun operations again, and that the Kellogg mine in the same neighborhood will soon be reopened.

### CALAVERAS COUNTY.

The McSorley Bros. have struck excellent ore in the Emma mine at Campo Seco. The shaft is down 130 feet and the ore was struck crosscutting the ledge. The ore shows bunches of good sulphurets and visible gold and is almost in appearance the same as ore from the Gwin mine.

### EL DORADO COUNTY.

Mrs. Atwood of Boston has recently bought a large interest in the Iraime mine and will personally conduct the operations.

A contract has been let to sink a shaft on the Shaw mine, at El Dorado, now 100 feet deep, to a further depth of 500 feet.

### NEVADA COUNTY.

Dr. Sherwood and Mr. Kamp of San Francisco have recently examined the P. Boyle drift claim at Excelsior Hill, with a view of opening it up.

### PLACER COUNTY.

A. Bordeaux, vice-president and general manager of the Ralston Divide G. M. Co., has gone to Paris, France, to make a report to the company. He expects to return some time in September and resume operations at the mine.

### PLUMAS COUNTY.

J. Montiech, of Dubuque, Iowa, is at Quincy to erect hoisting works and a pumping plant on ground north of the Bell Quartz mine, to prospect by a shaft a gravel channel running through the Newtown slope of the hill.

The Glazier placer claim on the north fork of Feather river has been bought by San Francisco people, represented by Rev. J. H. Webber, for \$10,000.

W. K. Aldersley of Bangor, Butte county, has men at work on the Harris quartz ledge, near Poorman's creek.

### SHASTA COUNTY.

J. & W. Blagrove, who have leased the old Washington mine at French Gulch, have uncovered an ore body from 7 to 12 feet wide going from \$25 to \$35 a ton. The ore will be hauled to Keswick for reduction.

### SIERRA COUNTY.

G. Chase of Chicago is at Downieville inspecting his mining properties, one of which is known as the Central California. There is a fine ledge in this mine and there are good facilities for working the ore. It is the intention of the company to begin active work on this mine soon. The other property owned by the company is a drift claim. Quartz taken out recently has paid well.

The hydraulic mine at La Porte, operated by a Boston company, has resumed work after three weeks shutdown by reason of an injunction by the Anti-Debris people. They are now working under a stipulation.

The Chinese company renting the John Doherty claim at Howland Flat are working a large number of men, and are reported to be on good pay.

It is reported that negotiations that have been pending between the Pacific G. M. Co. and outside capitalists have resulted in the sale of the company's gravel mine near St. Louis. The sale was made through J. Thomas of La Porte, the price paid being about \$30,000.

The Thistle Shaft Co. are working on Slate creek, near the mouth of Wallace creek, grading for buildings and wagon roads and running their main tunnel, which is now in about 100 feet. It is a 10x8 tunnel with double track. Three Burleigh drills and an air compressor are being installed. It will require over 6000 feet advance to reach the channel, and over a year's time.

### SISKIYOU COUNTY.

The Wild Irishman ledge on Mathews creek, near Cecilville, owned by Bowerman, has been bonded to a San Francisco company, who have several men, under Supt. G. Gerkin running a new level to see if the ore in sight goes down.

### TRINITY COUNTY.

The Sweepstake hydraulic placer near Weaverville has been sold to E. V. Douglass, W. P. Douglass and T. S. Lewis of Philadelphia. R. J. Anderson, M. E., of Idaho, represented the buyers. The price is variously reported from \$3,000,000 to \$6,000,000. The purchasers have taken possession and have let contracts for the construction of pipe and ditch lines aggregating about \$500,000. Frank H. Hall, one of the sellers, is in general charge of the new construction. The claim adjoins the La Grange, sold some years since to a French company for a large sum, but is

much richer, the average gold content of the gravel being said to be more dollars a cubic yard in the Sweepstake than cents in the La Grange. The Sweepstake channel is a remnant of the first or oldest channel, and is probably of Cretaceous age. Other small remnants of a river system of an age to which this probably belongs have been mined on summits and benches of the higher Klamath mountains. It is a notable fact that the appearance of the gold is similar to gold mined in the Klondike, and different from the gold of Weaver basin, which originally was part of the deposit in the Sweepstake channel before its erosion.

The Lappin mine, adjoining the Brown Bear at Deadwood, is shipping rich ore to the Keswick smelter.

W. S. G. Todd of Weaverville has sold to F. Pichon a half interest in a quartz mine on the North Fork of Trinity river.

A very rich strike is reported to have been made in the Black Diamond quartz mine on Canyon creek, owned by Dr. W. H. LaBaree and J. A. Morris of Weaverville. The owners working on the property have run in a tunnel over 104 feet. Where the ledge is cross-cut it is over 3 feet wide, carrying free gold and tellurium. On the location are three parallel ledges, carrying the same tellurium indications. The rich strike spoken of was made on the upper ledge and the rock is encrusted with gold.

T. F. Loughborough of San Francisco has bonded 5000 acres of supposed gold-bearing ground, which can be exploited by dredger, in Hay Fork, and expects to begin prospecting with a Keystone driller within thirty days.

The Fortuna Copper Co. has been incorporated in Humboldt county to work mines chiefly in Trinity county, with its principal place of business at Fortuna, Humboldt county. The incorporators are C. Swett, I. H. Hunter, T. L. Legg, D. Mudgett, A. Rolley, P. J. Mulley, M. J. Swartzel.

The Brown Bear Co. are still sinking and raising for the shaft on their ledge at Deadwood.

Reeves, Davidson & Co. are taking out rich rock from the old Shafter mine and have run 100 tons through the Brown Bear mill.

### YUBA COUNTY.

Ten tons of rock from the Cabbage Patch mine near Wheatland have been hauled to a Grass Valley mill for a test mill run. The ore shows well in free gold and sulphurets. A quantity of the rock has also been shipped to the smelter. Tests already made have paid from \$20 to \$50 per ton. The mine is owned by R. Vincent and others of Grass Valley, but is bonded to W. Foote, E. Roberts, R. Quick, W. Eddy and W. Billings.

### TUOLUMNE COUNTY.

The Olesen mine, near the Solambo, at La Grange, is being opened up. The dump is being worked over and shipped to Selby's. The ore formerly went 37% copper, 16 ounces silver and \$19 gold per ton.

C. Claytor of the Gray Eagle mine at American campsays the new shaft is down 75 feet. The hoist has been moved from the old shaft. There is a 2-stamp mill on the mine. M. Page is Supt.

Operations are being pushed on the Goldwin Co.'s property, managed by Capt. McClintock. The main shaft is down 500 feet and the ore shoot is growing richer. The rock shows free gold. The new mill is practically completed.

Supt. Restano, of the Golden West mine, situated on the Comstock ranch, reports the building of the mill to be going on rapidly. A new shoot of ore has been uncovered in the mine, showing 3½ feet of quartz in which gold is visible in every part. The old shoot has over 5 feet of good milling rock.

The bond on the Street mine, at Columbia, was closed last week and the property bought by R. Kinsman, who will make extensive improvements on it. Sinking in the shaft, now down 300 feet, has been stopped and a drift is being run on that level. Oil is to be substituted for wood for fuel, a 3000-gallon tank having been ordered. An air compressor will be added to the plant and air drills put in the mine.

The Preston Hill M. Co. has incorporated to operate the Preston Hill quartz mine, at Jamestown. The directors are S. Silliman, Oakland; E. C. Dailey, T. K. Code, C. F. Humphrey, San Francisco; E. T. Hale, Jamestown. The last named is Supt.; capital stock, \$500,000. The formation in the tunnel at the mine, now in 148 feet, is changing into a heavy mineralized slate, showing some quartz of favorable appearance.

In the west end of the Crystalline mine, at Jamestown, a 3-foot vein of ore of good grade, carrying copper, silver and gold, has been struck. This character of ore is unusual on the mother lode. The Tuolumne Electric Power Co. is at present

stringing its wires to the mine and a transformer house is being built near the old works. Electricity will supersede steam at this mine.

The new 10-stamp mill on the Duleak mine, situated on the south bank of the main Tuolumne river, has been started up. On the vein is a shaft 150 feet deep, at the bottom of which drifts have been run north and south 200 feet, exposing a well-defined vein averaging 7 feet in width and carrying considerable free gold. The mine is owned by a San Jose stock company, of which W. Graham is Supt.

The Pearl M. Co., M. Tait Supt., is developing its mines near Confidence slowly but systematically. The crosscut tunnel has been driven in 130 feet, and is estimated to be within 30 feet of the Pearl vein, which will be cut about 125 feet below the surface.

A wagon road is being constructed from a point on the Buchanan road, near the Galo Ralph ranch, to the Lost Fox mine. Supt. M. Bulski is also having three-fourths of a mile of flume built to carry water for power development. The mine will then be equipped with both steam and water power. Immediately on the completion of these improvements, sinking will be resumed.

## COLORADO.

### BOULDER COUNTY.

Work is progressing very steadily in the Wall Street district, scarcely any of the producing mines are idle, and only these for improvement, putting in machinery or awaiting its arrival. The following are in full working order and producing ore now: The Melvina, Ingram, Richmond, Golden Eagle, Emancipation, Inter-Ocean, Monongahela, Yellow Pine, Logan, Caroline, Dime, Dirigo, Concord, Gillard, Gold Lode, Lucky Star, Slide, Tamborine, Zophar, Franklin, Wood Mountain No. 1, South American, Smoky Hill, Gladys A., L. C., Phoenix, Cross, Daisy, Ethel, Second Hold, Klondyke, Cold Spring, Elkhorn, Wall Street, Little Giant. Others are doing development.

It is stated that over \$50,000 will be expended in development on the Victoria mine, at Salina. The No. 2 shaft will be sunk to a depth of 800 feet.

The Revenge Co., at Eldora, have struck a high-grade ore body in the 280-foot level. It is gray copper and gave assay returns of 25% copper and 2600 ounces silver to the ton. The shaft is now 300 feet deep.

Several copper leads have been discovered in Sunshine canyon, near Boulder, by J. L. Bell, who has done some development work. I. E. Alcorn is a part owner and they have recently bonded the Avoca and Mancipation claims to a Denver party, who commenced work on the 10th inst.

The first shipment of 1901 of tungsten ore has been made to the Krupp Steel Works, Germany. The ore is from the Combination mine, in Grand Island district, under lease to D. W. O'Keefe. A sample of the shipment assayed 56.20% of tungstic acid and a trace of sulphur, which makes the material very desirable for use in steel works. The concentrates are worth \$150 per ton when the grade is as high in tungstic acid as this shipment. The ore is also found at Yankee hill, Gilpin county, and in the Silverton district, San Juan county.

### CLEAR CREEK COUNTY.

The Ora Verde M. Co., operating the Florence tunnel at Yankee, propose to erect ore bins at once. Manager Good-year reports that he has struck the Ross lode, for which he has been driving the tunnel, and is near the rich shoot of ore uncovered in the shaft, which is cut by the tunnel at a depth of 450 feet.

It is said that work will soon be resumed on the Owsley group, in East Argentine, by Schauer & Co., who have it under bond.

The Salisbury mine, located near the Stanley, Idaho Springs, is working under lease to King & Foster, who have twelve sub-lessees. From the 70-foot level very fine copper ore is being extracted. It is the intention to unwater the mine below this level.

C. A. King, who has charge of the J. Warner mine in Gilson gulch, Idaho Springs, is driving a crosscut from the bottom of the 70-foot winze to cut 100 feet deep a vein carrying good surface values.

### FREMONT COUNTY.

At a meeting of the stockholders of the Rocky Mountain Smelting Co., held at the office of the company in Denver, it was decided to increase the capital stock from \$750,000 to \$1,250,000 and to double the capacity of the plant.

The Brock M. & M. Co. has been incorporated at Florence. It owns 125 acres of mining property in one body, situated in the Sangre de Christo range, 6 miles east of Villa Grove, consisting of eleven claims, mill site and water right. W. H. Brock of the company, working in the Mountain

Lioness, on a prospect trench for about 125 feet in length and 8 feet deep, has figured up the first month's operating expenses to be \$380, with \$720 worth of ore on the dump to offset it.

## GILPIN COUNTY.

J. A. Emory and E. A. Moulton of Boston, Mass., for Boston parties, have bought ground at Golden for, it is said, \$10,000. The ground was bought for a concentrating mill site. Work on construction is to begin immediately. The new plant will be of 150 tons capacity, built in two sections of seventy-five tons capacity. The company intend to run it as a custom mill.

The Gold Brick lode, east of the Colorado-Carr mine, in Enterprise district, owned by Schultz of Black Hawk, has been bought by the Colorado-Carr Co. for \$7000. The company has made a survey for its aerial tramway from the Carr to the 50-stamp slow-drop mill on Clear creek, in the lower portion of Black Hawk. The added property when opened will insure ore to keep the full capacity of the mill employed.

## HINSDALE COUNTY.

The Hanna Co., operating the Moro and Ajax mines, have opened between 6 and 8 feet of ore in the Moro property.

## LAKE COUNTY.

O. C. Bartholomew, manager of the Sedalia mine of Leadville, says the production of the mine is keeping up to the standard and arrangements for sinking the shaft an additional 300 feet have been concluded, which will make it 1000 feet, where it will cut the sulphides known to exist in that section of the camp.

A. H. Webber of Denver has completed arrangements for work on an old property in Tennessee park, Leadville. He says that the group was worked in the 80's and produced between 5000 and 6000 tons of ore that averaged better than \$2 per ton in gold. The principal work was done on the Lucy L. claim, which was equipped with a mill, and by reconstructing the mill with modern appliances the mine can be made to pay.

Work on the Hummer property, Leadville, G. M. Mitchell, Supt., has started, and some lead ore has been opened in the upper level. The strike of sulphides in the Resurrection mine just north gives assurance of finding them in the Hummer. A new shaft is under consideration and work on it may be started.

## MINERAL COUNTY.

A rich body of ore has been opened in the shaft being sunk from the Nelson tunnel at Creede. At a depth of 80 feet from tunnel level the vein was opened and for 3 feet width assayed sixty ounces to the ton in silver. The strike is 1500 feet from the apex of the vein, the greatest depth ever attained in the district.

The Bachelor is making a steady output.

Shipments from Creede so far this year have been about 7000 tons per month and the total tonnage since the first of the year has been 36,903 tons.

The ground has been prepared for the erection of the Big Kanawha mill at Creede. The mill will probably be completed by October 1.

## OURAY COUNTY.

J. W. Benson, manager of the Camp Bird mine, at Ouray, has ordered twenty more stamps to the mill, making 100 stamps, with a daily capacity of 300 tons, equivalent to a monthly output of \$300,000.

The Camp Bird Extension Co.'s plans include a tunnel, starting near the Mount Lion tunnel near Ironton, and going under Spirit basin, through Hayden mountain to Imogene basin. This tunnel will cut a large part of the rich veins in the company's many claims. Ironton will be the base of operations.

A strike has been made in the Growler mine, Red Mountain district, owned by S. L. Fleitus, now operated under a bond by H. Smith of Ouray. A body of ore 2 feet wide has been opened, brittle silver predominating and the values running from 300 to 6000 ounces of silver to the ton.

## SAGUACHE COUNTY.

The Cripple Creek & Idaho M. Co., E. C. Whitney Supt., who bought five claims near Crestone, with water right and mill site, has men at work on a crosscut tunnel.

## SAN JUAN COUNTY.

Work has been started on the Champion No. 2 mine, on Sultan mountain, recently bought by J. C. Doucey, W. H. Beemer and W. H. Gamble of Detroit, Mich. The ores will be treated at the local smelter.

The Anti-Periodic's rich ore, recently encountered, is now reported to run \$800 per ton, and a talc streak in the vein averages 1500 ounces of silver.

The Elizabeth M. Co. of Pueblo, with O. H. P. Baxter at the head, has bought seven claims located between Poughkeeps-

sie gulch and the west fork of the Animas river, and is making arrangements for the prosecution of an extensive system of development.

New machinery is being installed on the Evening Star mine of the Sunlight Co. in Mastodon gulch, of which J. J. Yeckel of Denver is president.

## SAN MIGUEL COUNTY.

The Crown Point group at Ophir, recently bought by the Milwaukee-Ophir Co. for \$40,000, has recently opened a body of first-class ore. Eight men are taking out four carloads per week of smelting ore that carries 60% lead and gold and silver, making its value \$100 per ton.

## TELLER COUNTY.

The shaft of the Gold Coin mine is now down to a depth of 1125 feet and a station will be cut. The company is now hoisting good ore from the 850-foot and 1000-foot levels. The vein cut in the 850-foot level is looking well.

D. Heaton, of Victor, has a three-year lease on the Mary Alice claim, which contains about five acres and lies adjacent to the Independence and Portland, on Battle mountain. It has a 425-foot shaft and some laterals. The former operators reached two veins of good size that assayed below pay. Mr. Heaton proposes to sink another 100 feet and crosscut. He will install a 10x14 hoist.

Possibilities of productiveness in Stratton's Independence are now considered greater than they were at the time of the sale by Stratton to the Venture Co. In the old workings the ore bodies exposed have been increased during the past few months. The management is reported to be negotiating for the installation of heavier machinery for hoisting to augment the present plant. With the increase in power it is calculated that the production may be increased somewhere between a half and a third. During May the output was 6300 tons, the gross value of which was about \$250,000.

Work is to be started on Mollie Dwyer ground at Cripple Creek by the company through the Pointer workings. Work has been suspended for some time in order to start sinking from the 525-foot level of the Pointer.

Bunches of sylvanite are being found in the eleventh level of the Isabella, at Cripple Creek, and it is believed that the mine is coming into bonanza again. Ore has been opened in several places. In the fourteenth level a 3-foot vein, running from one ounce to twenty-eight ounces, has been found. G. D. Kilborn is the general manager of the mine.

## IDAHO.

## BOISE COUNTY.

The Twin Sisters mine, at Centerville, is being equipped with a 5-stamp mill. The holdings embrace two veins 500 feet apart. The work opened is through a 250-foot shaft, with 300 feet of work on the veins. E. F. Blain is superintendent.

Near Placerville a 5-stamp mill is operating on the Mineral Hill.

The Last Chance, near Quartzburg, is producing, the ore being milled. H. Barry is manager.

The dredgers at Idaho City are operating successfully under the management of Rupert Winters. The two dredgers handle about 4000 yards of material daily.

The North Star, 12 miles from Boise, in Shaw's mountain, is operating with a 10-stamp mill, with plates and concentrators.

The Viola, 15 miles northeast of Boise, is operating with a small force, and is in gold ore.

The Twin Springs placers are doing but little work at present.

The Iowa, at Quartzburg, is operating again. The Iowa, North Star, War Eagle and others are under the management of H. L. Woodburn.

Boise, Idaho, June 5.

## CLEARWATER COUNTY.

J. R. Greer of Oro Fino says that Clearwater county has seven stamp mills in operation and four more are now en route, one of these being twenty stamps. Besides this there are three hydraulic elevators in operation, each with a capacity of 1200 yards of ground per day. There are about 200 placer mines working in the new county, all using giants. Generally the ground is very good, much of it running from \$1 to \$1.50 per yard, this being true of all the small giant propositions, and often on the hydraulic elevators they find the same rich material.

## KOOTENAI COUNTY.

W. L. Wester of Colfax, Wash., reports active work in the St. Maries river placer district. R. Neill, owner of the discovery claim and the one above it, is making fine cleanups in mining on an extensive scale. There is a plan being considered to build a flume from the St. Maries river for water for hydraulicking. D. C. Corbin, who bought the claim below the discovery for \$4000, is opening it with a full

equipment and a force of men. There are from thirty to forty prospectors in the district and a number of good prospects have been discovered.

## SHOSHONE COUNTY.

The Bunker Hill & Sullivan M. & C. Co. has brought suit in the U. S. Court against the Last Chance M. Co., the Shoshone M. Co. and the Empire State-Idaho M. & D. Co. for \$74,000 damages. It is alleged that the defendant companies have tunneled into the Tyler lode, owned by the Bunker Hill & Sullivan Co., and appropriated ore to the value of \$74,000.

It is reported that at the recent conference between the Cour d'Alene silver-lead mine owners and the American Smelting & Refining Co. managers in New York recently no agreement was arrived at. The difference is said to be in the smelting company insisting that they alone should fix the price of the lead. The mine owners are said to be considering the possibility of constructing their own smelters and refinery if the smelting company does not modify its proposition.

P. Clark and his associates have brought suit against C. Sweeney, the Buffalo Hump M. Co. and the Empire State-Idaho M. Co. Clarke alleges that Sweeney unlawfully broke into two claims adjoining the Tiger-Poorman mine in Idaho, explored them with diamond drills, extracted ore and paid dividends, and then by intrigue, falsehood and misrepresentation induced the plaintiffs to sell for \$4000 property which was worth \$1,000,000, saying they wanted it only for the surface rights. Those associated with Clark are B. C. Kingsbury, J. Clark and J. P. Harvey, while F. R. Culbertson is joined with Sweeney as defendant.

## WASHINGTON COUNTY.

R. T. Wolston, superintendent of the Brown-Stemwinder group in Health district, near Weiser, says he is completing the buildings and making other improvements, and will increase the force in the mine. A road from the town, 1½ miles in length, is nearly completed.

## MONTANA.

## CASCADE COUNTY.

At the stockholders' meeting of the Diamond R. Co., held in Great Falls, it was decided to consolidate with the Broadwater group, near Neilhart, owned by L. S. McLure and O. D. McLure, and to form a new corporation capitalized at \$1,500,000. The two properties are valued at about \$1,000,000 each and will be consolidated on an equal basis. Final arrangements for the consolidation are being made. The Diamond R. Co. addition to its concentrator, increasing its capacity to 300 tons daily, is completed and in operation. The tramway for carrying ores from the Broadwater group to the concentrator, erected at a cost of \$30,000, is also in operation.

## FERGUS COUNTY.

On the 6th the Eagle group, in the Gilt Edge district, was bonded by H. T. Kendall & Co. for one year at \$20,000. The group consists of five claims, joining the Central Montana Mines Co. on the south and on the eastern slope of the Judith range. The claims are undeveloped, but show ore, a red vein filling in a fault in the limestone. Ores from the claims average \$8.20 per ton. Development work has been commenced, which, if satisfactory, will result in the building of a mill.

The bullion product of the Central Montana Mines Co. for May was 1043 ounces; valuation, \$18,227. Ore crushed, 3368 tons, showing average values extracted a little less than \$6 per ton. A receiver has been appointed to operate the property pending litigation. During May the Great Northern M. & D. Co., at Gilt Edge, crushed 4400 tons; bullion product about \$34,200.

Lewiston, June 12.

## FLATHEAD COUNTY.

The Cabinet Queen M. Co. has resumed work on its mine on Grouse mountain, 14 miles from Troy. The claims of the company are the Little Spokane, Cabinet Queen and Little Butte. About 300 feet of tunneling has been done on the Cabinet Queen. The ore is principally galena, but sulphide of copper and arsenical iron are found in it. The iron carries some gold. It is a concentrating proposition.

## LEWIS AND CLARKE COUNTY.

A strike of copper ore has been made on the Red Bird claim on Greenhorn gulch, 12 miles west of Helena, by Panches & Co. The mine was started as an iron mine to supply iron flux to the East Helena smelter. The ore, in addition to the high percentage of iron, carried gold values. Seven cars of ore had been shipped and a shaft sunk to a depth of 80 feet, when a 10-foot wide vein with a pay streak of 20 inches of high-grade copper ore was discovered.

C. W. Clark and others of Butte have

bonded for \$50,000 forty acres in Helena, adjoining the Kenwood mine, which they are now developing. This gives them under bond 160 acres, covering the same vein. The last bond is taken from H. M. Pachen, who less than a year ago gave a bond for \$600 on the same tract and engaged in litigation to break the deal when he found it was mineral land.

## MADISON COUNTY.

The Blackstone M. Co. has been incorporated by F. Trainer, A. Gray and E. J. Schwefel, capital \$10,000, to mine in this county.

## MEAGHER COUNTY.

A. Ely of Chicago, Ill., and P. Ely of Cleveland, Ohio, have been at Copperopolis, arranging to start development on their claims in that camp.

## SILVER BOW COUNTY.

The official tabulation of the earnings of the Butte district mines, compiled from the annual reports of net proceeds, shows earnings as follows:

| Name.                                             | 1901.          | 1900.          |
|---------------------------------------------------|----------------|----------------|
| Anaconda.....                                     | \$5,069,071 61 | \$6,228,655 25 |
| Boston & Montana.....                             | 7,042,303 68   | 6,073,153 34   |
| Butte & Boston.....                               | 586,053 72     | 325,044 00     |
| Montana Ore Purchasing Co. (Heinze), 1,250,000 00 |                | 400,000 00     |
| Colusa-Parrott (Clark).....                       | 245,400 00     | 325,044 00     |
| Lexington.....                                    | 6,503 00       | 677 21         |
| Snohomish & Tramway....                           | 53,301 00      | 79,800 00      |

No reports have been received from the Parrott, Speculator, Washoe and Colorado companies. The Montana Ore Purchasing Co. and Boston & Montana companies have reported their earnings only and do not go into details as to the cost of operations, while the other companies make affidavit to every cent of money received through sales of metals and all expenditures.

During the year the Anaconda Co. mined 1,276,896 tons of ore at a cost of \$5,069,071. It cost \$191,534 to transport to Anaconda, \$5,288,720 to reduce it, and \$2,007,415 to market. During the year the company expended \$4,785,399 for new machinery. Its gross proceeds were \$18,128,558.51. The Butte & Boston mined 214,310 tons of ore. Its cost of mining was \$969,047; transportation, \$41,019.10; reduction, \$551,344. The company expended \$631,531 for machinery and \$436,147 for supplies. From the Lexington group of mines 2815 tons of ore were extracted; \$21,857 was paid for labor and \$4340 for supplies. The Alice G. & S. M. Co. is the only mine operated at a loss. It mined 5004 tons of ore, from which it received \$71,706. Its expenses were \$75,229.67. The property is owned by the Walker Bros. of Salt Lake and its product is largely silver. The Colusa-Parrott Co. extracted 236,635 tons of ore at an expenditure of \$854,233. Other items of expense were: Transportation, \$65,033; reduction, \$792,609; supplies, \$305,005.

The discovery of immense copper veins in the hills just east of Butte is reported. Extensions of veins from the Anaconda and Boston & Montana properties are believed to have been found. Hundreds of claims have been made. In one, which is called the Hornet, a rich vein was found within 8 to 20 feet of the surface. F. Farrell of Ansonia, Conn., is said to have bought several hundred acres, paying for them \$1,500,000. The Anaconda, Boston & Montana, Butte & Boston, Heinze and Clark companies are scrambling for ground.

Operations on the Smokehouse mine, in Butte, have ceased, because the owners of the property have refused to grant the exploration company an extension of the option. Nearly \$150,000 has been spent, but without success, in finding the large lead north of the shaft, exposed while workmen were excavating for a building. The Nipper M. Co. has mortgaged for \$2,500,000 all its property, including an interest in the Nipper, L. E. R. and Nightingale copper mines.

The shaft on the Gem mine is down over 700 feet. The property is being worked by J. A. Murray and H. L. Frank, who have spent about \$75,000 in its development.

The District Court's decision in the suit brought by M. Finlen against F. A. Heinze and the Johnstown M. Co. to recover possession of the Minnie Healey mine, valued at \$10,000,000, was in favor of Heinze and the company. The decision makes it necessary for the defendants to pay Finlen \$54,000 to recompense him for the money expended in the development of the property prior to its sale to Heinze. The decree gives Heinze undisputed ownership of five-eighths of the stock and the Johnstown Co. one-eighth. It is said operations will be resumed at once.

The Alice mine at Butte has a large body of ore, but it has so far proved a failure, because the mixture of minerals

is such that metallurgists have not successfully treated them. T. W. Buzzo is general manager of the company. A large quantity of the ore of the Alice carried six distinct minerals—gold, silver, copper, lead, zinc and iron—and their separate values per ton of ore is about \$7 in gold, an average of twelve ounces in silver, \$15 in copper, from \$16 to \$18 in zinc and from \$3 to \$4 in lead. The Alice company wants a process for saving at least 75% of all these minerals.

## NEVADA.

## DOUGLAS COUNTY.

The placer mines in Pine Nut district are being worked by a few men, and it is thought that there will be enough water to continue operations until August, when the clean-up will be made.

## ELKO COUNTY.

The King Solomon M. & M. Co. has been incorporated in Salt Lake City, Utah, capital \$2,000,000. E. M. Conroy of Ogden president, J. D. Murphy of Ogden secretary, A. J. McCune engineer, W. B. Alexander of Lafayette, Ind., assistant engineer, to mine in Elko county, along the Bruneau river, on which about 3000 feet of development work has already been done and buildings and machinery erected. The are two parallel ledges, 100 feet apart, workable by a tunnel, which will open them about 1000 feet down. The water power is more than required, while the ores are handled wholly by gravity. Construction of a mill is to begin at once.

## ESMERALDA COUNTY.

The Vulcan Con. C. Co., capital \$50,000, has been incorporated in West Virginia to purchase and operate the Vulcan copper mines. H. Siegel of New York is president, J. A. Bamberger of Salt Lake City is vice-president, and C. T. Champron secretary of the new company.

## LANDER COUNTY.

T. H. Dalton and F. W. Dixon of Austin have discovered a deposit of wolframite (tungsten ore) that appears to be of considerable extent.

J. A. Miller has sold the Morse group of mines at Gold Park, 35 miles west of Austin, to J. W. Cliff, who represents Des Moines, Iowa, people, for \$60,000.

## NYE COUNTY.

By an official survey Tonopah district is found to be in Nye county, 2 miles from the line of Esmeralda county.

There are about 650 people in Tonopah camp. It is said to be no place for a man to go for day's work at the present time, as all the ground is taken up and everyone is working his own lease. Butler, the discoverer of the camp, at present is paying the board of about sixty men who are broke. The mines have been bonded by Grass Valley, Cal., capitalists for \$336,000 until January 1, 1902.

## WASHOE COUNTY.

C. Norcross and Washington people have bonded two claims in the Pyramid district known as the Norton mine. The claims contain a ledge 12 feet wide, which prospects well in free gold. Four men have been put to work.

An important strike is said to have been made on an extension of the Wedekind or Reno Star property. Ore almost identical has been found. Considerable development has been made. D. C. Wheeler of Reno is interested in this property. The find is about 2 miles north of the Reno Star and is believed to be a continuation of the main lode as struck in the Wedekind and Bell mines. Work has been commenced on the claim immediately adjoining the Reno Star, and a shaft will be sunk to a depth of 400 feet to reach the lode.

## WHITE PINE COUNTY.

It is reported that a proposition has been made by a syndicate of copper men for the lease of the mines of the Chinaman Co. at a rental of \$20,000 a month for ten years, the lease to be conditioned on the showing of the 300-foot level. This proposition has not been accepted.

Owing to the fact that the Rocco-Homestake-Nevada Co., near Hamilton, is not willing to sign a five years' contract to sell its ores to the smelting trust, the management of the company has decided to hold them at Eureka until satisfactory arrangements for their sale under more favorable conditions are made. They will, however, continue production.

In the New Century mine at Cherry Creek a discovery of high-grade silver and gold ore has been made. It is now being extracted and shipped. This mine is the north extension of the Exchequer mine.

## NEW MEXICO.

## BERNALILLO COUNTY.

Nancimiento, located in the northwestern portion of the county, has been in operation about a year. The work done has developed several bodies of medium-grade copper ore. The Jura Trias M. Co. will

erect a matte smelting plant of 100 tons capacity per day. The company owns several claims in the camp developed to pay. The machinery for the smelter is on the ground, buildings are being constructed and it is expected that the smelter will be blown in in about sixty days.

J. A. Coram of Boston, president; E. L. White of Lowell, Mass., secretary; D. McVickey of Salt Lake City, Utah, general superintendent of the Albemarle & Navajo G. M. Co., operating mines, mills and smelters in the Cochiti district, have been looking over the properties of the company. Mr. Coram says the Albemarle mine is becoming richer with the deeper working and a higher grade of gold ore is now being mined, also additional purchases of improved machinery will be made.

## GRANT COUNTY.

From Hanover, known chiefly by association with the Santa Rita copper camps, is a report that a find of placer gold has been made there on Whitewater creek, which runs through the properties of the Boston Picket, the Lost Mine, the Tin Cup, the Rattler and the Eureka. The natives are earning from \$5 to \$10 per day washing gold in the most crude and primitive manner, with tin plates or any old thing. The location of the strike is southwest of Hanover, between Hall's station and the town of Central. Lode mining on the properties named, which are owned by a resident of Central, is carried on by lessees and shipments made to the smelter are said to have brought returns of from five to seventy ounces in gold to the ton.

## LINCOLN COUNTY.

The new town, Estey City, in the Oscura copper district, 15 miles west of Malaga station, is growing rapidly. A company store, warehouse and hotel is now up and in operation. There are also about thirty tents. A part of the machinery for the Estey plant is now on the ground, and Dr. Dryson, son-in-law of D. M. Estey, estimates that it will take sixty to ninety days to set up the machinery and get the leaching plant ready for operation.

## OREGON.

## BAKER COUNTY.

T. F. Rea, of Baker City, has bonded the Mormon group of mines at \$20,000 from Sage, Grace, Young, Shurtliff & Smith, the owners. Mr. Rea proposes to drive the deep tunnel under the pay chute.

At the Crown Point, near Sumpter, the tunnel is now in 650 feet and it is expected to tap the ledge soon.

Manager Bishop of the Climax mine, near Sumpter, reports that he has cleared the tunnel of the debris washed in from the breaking of the ditch. The blacksmith shop and toolhouse have been rebuilt, but twenty tons of high-grade ore, valued at \$6000, washed away by the flood, has not been recovered.

Claims of strikes in several mines and prospects in the Susanville district are made. The Badger mine is sending two carloads of ore daily to Whitney for shipment to San Francisco. The new postoffice will be opened at Whitney before July 1.

Manager A. Buckbee of the Virtue mine says the mine is being worked with twenty men, who take out enough ore to keep ten stamps going. There is a good prospect, owing to the steady increase in values, of the working force being increased.

Some promising discoveries have been made in the Bridgeport district.

The Oreol mine, in Robinsonville district, owned by L. D. Shoat, J. L. Baer and H. Fuchs of Baker City, has been bonded to J. F. Cupid.

## GRANT COUNTY.

J. F. Hardee of the Climax mine, at Granite, says a 19-foot ledge of gold-bearing quartz has been cut at the mine. At first it was thought the foot wall had been struck, but the find proved to be a large ore body in a slate formation.

## JOSEPHINE COUNTY.

N. B. Meade is engaged in development work in his mine on Jones creek. A 100-foot tunnel cuts the ledge, showing 5 feet of good ore.

Henderson & Scribner's mine, in the Wolf Creek district, has produced \$10,000 by primitive methods in a few months. The gold is found in a vein of porphyry and decomposed quartz.

The Granite Hill Con. mines, near Grant's pass, have been bonded to J. L. Wiggins of Minneapolis at \$75,000. The first payment is due Sept. 1, the remaining payments at intervals of three months. The property consists of placer and quartz workings. The placer grounds are a red gravel, easily worked and rich in gold. The quartz claims are equipped with a 5-stamp mill and other improvements. Development work will be done during the summer.

## UNION COUNTY.

A gold discovery has been made 12 miles southeast of La Grande. The surface ore assays \$50 to the ton. It is a tunnel proposition and easily workable.

## UTAH.

## BEAVER COUNTY.

B. F. Woodward, superintendent of the South Granite group, east of the O. K., reports that on the South Granite he has run an incline down about 20 feet, and opened up 10 feet of ore going from 40% to 57% lead, 5.5 ounces silver and \$3 gold per ton.

## GARFIELD COUNTY.

E. W. Stanton, manager of the Eastern company operating placer ground on the Colorado river, says that since the completion of the dredger it has worked smoothly and saves gold that amply justifies the investment. He said that he anticipated that the company would order at least one new dredger. The gold found in the river sands is very fine and difficult to save, and occasionally pay streaks are encountered in which the gold is as large as fine shot.

## JUAB COUNTY.

Secretary Wilkinson of the Mammoth Co. has reported that three cars, sixty tons, of ore from the 1700-foot level had been sold for a little more than \$5000, the controls showing 81 ounces silver and \$20.61 gold per ton.

## KANE COUNTY.

At the annual meeting of the Paria Copper Co., H. W. Hartley was elected president and J. L. Perkes of Salt Lake City secretary and treasurer.

## PIUTE COUNTY.

The Iron Mountain C. Co. has incorporated, capital \$50,000. D. J. Frew is president, E. Thompson vice-president, W. Houchen, Cedar City, Iron county, secretary and treasurer. The company owns the Oregon, Indiana, Illinois, Ohio, Texas and Iowa and a lease on five other mining claims.

## SALT LAKE COUNTY.

The U. S. M. Co. have let the contract for the main smelter building which is to be of steel, and is to be completed in four months.

H. M. Crowther, Supt. of the Tiawaukee-Winnemuck group at Bingham, reports that the Winnemuck mill was started up on the 13th with ore of good quality from the Tiawaukee.

Grading of the site of the United States M. Co.'s \$500,000 smelter has been begun by Gardner Bros. of West Jordan, the contractors. Dedericks & Burke have contracted the construction of the ore bins and trestles. The bins are over 700 feet in length, and with the elevated portion of the railway to correspond with them will require 850,000 feet of lumber. The Rio Grande Western Co. has begun work on the spur to the site. F. W. Nelson, who has just completed the Excelsior plant in Nevada, and who directed the work of the Santa Fe Co.'s new smelter in Mexico, is Supt. of construction.

## SUMMIT COUNTY.

The Golden Electrical Power & Transmission Co. has been incorporated, capital \$50,000, to provide an electric power plant and distribution for Park valley mines. It is proposed to use the water of George creek. H. Joseph and others of Salt Lake City are the people interested.

Local shareholders in the Quincy M. Co. of Park City expect the mine to pay a dividend early in July. Among those interested are Manager D. C. McLaughlin, E. F. Holmes, H. Newell, D. Keith, W. V. Rice, J. T. Clasby, J. Farrell, D. D. Irwin and W. W. Armstrong.

The Daily M. Co. has elected C. S. Rood president and general superintendent to fill the vacancies created by the death of R. C. Chambers. W. R. Wightman was elected secretary.

The Golconda of Park valley has opened up 2 feet of ore assaying an average of \$13 gold per ton. The strike, according to the management, was made on the 100-foot level.

The Silver Key group at Park City has been bought by Mrs. S. A. Daft, \$8000 being paid on an option at about \$40,000. She will begin development at once. The Silver Key is located upon the Crescent vein.

## TOOELE COUNTY.

The original workings in the Mercur mine were in the upper ore body, which pitches to the southeast, and from which the bulk of the oxidized ores came that kept the old Mercur mill running for a number of years. The newer workings, made since the consolidation of the Mercur with the Golden Gate, have been largely confined to the lower ore body, which has a similar pitch to that of the upper vein. The lower vein carries arsenical sulphide ores generally, excepting at the outcrop in Sacramento gulch, where they are oxidized. The Mercur mill was

not provided with roasters for treating the base ores, hence the operations which supplied it with ore were confined to the oxidized strata of the mine. The Golden Gate mill is specially equipped to treat the refractory ores, and when the consolidation took place last year that mill began to draw at once from the large bodies of arsenical sulphides of the Mercur mine, as well as the oxides, and the Mercur mill closed down.

The new work on the Mercur, which opens up such large reserves of base ore, is through a main tunnel that strikes southward, then westward, several thousand feet, cutting under the ore body in three places. Above this tunnel level are three other levels approximately 25 feet apart, each with a large amount of work in the shape of systematic blocking out on a horizontal plane. All these levels are connected with the main tunnel level by chutes and raises. All this work from level to level, including upraises, is in ore, with the exception of here and there a roll of lime. Ore shipments to the amount of about 800 tons per day are being taken from this newly-opened ore body. This is dumped into ore bins, which load into cars that are operated between the mine and mill by electric locomotives. The mill, which is now operating on about 1000 tons of ore per twenty-four hours, is supplied by the additional 200 tons from the Golden Gate workings, which are reached by a shaft that sinks near the mill. The great mill is automatic throughout, conveyors and elevators performing a large part in passing the ore from the crushing department through the roasters to the cyanide leaching tanks. The power consists of a heavy battery of steam boilers and two engines, which operate two electric generators. From the generators electric power is transmitted to a system of motors in the mill, by which the latter is operated.

The old Mercur mill at Manning is being put in condition to operate again, the idea being to leach the tailings which resulted from former operations.

The Sacramento mine and mill are operating, the mill treating about 150 tons of ore per day. The ore is about one-half oxidized, the other half being a black sulphide that carries no arsenic but considerable talc. For this base ore a roaster has been added to the mill. H. L. Benner is the manager.

The West Dip properties, comprising the Daisy, La Cigale and others, each equipped with a good mill, have been idle for some time. They experienced difficulty in making a satisfactory extraction of values. The matter of starting them up again is being considered.

The Northern Light mine is operating, but with a small force. The mill is idle at present.

The Chloride Point is being worked by a few leasers at present, the mill being idle. WASCOTT.

Mercur, May 25.

The Honerine of Stockton has 500 tons of ore in its bins and has commenced shipping. Manager C. H. Scheu says the ores on which shipments are resumed contain an average of 50% lead, twenty-five ounces silver and \$2 gold per ton.

## SOUTH DAKOTA.

## PENNINGTON COUNTY.

The Spearfish G. M. Co.'s mill, near Deadwood, is crushing seventy-five tons daily, and is adding eight more cyanide tanks, to increase the treatment to 200 tons daily.

## WASHINGTON.

## FERRY COUNTY.

Free gold has been found in a large body of decomposed quartz on the south slope Belcher mountain, near the wagon road from Republic to Marcus. The gold can be panned freely. A shaft has been sunk 16 feet on the ledge and a crosscut run 14 feet in quartz so soft that the work is done without blasting. Assays shows values of from \$5 to \$26 per ton.

There is said to be 3 feet of fineshipping ore in the face of the third level of the California, at Republic. On the second level the drift is all in ore of good grade. President H. B. Ives of New Haven, Conn., who visited the mine recently, is anxious to build a concentrator, and the matter will be laid before the company on its return home. It has been decided to install a compressor plant. It will be of the Leyner six-drill type. Supt. Delbridge says that the machinery will be on the ground by July 1. The shaft will be carried to a depth of 600 feet.

R. J. Davis of Daisy, Supt. of the Nonpareil M. Co., in Meteor camp, says: "The Nonpareil properties consist of seven claims. The property has 700 feet of development work. Drifting has been extended both ways along the vein for 200 feet and exposes an ore chute the entire distance. The vein on the tunnel level is from 4 to 6 feet, between two well defined walls, with a pay streak from 2 to 2½ feet, containing gold, silver and lead. A winze

was sunk on the west level to a depth of 30 feet, when water stopped sinking till a pump is installed. An average of the ore in the winze assayed \$74.26.

The Hawkeye Co. will install a compressor plant of three drill capacity and a steam hoist at an early day. Supt. J. L. Harper thinks the new plant will be running by the first of August. The shaft is to be continued to the 450-foot level.

#### WYOMING.

##### CARBON COUNTY.

C. Custer of Laramie has sold his one-quarter interest in the Rambler mine to A. E. Humphrey of Denver for \$100,000. Custer was one of the first owners of the mine, purchasing his interest for \$800, which he borrowed.

J. G. Rankin of Rawlins has Bessemer iron ore in the Ferris Mountain district that will run 60% iron. The lead is claimed to be over 80 feet in width, and traceable for 3 miles.

##### FREMONT COUNTY.

The Carissa mine continues development. Manager Tibbals says they are driving levels and opening stopes, so that any quantity of ore required for the mill can be furnished. When the company holds its annual meeting plans will be considered for further opening the mine, and for the construction of large reduction works. The placers of Atlantic, operated by the Dexter G. M. Co., are being worked under the management of C. G. Memmenger, M. E.

The new strike of Hoisington, Carr & Lyons is being opened up. They will sink a perpendicular shaft to water level and then crosscut to the vein.

#### FOREIGN.

##### BRITISH COLUMBIA.

C. H. Stillwell of Montreal has bonded the Walrus group of claims, in the Lardau mining division, from McKay & McKenzie, for \$80,000.

A new discovery of free gold has just been made near Nelson. Assays show values of \$24 in gold in the ore.

The Noble Five M. & M. Co. have contracted for a 320-foot tunnel to cut the Last Chance vein.

The Hampton group, near Slokan, has resumed operations. N. F. McNut of Silvertown, the owner, is operating it.

##### A. F. R.

The Mount Sicker & B. C. Dev. Co. will, it is said, develop their properties (sixteen claims) on Mount Sicker on a large scale. H. Croft, manager of the Lenora mine, is also manager for this company, which has \$100,000 in the treasury.

The Tyhee mine, at Mount Sicker, has had over \$100,000 expended in development to date, and good ore bodies have been opened up. The owners, an English company, intend to erect their own smelter.

The Key City claim, owned by Sacramento, Cal., people, at Mount Sicker, adjoins the Lenora on the west. Development work is being done.

The Hayes mine, on Alberni canal, is said to have 75,000 tons of copper ore blocked out. A tramway is to be built, so as to ship the ore economically.

The Monitor mine, at Alberni, is being developed and has made several shipments of copper ore to the smelters.

The Iron mine (copper), at Alberni, has made some trial shipments.

In the Magnetic iron claims, at Alberni, developments have been made with, it is said, very satisfactory results. This property and a number of other iron claims have been bonded by Americans, represented by a Mr. Swaney, who has also taken over the blast furnace at Port Townsend, Wash., which is to be started soon with iron ore from Texada Island.

##### Victoria, June 4.

S. W. Hall, manager of the Homestake mine at Roseland, says that the company will commence shipping ore on a commercial basis without delay, the development work and blocking out of ore bodies having been advanced to a point at which ore production in quantity can be maintained.

On Hardscrabble creek, Barkersville, W. C. Fry last week struck good pay—five or six ounces to the set—and is said to have considerable good ground ahead. W. A. Johnson of Quesnel owns the mine with Mr. Fry.

Cockle, Johnson & Isaacs, on Stewart's creek, near Barkersville, are working in good ground, with four to six ounces per set, and on the same creek, a mile above, Petrie, Smith & Co. own and are working drifting ground that is paying four to six ounces per set of timbers.

#### CUBA.

New York capitalists, including W. A. Chanler and C. Rand, have taken an option on many of the copper properties held by Spanish companies in the Cobre

district, Santiago Province, and have also a lease of the mines formerly worked by the Consolidated Royal C. M. Co. of London. The nature of the copper ore deposits in this locality is narrow and short veins. Hence the workings of the mines must be made deeper, requiring pumping. Experiments are now being made in the extraction of copper from the water with which the mines are flooded. At the San Jose shaft a pumping plant of 500 gallons capacity per minute is in use. On the Consolidated properties a natural flow of water is passed over scrap iron in the tunnel and the cement copper shipped to England yields \$600 per month, the expense of collecting the cement not exceeding \$10.

#### THE KLONDIKE.

A nugget valued at \$1020, weighing 63½ ounces, has been found on F. Phiscator's claim, No. 2 El Dorado. The ground was being worked on a lay by T. G. Edgar. This is the second largest nugget found in the Klondike. The largest found on Cheechaco was worth about \$1300. The piece is flat and has a little quartz in the sides. It was thrown in the sluice and not discovered until the riffles were cleaned.

#### MEXICO.

F. Sterling has sold to a Dunkirk, Ind., company his gold mining claims 80 miles south of Nogales. There are fifteen pertenences in the group, and the company have taken an option on 1000 pertenences adjacent. F. Sterling, of Nogales, Ariz., is manager, J. Bates, of Dunkirk, is president, and M. H. Sloan, of Dunkirk, secretary. R. Burnham has been appointed mine superintendent.

J. Sheridan, of Duluth, Minn., has recently bought the interest of A. C. Wright in the Tejada mine, in the Sahuaripa district, and is now associated with S. A. Williams of Hermosillo, Sonora, in its ownership. It is their intention to begin work upon the mine and push its development.

#### Books Received.

"Annual Report of the Smithsonian Institution," for 1899, published by the Government printing office at Washington, D. C., 672 pages, 8vo. In addition to the formal official administrative sub-reports and financial statements, the volume contains over 500 pages of general appendix treating of thirty subjects, selections of papers by the most advanced thinkers in many lines of physical research. These papers are interesting and instructive and do not show the weakness of many government reports in a vast waste of words, among which one must wander in search of surprises in thought. All that appears in this volume is the thought of thinkers, and well told, much of it being novel. The volume well fulfills the object of the foundation of the Institution, "For the increase and diffusion of knowledge among men."

"Bulletin No. 10-A—'Preliminary Report on Part of the Iron Ores of Georgia,'" by S. W. McCallie, Asst. Geologist of State Geological Survey of Georgia, 188 pages, illustrated and containing explanatory diagrams and maps. The report deals with the iron ore deposits of the counties of Polk, Bartow and Floyd, and shows care and thoroughness in the gathering of facts and clearness and intelligibility in their expressions. Among technical official reports on mines and minerals, it is in the same class with the Reports of the California State Mineralogist, and in some details rather an improvement. It can be obtained from W. S. Yeates, State Geologist, Atlanta, Georgia.

#### Commercial Paragraphs.

CHAS. M. HAMPSON, mechanical engineer and concentration expert, has just completed the installation of Bartlett concentrators in the new mills of the Cold Spring Mining & Tunnel Co. in Boulder county, Colo., and supervised the remodeling of the concentration department generally.

#### Personal.

VICTOR M. CLEMENT of Salt Lake City, Utah, is in New York.

JOHN B. FARISH of Denver, Colo., is in California, examining mining properties.

F. E. WARE, manager of the Mount Shasta mine, Shasta, Cal., is in San Francisco.

I. I. MINEAR of the Yankee mine, Custer, Idaho, is in Silver City, of the same State.

T. H. THEWEY of Canada has accepted appointment as Supt. Idaho M. & D. Co., Boise, Idaho.

W. G. PALMER of London is at Bingham, Utah, examining mines for the London Exploration Co.

S. F. HUNT, Supt. Pittsburg G. M. Co., operating in Bingham county, Idaho, is in Salt Lake City, Utah.

B. WARREN, underground Supt. of the Center Star mine at Roseland, B. C., is in Vancouver on a vacation.

ROBERT BURNHAM has been appointed Supt. of the Sterling claims, Sonora, Mexico, 70 miles south of Nogales.

E. H. BENJAMIN, M. E., of San Francisco, is at Hermosillo, Sonora, Mexico, examining a mining property.

PROF. W. H. KNIGHT of Los Angeles, Cal., has been elected president Southern California Academy of Sciences.

WILLIAM PEARCE of Virginia City, Nev., is in French Gulch, Shasta county, Cal., superintending a gold mine.

J. C. HADLEY of Silver City, Idaho, is at Unionville, Nev., as manager for the Nevada M. & S. Co. of St. Louis, Mo.

WALLACE MACGREGOR of Berkeley, Cal., has gone to Punta Arenas, Costa Rica, in charge of a mining proposition.

L. M. FRENCH, manager of the Blue Jacket mine in the Seven Devils district, Idaho, was in Salt Lake City, Utah, last week.

G. J. MCCARTY, manager Creston-Colo-rada Co., Minas Prietas, Sonora, Mexico, has returned to the mine from a visit to New York.

GEORGE E. ROBERTS, Director of the U. S. Mint at Washington, D. C., has been sojourning in Denver and Cripple Creek, Colo.

EUGENE HAANEL, professor of physics in Syracuse, N. Y., University, has been appointed Superintendent of Mines of the Dominion of Canada.

GRANT ROBINSON has resigned as superintendent of the mill at the Kendall mine in North Moccasin, Mont., and has gone to Nome, Alaska.

WM. MURRAY of Sierra City, Cal., has accepted an important position with a mining company operating in Corea and has gone to that country.

A. BORDEAUX, general manager of the Ralston Divide G. M. Co. of Placer county, Cal., has gone to Paris, the headquarters of the company.

F. SWINDLER, late superintendent of the De Lamar mine at De Lamar, Nev., has gone to South Africa to accept a position in one of the Rand mines.

DR. JOHN B. PORTER, professor of mining and metallurgy in the McGill University, Toronto, Canada, has been spending a few days at Grass Valley, Cal., examining the mines of that district.

PROF. S. B. CHRISTY of the University of California has gone to Europe with Architect Howard of New York to examine mining schools there for suggestions for plans for the new mines building of the University.

HERR KREUZER, Royal Inspector of Mines of the German Empire; Herr Horter, special agent of the German Government to inquire into the mining industry of the United States, and Herr Vogel-sang, mining engineer of Berlin, have been visiting Cripple Creek and Leadville, Colo. They are a commission appointed by the Emperor to make a thorough investigation of mining conditions and methods in the United States, and, after examining Colorado mines, will go to Utah, California, Oregon and Montana.

#### Catalogues Received.

The Sullivan Machinery Co. have issued Catalogue No. 46—"Bullock Diamond Prospecting Core Drill." The publication is more than a catalogue. It is a hand-book of practice replete with instructions for use, illustrated by drawings and containing records of costs of actual operation from which mine managers can estimate on their own special problems. It is a desirable book of reference on the subject of diamond drill operation. The catalogue can be had on application to the Sullivan Machinery Co., 135 Adams St., Chicago, Ill.

#### Latest Market Reports.

SAN FRANCISCO, June 20, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 50c San Francisco, 48½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £69 5s per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 8, sheet 8½, bar 5½c; pig, \$5.25. London, £12 7s 6d per ton=2.69 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb. lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13½c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 31c; bar tin, \$3, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.00 ½ flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 ½ lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS.—F. o. b. New York 50¢ 60c ½ lb.

ASSAY LITHARGE.—San Francisco, 10c ½ lb. small lots.

BISMUTH.—New York, ½ lb., \$2.25 50-lb. lots; San Francisco, \$2.50 to \$2.75 ½ lb. lots.

PLATINUM.—San Francisco, crude, \$22 ½ oz.; New York, \$22 per Troy oz.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

TUNGSTEN.—New York, ½ lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50¢ 60c ½ lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c ½ set; 14 oz., 40s., 9½c.

OILS.—Lined, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's' bbls., 60c; cs., 65c; No. 1 bbl., 50¢ 52½c; cs., 55¢ 57½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½¢ 33½c ½ lb.; carloads, 30¢ 31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½ B, 2c ½ lb.; soda ash, \$1.90 ½ 100 lbs. 58½; hyposulphite of soda, 2½¢ 3c ½ lb.; blue vitriol, 5½¢ 6½c ½ lb.; borax, concentrated, 7¢ 8c ½ lb.; chlorate of potash, 12¢ 13c; roll sulphur, 6c; al. m., \$1.90¢ 2.00; flour sulphur, French, 2½¢ 2½c; California refined, 1½¢ 2c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3¢ 4c ½ lb.; Cal. s. soda, bbls., \$1.00; sks, 95c ½ 100 lbs.; chloride of lime, spot, \$2.50¢ 2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

DEWEY, STRONG & Co.'s SCIENTIFIC  
PRESS PATENT AGENCY, 330 Market St.,  
F., has official reports of the following  
S. patents issued to Pacific coast in-  
ventors:

FOR THE WEEK ENDING JUNE 11, 1901.

676,293.—LOCK.—I. P. Abbott, Nevada City, Cal.  
 676,324.—PLATING PRESS—A. & C. H. Eberle, Downey, Cal.  
 676,126.—ADVERTISING DEVICE—J. W. Fawkes, Jr., S. F.  
 676,036.—ANIMAL TRAP—A. R. Hamilton, Los Angeles, Cal.  
 676,325.—BOX COVER BRACE—E. Kubias, Los Angeles, Cal.  
 676,094.—FIREARM—Linville & Endicott, Jackson, Cal.  
 676,070.—CAN COOLING MACHINE—E. Manula, Astoria, Or  
 676,073.—FISH CLEANING APPARATUS—Munn & Lotz, S. F.  
 676,370.—TOY PUMP—J. A. Robertson, San Jose, Cal.  
 676,243.—HITCHING FETTER—Rommel & Owen, Los Angeles, Cal.  
 676,342.—SAW SET—T. Roseboom, S. F.  
 676,400.—TIRE VALVE—J. A. Spencer, Los Angeles, Cal.  
 676,04.—PUMP—F. B. Warring, San Jose, Cal.  
 676,018.—CORE LOCK—J. L. Wilson, Los Angeles, Cal.  
 34,649.—DESIGN—L. P. J. Herring, Los Gatos, Cal.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MAGAZINE FIREARMS. No. 676,094. June 11, 1901. R. W. Linville, Gwin Mine, Calaveras Co., Cal. and E. E. Endicott, Jackson, Amador Co., Cal. This invention consists in the combination with a magazine of a breech bolt by which the cartridges are transferred from the magazine to the barrel, and a longitudinally slidable breech bolt by which the cartridges are transferred to the barrel of a mechanism, and connections whereby the parts are automatically actuated and the gun loaded and fired continuously until the cartridges are exhausted. There is also mechanism by which the discharges may be interrupted and the gun fired singly and successively by independent movements.

MOVABLE ADVERTISING DEVICES.—No. 676,126.  
June 11, 1901. J. W. Fawkes Jr., San Francisco  
Cal. This invention combines in an advertising de-  
vice a cabinet or suitable support, a constant  
source of power actuating sets of continuously  
moving endless chains in parallel planes, said  
chains having certain of their links provided with  
lugs upon which are pivoted frames between the  
chains in these various sets. There are means  
for mounting the chains by which these frames

retain a vertical position throughout their travel of translucent vertical columns mounted upon adjustable bearings, and means for rotating the columns intermittently. A spring bears against a pin upon the side of each column, and also against the column, and there are means for illuminating the columns.

FISH CLEANING APPARATUS.—No. 676,073. June 11, 1901. W. Munn and A. Lotz, San Francisco, Cal., assignors to Alaska Packers' Association, same place. This invention relates to an apparatus which is designed to receive fish, pass them through a current by which the heads are severed, thence to a trough in which the fish are held while the fish is opened, and to scrapers by which the insides are removed, and thence to cleaning brushes and washing devices, and finally to the discharge, the whole thing being conducted continuously and automatically.

If you are going to the Pan-American Exposition at Buffalo, or to Cincinnati, Detroit, Chicago, Milwaukee, or any point in the East, write or call upon Mr. D. W. Hitchcock, General Agent, Union Pacific R. Co., No. 1 Montgomery St., San Francisco, in regard to reduced round trip rates to these points. Three trains via this route leave California daily. The time of the "Overland Limited" to Chicago is less than 3 days and to Buffalo 3½ days, which is nearly a day quicker than any other line.

**WANTED, for a large mine in California, an experienced Mine Surveyor who can make plans in good style. Apply with full particulars of experience, copies of references and salary expected, to "Hercules," care of this office.**

**WANTED. — PROPERTIES CONTAINING MAGNETIC PYRITES or SULPHURETS** by parties who mean business. Address samples and particulars to Dr. Beecher, Oliver Hotel, Corner Mason and Pine Sts., San Francisco, California.

town in need of a telephone exchange will confer a favor by addressing "Telephone," care Mining and Scientific Press.

Full expert reports, maps and 90 days' exclusive options must be furnished. Have CASH CUSTOMERS for worthy properties.

---

**CORRESPONDENCE IS DESIRED**

P. W. PYNE, West Alameda, Cal.

**SUPERINTENDENT** of gold mine or mill desires position. Thoroughly experienced in mining and milling gold ores. Competent assayer, chemist and surveyor. Technical graduate. Salary moderate till ability is demonstrated. Address B. Sc., care this paper.

**POSITION** in charge of a gold mine or mill desired by a graduate Mining Engineer, who is thoroughly experienced in mining and milling gold ores as practiced in this country and Mexico. Can assay, survey, manage men, etc. Will accept a percentage of profits in a good company for part salary. Address "Engineer," care Mining and Scientific Press.

Eighteen years' practical experience in the West. Understand the mining and milling of ores for profit. Best of references. Address "Practical Miner," care Mining and Scientific Press.

who had experience with sulphide and carbonate copper and lead ores in California and Mexico, competent to design or take charge of smelter, wants responsible position as chemist, furnace boss or superintendent. Address "Metallurgist," care Mining and Scientific Press.

having taken a course in surveying, including practical field and office work, wishes position as chainman or work in any capacity with a surveyor, civil or mining engineer. Address M. S., Box 10, Standish, Cal.

**THE CALIFORNIA DEBRIS COMMISSION,**  
having received applications to mine by the  
hydraulic process from the following:  
Joseph Thomas Mine at Plymouth, Asador Co.,  
to deposit tailings in Indian Creek, and from S.  
Simmons et als., in the Victor Placer Mine, in  
Negro Canyon, Sierra Co., to deposit tailings in  
Charcoal or Negro Creek, gives notice that a  
meeting will be held at Room 59, Flood Building,  
San Francisco, Cal., on June 24, 1901, at 1:30 P. M.

and others is invited to the  
**DEAN-OVIATT ORE ROASTER AND  
 DESULPHURIZER**

**WELL WORTH YOUR INVESTIGATION!**  
**—Interest For Sale.—**  
**OFFICE, 321 PHELAN BLDG., SAN FRANCISCO.**

544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential*.

## 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

**EVERY ONE A SUCCESS AND MONEY MAKERS.**

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

**THE BEST MANUFACTURING COMPANY,**

# CALKINS' AUTOMATIC CUPEL MACHINE.

(PATENTED.)

BEGINNING COMPRESSION.

COMPRESSION.

EXPELLING CUPEL.

## 600 PERFECT CUPELS AN HOUR.

**A**N ARRANGEMENT of levers multiplies the amount of power, applied to the end of handle, twenty times, and the cupels made by this machine are perfectly homogeneous, giving greater power of absorption. The feed is entirely automatic, making the cupels of a uniform thickness; and they are expelled with a perfect edge. We make a table and a wall machine, employing the same principles but with a hand feed. These appliances are in use in all parts of the world and make perfect cupels.

## THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its  
Advantages :

Wearing parts reduced to a minimum. All parts are interchangeable.  
Will take ore from finest mesh up to 6-mesh without sizing.  
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.  
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD.  
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

THE COLORADO IRON WORKS CO.,

Established 1860.

DENVER, COLO., U. S. A.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

# The Robinson "Wonder" Concentrator.

PATENTED AUGUST 27, 1900.

**The "Wonder" Placer Mining Machine.** The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. **LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING.** A 1-inch stream will furnish ample water for a 50-ton per hour machine  
CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

## CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from  $\frac{1}{4}$  to  $\frac{1}{2}$  greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

## WHAT OTHER PEOPLE SAY.

The International M. & D. Co., Canton, O.

MATÁPE, SONORA, MEXICO, April 23, 1901.

GENTLEMEN:—"Our machine is truly a 'Wonder.' It is without a question the greatest machine of the kind I have ever seen in all my 47 years' experience in placer mining. A number of times I have had the machine fed up to 20 tons per hour and have held my hand in the water so that I could feel the gravel as it passed along the bottom and over the rim of the pan, and the bottom of the pan was clear at the time, showing that we might have fed it much faster without fear of choking it. I have panned over a hundred pans from the tailings of our machine, and have not yet found a single color in them. The machine is correct in principle and is absolutely perfect as a gold saver. It saves the finest gold, even flour gold."

Respectfully,

T. R. ANDREWS.

ELKHORN, COLO., April 13, 1901.

GENTLEMEN:—"Your 'Wonder' Placer Machine is the greatest gold saver I have ever seen. One boy and myself are washing with the 18-inch, hand power machine, 2 tons of gravel per hour. I will recommend your machines to all miners who want a first-class placer machine."

Respectfully,

A. Y. GORDON.

**MINING INVESTOR**, Colorado Springs, Colo.

**THE S. H. SUPPLY CO.,****THE MACHINERY DEPOT OF THE WEST,**

22d and Larimer Streets, DENVER, COLO.

During the past three months we have dismantled three mills: the Royal Gorge Mill, Canon City; the Oneida Reduction Works, Victor, Colo., and the Gold Brick Mill at Gunnison, Colo. The first of these was in actual operation less than thirty days; the second, ninety days, and the third one year. In all of these mills amalgamating machinery was used, and the consequence is that we have a great assortment of this class of machinery. For use it is as good as new in every respect. We are offering this machinery at a saving of from 50% to 75% over the cost of new machinery. We have:

- 14 Standard Amalgamating Pans.
- 78-Foot Settlers.
- 4 Cleanup Pans.
- 8 Amalgam Safes.
- 15 Quick Elevators.
- 4 Amalgam Cars.
- 5 Quick Tanks.
- 3 Retorts and Bullion Furnaces.

Two of these mills were dry crushing, containing the following roasting and drying machinery:

- Howell Improved White Roasting Furnace (60x37).
- 3 18-Foot Revolving Ore Dryers.
- 1 Bruckner Roasting Furnace.
- 1 40-Foot Pierce Roasting Furnace.

All of these plants were fully equipped with power, including Corliss engines (18x42); tubular boilers and Heine water tube boilers; feed water heaters, and pumps.

Thousands of feet of rubber and leather belting, shafting, pulleys and hangers are in our warerooms. Write for our prices.

The air compressors we have in stock and can make immediate shipment on, are:

- 12x14 Ingersoll-Sergeant.
- 18x14x10 1/4 Norwalk.
- 12x14 Rand.
- 10x12 Knowles Belt Driven.
- 6x8 Knowles Belt Driven.

Our new catalogue is just issued and we will send you one if you ask for it. It contains a large amount of good information in regard to prices, as all of them are put in plain figures. No discounts. Send for it.

**THE S. H. SUPPLY CO.,**

22d and Larimer Streets,

DENVER, COLORADO.

**THE SAXTON Steam Wagon & Automobile Company.**

THE ONLY CRUDE OIL STEAM WAGON IN THE WORLD.

We build to order **STEAM WAGONS**, suitable for all kinds of heavy hauling on mountain roads. Our wagons can be staked down and the engine used for driving other machinery. These wagons are safe, practicable, reasonable in cost, and money savers in actual use. Correspondence and investigation solicited.

Address: **STEAM WAGON & AUTOMOBILE COMPANY,**  
**J. C. SAXTON**, PRESIDENT. WORKS: 515 SIXTH ST., SAN FRANCISCO, CAL.

**Crocker-Wheeler Company,**

MANUFACTURERS AND ELECTRICAL ENGINEERS,

Announces the establishment of its Pacific Coast branch office and warehouse at Fremont and Howard Sts., San Francisco.

**ABNER DOBLE COMPANY,**  
MANAGERS.

Direct-Current Machinery for all purposes. Engine-Type Generators, Belt-Type Motors and Dynamos. Fully and Semi-Enclosed Motors, Mill, Elevator and Hoist Motors.

Main Office and Works, Amper, N. J., U. S. A.

**FORGINGS.**

WE ARE EQUIPPED TO MAKE

**IRON and STEEL FORGINGS,**

BOTH LARGE AND SMALL, OF ANY DESCRIPTION. WE CAN MAKE LOW PRICES AND GIVE QUICK DELIVERY. LET US HAVE AN OPPORTUNITY TO QUOTE.

American Engineering Works, 204 Dearborn St., Chicago.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Old., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

### The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

## PATENTS

DEWEY, STRONG & CO.

(ESTABLISHED 1860.)

SAN FRANCISCO, CALIFORNIA,  
and WASHINGTON, D. C.

OLDEST AND LARGEST AGENCY ON  
THE PACIFIC COAST.

WHY TO BE PREFERRED?

BECAUSE--

First: Inventors have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that all the inventor's ideas will be correctly conveyed, avoiding mistakes and vexatious delays.

Inventors living at a distance from San Francisco may, where they so desire, consult directly with our Washington office.

Inventors receive the benefit of over thirty years' continuous, successful experience.

A description of the patented invention will appear in the Mining and Scientific Press.

We have a complete Patent Library, including official records since 1793 and full certified copies of all patents issued since 1873. These are for free examination by any one who desires.

We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches, and give opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete. Inventors' Guide sent free on application.

## PROFESSIONAL CARDS.

**R. H. POSTLETHWAITE, M.E.E.**  
**Hydraulic Mining Engineer.**  
 River Dredging for Gold a Specialty.  
 1815 Leavenworth St., San Francisco, Cal.

**THEO. F. VAN WAGENEN, E. M.**  
**Consulting Mining and Hydraulic Engineer.**  
 1072 Josephine St., DENVER, COLO.

**D. B. HUNTLEY,**  
**Mining Engineer and Metallurgist,**  
 De Lamar, Owyhee Co., Idaho.

**BERNARD MACDONALD,**  
**Consulting Mining Engineer.**  
 General Manager British America Corporation, Ltd., Rossland, B. C.

**S. W. TYLER,**  
**Mining and Metallurgical Engineer,**  
 8 Windsor Hotel Block.  
 Cable: Retyl, Denver. DENVER, COLORADO.

**J. W. CURRIE,**  
**ASSAYER,**  
 12 W. Third South St., Salt Lake City, Utah.

**W.M. A. AKERS,**  
**Consulting Mining Engineer,**  
 521 Dooly Block, SALT LAKE CITY, UTAH.

**EDWARD L. HAFF,**  
**MINING ENGINEER,**  
**U. S. DEPUTY MINERAL SURVEYOR.**  
 Mine Examinations and Reports.  
 National Annex Block,  
 P. O. Box 31. CRIPPLE CREEK, COLO.

**E. H. BENJAMIN, Mining Engineer.**  
**A. M. HUNT, Mechanical & Hydraulic Engineer.**  
**WYNN MEREDITH, Electrical Engineer.**  
**C. L. CORY, Electrical & Mechanical Engineer.**  
 EXPERT EXAMINATIONS. ADVISORY REPORTS.

## POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.  
Send us your inquiries.

SEND FOR PAMPHLET.

THE PNEUMATIC CYANIDE PROCESS CO., 306 Boston Bldg., Denver, Colo.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE GOLD AND SILVER EXTRACTION CO. OF AMERICA, LTD.

TESTING WORKS, 1716 BLAKE ST.

208-210 MCPHER BLDG., DENVER, COLO.

## Prospecting Machinery.

Multitudes in use for testing for minerals. Sizes and equipments to suit any and all conditions. Unexcelled for Placer Testing, Oil Wells, Water Wells, testing for Lead and Zinc, Iron and Coal; goes through anything; brings up everything. Large sizes drill as much as 1500 feet. In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 8vo; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc.; and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

The Greatest Book on Petroleum in any Language.

## PETROLEUM:

Its History, Origin, Occurrence, Production, Physical and Chemical Constitution, Technology, Examination and Uses; together with the Occurrence and Uses of Natural Gas. Edited chiefly from the German of Prof. Hans Hoefer and Dr. Alexander Veith, by William T. Brann, author of "A Practical Treatise on Animal and Vegetable Fats and Oils." Illustrated by 3 plates and 284 engravings. 736 pages, 8vo. Price, \$7.50.

ABSTRACT OF CONTENTS.—Chapter I. Introduction; History of Petroleum; History of the Petroleum Industry in the United States, Galicia, Roumania, Russia and other countries. II. Division and Nomenclature of Bitumen. III. Physical and Physiological Properties of Petroleum. IV. Chemical Constitution of Petroleum. V. Occurrence of Petroleum. VI. Origin of Petroleum. VII. Boring, Conveyance, Transportation. VIII. Crude Oil. IX. Manufacture: Distillation, Condensation, Refining, Continuous Distillation, Production of Lubricating Oils. X. Manufacture of Paraffine. XI. Methods of Testing Oils. XII. Uses and Properties of Petroleum. XIII. Natural Gas and Gas Oils. Appendix. Index.

This volume will be sent by mail, free of postage, to any address in the world, or by express C. O. D., freight paid, to any address in the United States for \$7.50.

A circular of 8 pages, with specimens of the illustrations, showing the full Table of Contents, will be sent free to any one furnishing his address.

# THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested  
by our own and our customers' experience during the past twenty years.  
They are being used by more than nine-tenths of the prominent Ameri-  
can engine builders, who are good judges of lubricators. Many of these  
have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use,  
or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our  
new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

# THE BRETHERTON HOT BLAST.

APPARATUS FOR PERSISTENT SMELTING. It saves fuel, increases capacity of furnace, im-  
proves character of work, does not require a hot top causing volatilization like other inventions, fur-  
nishes pure air heated without cost, can be attached to furnaces already in use, is an all around money  
saver, built and used by practical, successful metallurgists. Write for particulars to

## GENERAL ELECTRIC COMPANY'S

### Electrical Mining Apparatus

Does away with long steam piping, and of leaking compressed air joints. It saves the miner from the high temperatures due to steam piping, it preserves the mine timbers through the absence of moisture, and costs far less for repairs and renewals than any other system of mine operation.

**ASSESSMENT NOTICES.**

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of May, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of July, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
EDWARD H. STEARNS, Secretary.  
Office—Room 801, Claus Spreckels Building, San Francisco, California.

**INYO MARBLE COMPANY OF CALIFORNIA.**—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of May, 1901, an assessment (No. 34) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of July, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 6th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
CHARLES E. ANDERSON, Secretary.  
Office—Room 31, tenth floor, Mills Building, San Francisco, California.

**WILLIETTA MINING & MILLING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of June, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 8, 206 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
FRANK E. CORDES, Secretary.  
Office—Room 8, 206 Sansome street, San Francisco, California.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of June, 1901, an assessment (No. 23) of ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
ALEX. GRANGER, Secretary.  
Office—Room 223 Crocker Building, San Francisco, California.

**TANANA MINING COMPANY.**—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of June, 1901, an assessment (No. 3) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 13th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
EDWARD H. STEARNS, Secretary.  
Office—Room 801 Claus Spreckels Building, San Francisco, California.

## Wooden Smelter Stack at Mapimi, Mexico.

Written for the MINING AND SCIENTIFIC PRESS by WM. MAGENAU.

Accompanying is given an illustration of a unique construction of smelter stack, which commends itself for cheapness and durability under such conditions, especially as remoteness from brick manufacturing centers and low price of timber.

The stack shown was built by the Compania Minera de Penoles at Mapimi, Durango, Mexico, in 1897 at a cost of about \$10,000, Mexican currency. It is estimated that a brick stack of the same capacity would have cost \$40,000. It is 180 feet high and 10 feet square, the body being constructed of ordinary 1-inch matched flooring lumber, and inside of this is a lining of No. 22 corrugated roofing iron. The bracing, which is a permanent part of the structure, is built of 4x6 inch and 6x6 inch timber with a little 8x8 inch. It was built in six weeks, a contractor and one carpenter being the only white men employed, cheap Mexican labor doing most of the work. Lumber at Mapimi cost at the time \$60, Mexican, per M. feet.

Danger of fire seems at first thought the greatest objection to this kind of stack; but, with a few simple arrangements and proper watchfulness, any serious trouble from this source can be avoided. In three years steady operation this stack has been afire only three times, and was then promptly extinguished. A platform has been built every 40 feet and at each a length of hose attached to a 2-inch water main is provided. When the iron lining burns out at any point the issuing smoke is noticed at once from the yard below, and, all parts being quickly accessible, serious damage is averted. The lining lasts well, the Mapimi stack being in good condition after over three years of service with highly arsenical fumes from between four and six sixty-ton blast furnaces.

## The Renaissance of Mines.

The mining of to-day is in many localities a revival of successful exploitation where it was supposed there was nothing to exploit. Great metal values are coming not only from new discoveries in new districts, but as well from a renaissance of old mines in old districts. There are fashions in mines as well as in lighter things. After the discovery of gold in California, and for a dozen years following, this State dominated the imaginations and pockets of men. It was the only gold land—the only territory for the investment of capital in mines, and gold mining was the only mining. A great industry for the time was developed, hundreds of gold mining propositions were promoted, great mills were erected, and all flourished like weeds in a California spring-time till the fashion of putting money in California gold mines was changed by the dazzling yield of the Nevada silver mines.

Silver mines and Nevada then for a dozen years and more were the source and

Wooden Smelter Stack, Mapimi, Mexico.

scene of the wealth-getting activity in mining. The Comstock, first always, then White Pine, Eureka, Austin, Pioche, Candelaria, drew men and wealth, built cities and fortunes, all on silver, in Nevada, till again the resources of promotion and quick bonanza returns lagged and fashion in mines turned again her face, and the followers of the fickle dame spread over new lands and in turn sought other metals and many strange minerals.

Utah, Arizona, Colorado, Idaho, Montana, Oregon, South Dakota and, notable in foreign countries, the Australian colonies, New Zealand, Transvaal, Mexico, British Columbia and the Klondike, together or in turn each has been the fashion for mines. In some the hold on public interest has been unbroken. The older exploited districts, like California and Nevada, had brief glories of intense effort and dazzling yield of metallic wealth, to be followed with longer periods of silent rusting machinery, caving underground works and decaying structures.

These mines of past days are now again becoming the fashion. The last ten years have witnessed renaissance after renaissance of mines of old mining camps in the Nevada and Arizona deserts, in Colorado and Oregon mountains.

The miners of forty years ago will remember the Lost Confidence mine of Shasta, Cal., that allured and wrecked the hopes and pockets of many a miner in the old days. Now it is the Mountain Mines, Ltd., and earns enormous dividends for people who never saw a mine. When in the old days it was the first fashion, it was the gold face of the shield men saw; later other men looked on it and said shield was silver. The men who look on it not at all, now say it is copper.

Truly, there is nothing so fickle as the fashion of mines—except the mines.

THE low price of lead and the consequent depressing effect on silver-lead ore production are turning the attention of British Columbia miners to gold mining, and the experience of Colorado is being repeated. Numerous gold-bearing lodes and districts are being discovered and explored with exceedingly encouraging development. While no new Cripple Creek is reported, the prospects seem good for the making of a gold mining industry that will soon exceed in magnitude the diminishing silver-lead mining.

A SUBSCRIBER writes us from Lead, S. D., that he suggested to Senator Pettigrew the idea of a home for old prospectors some six years ago. This paper hopes more of its readers will do the same thing—suggest to United States Senators and Congressmen and delegates to the Mining Congress at Boise, Idaho, the idea of a home for old prospectors. It is quite properly a matter on which the Mining Congress can make a declaration of what it deems just and generous in recognition of the services of men who pioneered for the mining industry.

THE Electrical Review, in discussing the conventions, pertinently suggests that the places selected for meetings should preferably be watering places or small cities, combining natural beauties, good hotel accommodations, and an absence of features tending to draw away the attention of members, rather than the great cities, where there are overpowering counter attractions. The suggestion has an added pertinence here in the far West, where the convention habit has developed the art of convention exploitation among our thrifty, hospitable people. Really, a convention in San Francisco has little time left, and the members little opportunity left, after accepting the good will and attractions showered on them, for the real business of a meeting. Perhaps it's just as well, in the end, but the meetings have legitimate purposes and it would seem that conditions and environment should be provided to keep these purposes clearly in the fore of everything else. San Francisco has been mentioned, among others, as a place for the next meeting of the International Mining Congress that meets this year at Boise, Idaho. Los Angeles would be a better place, a better still would be Santa Catalina island. That would be almost ideal. There is no telegraph, no telephone, no railroad, no daily paper. There is charming natural beauty, a climate that inspires mental effort and rests the body, and hotel accommodations all that could be desired.

## The Position of Lead Mining.

The price of lead at \$4 to the miners at the smelters has been kept up by the latter since the beginning of 1900. That is to say, left to itself without the support of these selling interests the price of lead, fixed by buyer's demands for consumption, and the uncontrolled supply of production, would have been below \$3 a hundred, possibly as low as \$2.50. At a comparatively slight reduction below \$4 many of the lead-silver mines operating would have had, first, the profit margin for mine dividends wiped out, and ultimately would have been forced to shut down or operate under a heavy loss, which is unthinkable. The contracts under which the price has been kept up to the miners, terminating on Jan. 1st next, the question of the new contracts to go into effect then are now up for consideration between the mine operators and the American Smelting & Refining Co. The contract offered by the smelting company is not acceptable to the mine operators.

On its part the smelting company, speaking through one of its principal men, J. B. Grant, claims that "the company is doing the best it can to build up the price of lead at a heavy loss, as everyone knows who looks into the matter, and there must be a reduction or there will come a break that will be ruinous. At \$4 per 100 pounds the producers are receiving a cent a pound above the market. There is no justice in holding the smelter company responsible for a situation which it has no means of controlling. The fact that there is an overproduction is well known, and ordinary commercial rules cover all matters of that kind."

On the other hand, the miners who deal with the smelting company admit that there is an overproduction of lead for the lead market. They claim, at least the Cœur d'Alene lead-silver mine operators do, that they are paying \$1 a ton more for transportation and treatment than paid under the contract preceding the existing one, and that since March, 1901, at the request of the smelting company, they have been restricting their production one-third. The request of the smelting company was the statement that they had 40,000 tons of surplus pig lead in stock and 25,000 more tons in ores, and in order to reduce this they must decline to receive the full mine production. Generally, the mine operators claim that they can not operate their mines at a reduction in the price of lead.

Both parties agree on the fact of overproduction. There can be no reasonable question as to the fact that the smelting company is doing the best it can to build up the price. Its statement of surplus stock demonstrates that. Its claim that it is doing so at a heavy loss to itself is not as convincingly obvious as general acceptance of the statement would imply. The recent consolidation of the rival smelting companies made public through judicial findings of fact that one of the two companies that made the new company put its property into it for \$45,000,000 out of \$100,000,000 of the total capitalization, with an exhibit of actual cash investment in plant and operative capital of not more than \$23,000,000. It is not to be presumed that the other company did any more proportionally, so that its cash investment representing \$55,000,000 of the new capital would be about \$28,000,000. This would make \$51,000,000 cash investment for the present company, or, to eliminate any question of understatement of cash investment and cash capital, place it at \$70,000,000. The company recently declared a dividend on its common stock at the rate of 7% a year. In addition, it paid dividends on its preferred stock and interest on its bonds. In round numbers its net earnings have been between \$12,000,000 and \$14,000,000 a year—between 17% and 20% on \$70,000,000 of investment. The smelting business has thus paid the smelting company as a whole even if it did sell lead for less than direct cost to it. Accepting the claim of heavy loss as a fact—though the authoritative statement of numerical value in dollars of "heavy" would be a valuable aid to a clear comprehension of just what the phrase means—the net earnings of the smelting and refining of gold, silver and other metals must have produced the \$12,000,000 to \$14,000,000 of net profits and in addition the numerical value of "heavy" loss.

Briefly, the final net profits of the entire smelting business do not appear to be reduced, and the "loss"

by buying lead for more than it is subsequently resold for has been, so far as the smelters were concerned, an additional cost charge on the treatment of gold, silver and copper ores. It is not the smelting company which has made a loss from the lead smelting, it is the miners of other metals. The recent raising of charges by the smelting company is part of the business of passing this loss to the other metal miners. A comparison of the total net profits of the smelting company with the total value of the smelting company production at sale values of the metals other than lead, and with the net earnings of the mines that supplied the ores of these metals, cannot fail to be instructive and suggestive to the mine operators, who, rather than invest their own capital in reduction works, legitimately part of their mining business, pay for that service the larger part of their possible profits. It might be suggested that treatment by custom smelters may make a mine but it certainly does not make a good business.

The claim that there is no justice in holding the smelter company responsible for the situation which it has no means of controlling may be conceded without argument. It would seem, however, that its maintaining of the price above the market is in part responsible for the creation of the situation. It has made a profit for lead-silver ore mining in mines that could otherwise not have operated, and it has stimulated the opening of new mines, not alone in its own buying field, but in the competing Missouri district as well. The artificially maintained profit-earning price has been to the lead-mining industry a medicine which, postponing the penalty settlement for overproduction, has meanwhile increased it and made it chronic. It would have been much better industrially for the few to have lost in the beginning rather than that the many should lose now. But the smelting companies could not have made their net earnings of the last two years so large without the use of the surplus of lead-ore production, and some lead-silver mines would not have paid dividends. These facts may be conceded too. On the other hand these mines and more will have to shut down now indefinitely unless the smelting company abandons finally the effort to maintain the price of lead and treats it simply as a by-product of its smelting operations, buying it from miners like limestone or other fluxing material. It will have to pay miners a profit on mining, or own its own mines. It may have to increase treatment charges for other metal ores to correspond with the increase in its cost charges. It would risk in so doing the offering of the quantity of those ores. It risks the maintenance of its present high rate of earning. But, on the other hand, by substituting a true basis of operation for a false one, the general business of mining has some of its risks eliminated and is to that extent made more safe and surely profit earning.

The preceding has suggested the heroic remedy for the industry, namely, the business recognition of the facts of overproduction and the basing of future business in the industry on the fact that the condition is permanent. Lead consumption will not expand under low prices very largely. It is not like copper consumption. Reduce the price of copper a few cents, and it displaces aluminum for many uses; a few cents more, and it becomes a substitute for steel and iron for many services; a few cents more, and it displaces, directly and in alloys, more of these and other metals. Consumption with copper closes immediately on an increased production, which lowers the market price. It is not so with lead, and there is more lead than copper that is minable. It does not seem as if increased use could absorb overproduction with lowered market price.

The plan of a combination to restrict production is suggested. One practically exists now except as to the inclusion of Missouri lead mines. The suggestion then means that the Missouri mines shall enter into the practical combination that already exists between the smelting company and the Rocky mountain lead miners. What have the Missouri mine operators to gain by such action? What have the other two parties to give? It is not difficult to see the smelting company as an almost sure beneficiary of such a combination. The Rocky mountain miner of the purely lead-silver ores might make a less amount than at present, but would be making something. The Missouri miners, however, would have to be insured a larger profit from a high market price and a

small production than he can get from the low price and a large production. Mining costs in Missouri are low—principally labor; investment in plant is small compared with investments in the Rocky mountains, smelting costs are lower and refining is not required to the extent at least that the Rocky mountain lead requires, and transportation to market is but a fraction, not more than one-fourth of the costs against Rocky mountain lead. The market price can be lowered far down below present price and yet leave a profit that would be taken as fair compensation by Missouri miners. If they cannot make a profit a shut down makes little or no loss to operators. Perhaps the Missouri miners can be induced to join a combination that will keep the price of lead high enough to make it pay both the smelting company and the Rocky mountain miner. But the Missouri miners will have to be paid. Who will pay? The silver-lead miners claim they cannot stand a reduction in the price of lead, or even the chance of it; they cannot then pay anything. The smelting company could pay by taking it from the net profits of its smelting and refining business other than lead. The Rocky mountain miners of gold and other metals could pay, but why should they? It is not their business that is in need of medicine.

A combination of this nature has another natural destroyer that has to be reckoned with. The advance of metallurgical science is resolving many complex ores carrying lead as a constituent of minor value. These ores carry gold enough, alone, or value enough in the gold and recoverable metals other than lead, to make their mining profitable, and the lead is then an unavoidable by-product which will go on the market for sale at any price. The amount of lead product from these ores is increasing rapidly independent of the market price of lead, and if there be made a combination to restrict production, this lead production will get a premium at the expense of the combination production just exactly as Missouri lead production is receiving one now.

Summarizing, there is a chronic condition of over-production of lead. Left to itself, the market price would descend below the cost of production from Rocky mountain lead-silver mines, and the restriction of production to a new and lower market price level would be effected by the closing down of mines that would not pay. The price might be maintained by an all-embracing combination, but the motive—profit from such combination, to induce the joining of the controlling, least costly production—would seem hard to provide. On the other hand, the smelters must have the lead ores to smelt and refine gold and silver ores. A limiting of the quantity they use makes a limitation in the quantity of other ores they can treat. Treating other ores without limit, the only position of lead is as a necessary component of furnace charges, that must in marketing take a value independent of its cost.

Should large-consuming new uses be found for lead that would sustain the price, this summary would be modified accordingly.

THE State is ready to buy a quarter of a million dollars worth of redwood lands for a State park in the district known as the Big Basin in Santa Cruz and San Mateo counties, an appropriation of \$250,000 having been made for that purpose by the last Legislature. At a meeting held in this city on Tuesday, Governor Gage presiding, a resolution was adopted declaring the commission ready to receive proposals for the sale of lands, and it was also proposed that only such tracts of lands as are contiguous to each other be bought. The commission will visit the basin in July or August.

### Concentrates.

THE Canadian Minister of the Interior has promised that an assay office shall be established at Victoria.

PRESSED STEEL BARRELS are now manufactured and are extensively used for the transportation of oils and other fluids.

THE United States in 1900 again took first place in the production of gold, \$118,435,562 as compared with \$99,158,948 in 1899.

THE cost of making a barrel of cement in a mill that makes 1000 barrels a day is about \$1. The greater the output the less the cost.

CAST IRON is comparatively a modern invention and dates only from the beginning of the fifteenth century,

though wrought iron was known in the time of the pyramids, more than 3000 years B. C.

A TRIAL COURT in Colorado has decided that the State law requiring mine owners to board over or fence shafts can not be enforced, as it is included in a statute, the title of which declared the object of it to establish the State Bureau of Mines.

IN a wooden car, weight 30,000 pounds empty, and 60,000 pounds loaded, the ratio of load to full weight when loaded is 66.67%, while with a pressed steel ore car of 100,000 pounds capacity the ratio of load to total loaded weight is about 78.1%.

THE utilization of blast-furnace gases in gas engines has been so successful that half of the gases from a furnace producing 150 tons of pig iron a day will produce in gas engines 3500 H. P., while the same gas used to make steam in boilers will only produce 1000 H. P.

A SUCCESSFUL system of dust fuel burning has been worked out in connection with cement manufacture, and from it a system of boiler firing that is reliable and economical has been developed. With the use of the dust fuel the combustion is so perfect that there is no smoke.

FROM the study of the chemistry of the soil, it has been determined that the most barren lands can be made capable of supporting plant life by the addition of potash, phosphoric acid and nitrogen. The latter can be accomplished largely by culture in plants absorbing nitrogen from the air.

THE metric system of measures is exclusively employed in all the countries of continental Europe except Russia and there its employment is not only permissible but common. The export of U. S. manufactures is at considerable disadvantage through the use of the English measures.

IN 1880 the United States produced only 42,000 barrels of Portland cement. In 1895 the production was 1,000,000 barrels; in 1896, 1,500,000 barrels; in 1897, 2,677,755 barrels; in 1899, 5,650,000 barrels; in 1890, over 7,000,000 barrels, and for 1901 it is estimated it will be about 12,000,000 barrels.

THE State of Wyoming through Prof. Knight of the State University has arranged for the making of geological surveys and map of Laramie valley. The work will be done by the U. S. Geological Survey, Prof. Knight being appointed to the field staff of the survey to facilitate the carrying on of the work in co-operation.

PROF. HENRY LANDIS, State Geologist of Washington, with his assistants, Prof. Solon Shedd, D. A. Lyon and W. S. Thyng, will organize parties and begin the geological survey of the State of Washington. The first work will deal more particularly with economic geology and the assistance of all engaged in mining is solicited for the gathering of preliminary data.

CONGRESS has not yet made any change in the mining laws requiring assessment work to be done by October 1st of each year. The Senate Committee on Mining has recommended such a change to be made. Probably it will be, but the chance of its occurring based on experience in getting desirable changes made by Congress should not be permitted to alter arrangements for assessment work made in advance for many years.

THE petroleum producing area of Canada is in the southwestern part of the Province of Ontario. It contains in operation about 9000 wells, average pumping depth 465 feet, yielding nearly 60,000 barrels monthly. The ratio of crude petroleum to refined oil is about 100 to 40, requiring two and one-half barrels of crude to make one of refined. The manufacture is complicated and plant expensive, but from the mud-colored petroleum the final product is an illuminating oil clear as water.

A 10 H. P. GAS ENGINE with ordinary city gas at 54 cents per 1000 feet will cost for operation per H. P. hour \$0.019—\$1.90 for the 10 H. P. for ten hours. With the city gas at \$0.81 per M. cubic feet, the H. P. cost will be \$0.025 or \$2.50 for 10 H. P. for ten hours. With the gas at \$1.35 the cost per H. P. hour will be \$0.037 or \$3.70 for the engine for the ten-hour day. These costs correspond respectively to charges for electric power at \$0.0253 per K. W. hour, \$0.0335 per K. W. hour and \$0.0496 per K. W. hour.

THE standard requirements for tensile strength of cements have been increased till they are beyond what is required for ordinary work. Manufacturers have improved the tensile strength as rapidly as the requirements have been increased. A test for tensile strength gives a relative figure which can be used for comparison with some other cement, the value of which in use is known by experience and time. To make comparisons with former tests of any value, however, there must be a uniform method of making the tests which must be strictly followed.

MOLYBDENITE, sulphide of molybdenum, is quite a common mineral. Worthless until quite recently, its present commercial importance is for the purpose of making an alloy of the molybdenum with iron for certain desirable grades of steel. For this purpose the manufacturers first make what is called ferro-molybdenum, containing 50% of the latter. The latest New York quotation for this is \$1.25 a pound. The demand is limited and it is not probable that the price will be maintained long. The high price received by the first miners of a commercial deposit has stimulated research, and reports of discoveries are com-

ing from many localities. To be of commercial value the shipping grade of ore should not run under 50% of the mineral. The only buyers are the steel manufacturers.

THE Sweepstake placer mine, in Trinity county, Cal., was not formed by glacial action. It was formed long before the glacial epoch. In the Sierra Nevada mountains in California, where the geological phenomena have been very thoroughly studied out, the old gravels that contain gold are all pre-glacial. In fact, the evidence is conclusive that even the canyons of the present rivers are pre-glacial. On the eastern slope of the Sierras are some gold-bearing gravels that are glacial deposits; but even in these it is clear that most of the gravel and the gold were pre-glacial and only transported to their present place by glaciers which formed and moved in the old stream channels. Weaver Basin, the valley of Weaver creek, in which the town of Weaverville is located, and which has been noted for its enormous yield of gold, situated east and adjoining the Sweepstake placer, has been described as of glacial origin. The bedrock beneath the gravel is very deep, and is a depression which, the writer is informed, has no natural drainage from the bottom. On this structural anomaly seems to have been based the theory that the gold-bearing gravel filling of the depression was of glacial origin. The glacial deposit has been claimed to be a moraine 30 miles long and several miles wide, extending from Coffee creek on the north to the Trinity river, south of Weaverville. The La Grange hydraulic mine is considered to be in a part of this old glacial moraine. In this mine there are some evidences of glacial origin, but they can hardly be regarded as conclusive. In Weaver Basin the writer has observed no evidences of glacial origin of the deposit that are not with equal weight of reason referable to the ordinary phenomena of stream erosion. North of Weaverville, to Coffee creek, the gravels are covered with volcanics which are pre-glacial. The Sweepstake deposit seems to be nothing else but an undisturbed fragment of the first channel of what is now the Trinity river. It can be regarded as older than Neocene, the age given to the auriferous gravels of the Sierra Nevada mountains. It would seem to have a close connection in origin with the old river gravels and sands extending from a point 30 miles up the Klamath river to the sea coast at Gold Bluff. The land area of the mountain mass, including the Trinity watershed, is as old, if not older, than the land area now the Sierra Nevada range. Like the latter, it has been subjected to enormous sub-aerial erosion, and, like it, to enormous changes in regional elevation. Both denudation and changes of elevation are evidenced in the enormous thicknesses of the Cretaceous beds which lie on the eastern edge of the old land mass. These beds have been measured 30,000 feet in thickness, the material for them being derived largely from the erosion of the Trinity area of the land mass. Also, the submergence of the land-filled bedrock depression of the old channel of the Klamath at Gold Bluff and a high uplift of the Cretaceous beds are indicative of tremendous changes in elevation. These agencies all combined can reasonably account for the phenomena of the Sweepstake mine, without reference to glaciers. The Klamath river, above the junction with the Trinity at Orleans Bar, is comparatively a recent stream. It belongs to the period subsequent to the Neocene uplift succeeding the formation of the Cretaceous beds. The old Klamath main stream was the old Trinity. The latter, in Trinity county, in the headwaters region, has had certainly two, and very probably three, successive moves eastward from the line of which the Sweepstake is part to the present channel. The Sweepstake fragment seems to the writer clearly of the first and oldest of the channels. That fact alone would insure its being the richest. It can hardly be said to be an isolated fragment. There are other smaller and more or less richer fragments which seem to be parts of the system of river deposits of that age. One of them is at an elevation of over 7000 feet, on Mount Stirling. Another is west of Oro Fino, near the summit of the Salmon mountains. A third is the gravel channel, carrying gold, on the summit of the Salmon mountains occupying the pass between the headwaters of Coffee creek and the South Fork of the Salmon river. And there are a number of other points, all high up on the slopes or even the summits of the main mountain uplift; so that while the evidence of stream erosion formation was plainly to be read in the placers themselves, their position seemed inexplicable on that theory. The explanation is: Great age and enormous regional movement extending through several geological periods, during which the area has been continuously land. The Sweepstake is a larger remnant of this enormously old erosion—that is all. It is notable that in all of these deposits much of the gravel has disintegrated and become fragmental. It would seem as if Weaver Basin, in addition to its own erosion, represented in its gold and gravel the secondary accumulation of both from eroded portions of the older deposit. The same is probably the case with the La Grange hydraulic deposit. There is, however, nothing inconsistent in glacial phenomena having contributed to their formation; but the contribution of formation was a minor element of the real origin. An inspection of the maps of northwestern California, particularly the geological maps of the old Klamath area—island it is called by Diller and others of the U. S. Geological survey; but the island condition was only during the later Cretaceous; before that, during the early Cretaceous, it was part of the continental land mass, as it is now—an inspection of these maps will illustrate the logical basis on which the preceding statements are based.

## Blaine County, Idaho.\*

[STAFF CORRESPONDENCE.]

When, in 1884, the Wood river branch of the Oregon Short Line was built 60 miles northward from Shoshone, the chief interest centered in the lead-silver mines near Hailey, Ketchum and Bellevue; and while that class of mining here was much depressed for a number of years, there has been a steady improvement during the past three years, due mainly to the good price of lead and the closer methods of mining and concentration. This lead belt extends from Bellevue northward to a point above Ketchum, in the main lying on the west side of Wood river. The following are the names of the principal silver-lead mines of the belt, with the approximate record of their production between 1886 and 1900:

|                        | Average value per ton. | Total output. |
|------------------------|------------------------|---------------|
| Minnie Moore.....      | \$124                  | \$ 6,416,737  |
| Bullion.....           | 166                    | 1,309,037     |
| Queen of Hills.....    | 124                    | 995,598       |
| Idahoan.....           | 115                    | 899,525       |
| Mayflower.....         | 204                    | 883,275       |
| Red Cloud.....         | 96                     | 705,928       |
| Jay Gould.....         | 126                    | 536,640       |
| Red Elephant.....      | 96                     | 346,822       |

| Caledonia.....         | 171                    | 2,574         |
| Garfield.....          | 117                    | 1,908         |
| Totals.....            | \$118                  | \$12,940,431  |

During the depression from 1893 to 1896 most of these properties were practically closed down, and those which have since then resumed have done so under lease.

The Red Cloud is operating under lease to Lytleton Price, the title being in a trustee for the former ownership. The holdings embrace two veins, which were opened at the surface and worked downward. Some time ago a deep tunnel was driven to crosscut the veins, the effort not having been successful by reason of a faulted formation at that depth. However, at a point 2600 feet from the tunnel entrance an upraise was made 300 feet to the lowest working level, through which the ore from all the levels is conveyed to the tunnel level by a double-drum gravity tram line, carrying a cage in one compartment and a counterpoise in the other. The ore is shipped out through the tunnel. Within the last one and one-half years about 1800 tons of ore have been shipped, which brought \$127,000. While in the main this is a lead-silver ore, the above product included \$20,000 in gold. Part of the ore is milled through a jig and table concentrator situate at the mouth of the tunnel. The Red Cloud is on Deer creek, 6 miles west of Hailey.

The above-named mine belongs in the original lead-silver belt, but the following information pertains to the more recently developed gold belt, which is located 10 to 14 miles west of Hailey. Exploration and development here show that there are three east-west fissures cutting through a granite formation, but apparently along porphyry dikes. The Tip Top mine is on the center fissure, the Hattie and Jumbo on the north, and the Golden Star and Black Cinder on the south fissure. These leads are  $\frac{1}{2}$  mile or more apart. On the Golden Star there is a granite hanging wall and a porphyry foot wall, but it is said the order is reversed in other mines.

The principal property of the gold belt, so far as development and production are concerned, is the Tip Top. It belongs to J. Q. Packard of Salt Lake City, and has been opened, developed and equipped under the superintendency of J. A. Lusk. The development is through two incline shafts, 550 feet apart, each following the dip of the vein. The west shaft goes down 500 feet from a point on top of the hill. The east shaft sinks 700 feet from a point 150 feet lower. The first, second, third, fourth and fifth levels pass along the vein from one shaft to the other. The sixth and seventh levels are being run westward from the east shaft, cutting below the base of the west shaft. Drifting also follows the ore at various levels eastward from the east shaft, the work having gone 150 feet at one level. The vein stands 30 to 70 feet wide, carrying gold in an iron and copper pyrite gangue, being heavy in iron and quite siliceous. The vein matter contains much porphyritic material, the ore streaks often running between bodies of porphyry. Most of the ore is hoisted through the east shaft, dumped into bins, the latter discharging into cars, by which the ore is delivered to the crusher at the top of the mill. From the crusher the ore passes

through automatic feeders to the four 5-stamp batteries, each stamp being an 850-pounder, dropping about ninety-five per minute. Below the battery are amalgamating plates, on which about 30% of the saving is made. The material passes from the plates to four corrugated belt concentrators, which make a heavy, coarse concentrate. The tailings from the latter pass to hydraulic sizers, which make a separate sizing for each of the six smooth-belt vanners on the floor below, on which the final products are made in the form of finer concentrates. The product will run about 40% iron, the silica having been reduced to 6% or 8%. The waste tailings pass to settlers, the clear water is drawn off to a sump and pumped to a tank near the top of the mill to use over again. A considerable volume of water used in the mill comes from the mine, but the great bulk is pumped from a well a mile or so down the gulch, where there is a large pumping plant. The mill is operated by a Corliss engine and a set of Scotch marine boilers. At the mine is an ample steam hoist and an air compressor. The mill is handling fifty to sixty tons of ore per day.

North of the Tip Top, on the north fissure, is the Hattie, on which the ore body has been uncovered by considerable open cut work. A shaft is to be sunk on the vein and a tunnel is to be driven to cut 150 feet under present workings. The ores thus far obtained are well oxidized, heavy in iron, with a small percentage of copper, and are said to carry an average of \$10 gold to the ton. A 20-stamp mill, with plates and concentrators, is being completed, and which is expected to be operating within a few weeks. H. H. Cullum is manager, the Hattie G. & C. M. Co., who own the property, being Scranton, Pa., people, L. H. Hollister and W. W. Watson being largely interested.

South of the Tip Top, on the south fissure, is the Golden Star mine and mill, in charge of H. J. Allen. Here the incline shaft, following the dip of the vein, sinks 550 feet, a level on the vein being run from 100-foot stations. On the first level is 300 feet of drifting, there being 800 feet on the second, 700 feet on the third, with work progressing on the fourth. The work on the fifth has just commenced in ore. This mine makes a good supply of water, the pumps handling 50,000 gallons per day, which is used in mill work. The ores are an iron pyrite, in a white quartz, carrying about \$10 gold, that mills about 40% free. The mill has ten stamps, with plates and concentrators. The concentrates carry about 15% iron and 2% silica. They are milling twenty-five to thirty-five tons per day.

The Black Cinder mine, in charge of Jas. A. Doniphan, has been confined merely to development work. The shaft is now to a depth of 500 feet. A drift on the 400-foot level discloses two lenses of ore 80 feet long, consisting mainly of a ferruginous quartz, carrying gold, silver and copper. The ores on the 250 level were largely silver. At the 500-foot level a well-oxidized ore was found, which carried with the gold values about 25% lead and a little native copper. The Black Cinder pumps handle about 50,000 gallons of water per twenty-four hours.

The Idaho Recovery Co., whose work here is in charge of H. R. Case, is just finishing up cyanide work on old Camas No. 2 mill dump, and will now move the plant southward to another similar dump, where there are about 7000 tons of material. They will leach that at the rate of about seventy tons per day. The material will run \$3 gold and \$1 silver to the ton. Mr. Case figures on making an extraction of about 80%. The work here is rather difficult, as the material contains considerable iron, antimony and copper; but, having laid exposed for years, an oxidation has taken place, forming a sulphate of these elements, which are largely eliminated or neutralized by application of a wash water prior to cyanide work. As the acids are constantly forming during the treatment, a neutralizing agent is added in the tanks. About one pound of cyanide is used here to one ton of material.

The Jumbo group is in the same gold belt, but is 3 or 4 miles west of the Tip Top mine. The Jumbo belongs to the Idaho Milling Co., whose stockholders are mainly Burlington, Vt., people, D. Mackenzie being manager. The vein here stands between a porphyry hanging and a granite foot wall, and will doubtless average 40 feet in width. Much of the ledge matter is composed of a white quartz, granite and decomposed talc, carrying pay streaks of quartz, bearing free gold, with iron and lead sulphide. It is said the values will run about \$10 gold and three to four ounces silver. A 10-stamp mill has just been finished, having amalgamating plates and Hallet tables. The mine has been opened through four tunnels, each of which cut to the vein; on the latter there are nearly 400 feet of drifting and upraising. The levels are all connected, excepting the third and fourth. Water is delivered at the mill through a 700-foot flume.

The Junction group, belonging to W. T. Riley and others of Hailey, lies west of the Hattie. It is opened through an 80-foot shaft, on the vein, and a 200-foot crosscut that cuts through ledge showing 15 feet width of ore that runs \$10 to \$12 per ton. A second crosscut has been driven to cut the vein 300 feet below the upper tunnel, where a similar width of ore is shown that runs \$15 per ton.

The Liberal and Maggie May group, 25 miles west

from Hailey, is being opened by drifts on the vein. This is at a high altitude, near the east of the range. It belongs to Maj. Reed and others of Boise. The ore is quite free-milling and is said to be of excellent grade.

The Croesus, only 4 miles west of Hailey, has been closed down a number of months, pending negotiations for a sale. Manager Page is expected to return from the East soon and resume operations.

The ore shipments from Hailey comprise mainly high-grade lead-silver ore from the lead belt and concentrates from the gold belt.

A projected enterprise of much interest to this locality is an electric power plant at Hailey, where the Wood river furnishes ample volume and fall for water power. If the mines of the gold belt prove as good as anticipated, electric power could be transmitted to the mines and mills in that section to the great advantage of their operators.

Hailey, May 31.

WASCOTT.

## The Utilization of Tin Clippings and Tin Scrap.\*

When first I turned my attention to the subject, I found that large quantities of tin scrap and galvanized iron were every day carted to the dumps.

I found that the average coating on scrap tin, as tin on tin plate, was 3%; that the iron, if properly cleaned, could be used in the nobbling furnace and in the puddling furnace; that the use of galvanized iron was a necessary part of the process; and it looked so encouraging that we decided to build a plant to work it on a commercial scale.

I procured a half dozen of the larger beer casks used for storage, and which are about 6 feet in diameter and 6 feet deep. After removing the heads, they were placed in the ground in a semi-circle and a crane was rigged up that commanded all the tanks.

In the first tank was charged hydrochloric acid; in the second, water; in the third, water with a little lime; in the fourth, water; and in the fifth, a solution of copper sulphate.

The plan of work was to fill a large wooden cage that would hold loosely about 200 pounds of the clippings. This was swung on the crane and placed in No. 1 tank. In ten minutes' time the crane was raised and the clippings examined to see if the tin was dissolved. If so, the cage was then lifted out of the acid tank and another cage filled with clippings took its place. The cleaned scrap was washed in the water tank No. 2, lifted up and down to well wash it, and then immersed in the lime tank, No. 3. This neutralized all the residual acid that was left in the pores of the iron. The untinned and limed scrap was then moved to water tank No. 4 for a final washing, then plunged for a moment, just enough to submerge it, in the copper sulphate solution, then immediately removed. The object of this treatment was to form an exceedingly thin film on the iron, to prevent the rusting of the clean iron, which is so sensitive when exposed to the air that it will almost immediately cover itself with rust. The cleaned scrap was compressed in a drop press into balls, and in this form was shipped to the iron works and worked into blooms for sheets, commanding a price of from \$10 to \$12 per ton.

After the process had been continued for some time, all the acid in No. 1 tank would become neutralized and we would have a solution of chloride of tin.

The process of tin cleaning stopped here for a while. We then took a cage of galvanized iron scraps, filling the cage loosely. When the zinc came in contact with the tin solution, the metallic zinc took the place of the tin, forming zinc chloride, and all the zinc was precipitated as metallic tin, in a finely divided state. We worked this plant successfully for some time, recovering, when melted into ingots, about 600 pounds of tin from ten tons of scrap. The recovered iron commanded \$10 per ton and the zinc chloride \$20 per barrel, for disinfectant purposes and for treating wood to make it fireproof.

We finally closed the works because of the objectionable vapors that annoyed our neighbors, with the intention of rebuilding on the swamps near Chester; but other things prevented us doing so. I yet think it is the best and most profitable means of utilizing this scrap, especially if electricity is used for the disposition of the tin.

[The salmon canneries and the fruit packing canneries of the Pacific Coast using annually enormous amounts of tin plate, accumulate enormous amounts of clippings, which, in many observations of the writer, are simply thrown away and wasted. The suggestion of the above is particularly worth considering in relation to the economic disposition of the scrap. The tin in bars reduced from this waste would have an immediate market at from 25 to 30 cents a pound, and even the scrap iron is salable at about \$10 a ton. There is an opening for profit in the reclamation of this waste that should not be overlooked any longer.—Ed.]

## The Caliche of Southern Arizona.\*

In southern Arizona and in Mexico the word caliche is in general use to denote a calcareous formation of considerable thickness and volume found a few inches, or a few feet, beneath the surface soil, upon the broad, dry, gravelly plains and mesas.

In western South America the same name is applied to the beds of crude soda-niter (Chili saltpeter). While these deposits of South America and of Arizona are totally different in composition, and have nothing in common, except that both occur in layers in the strata near the surface, it is probable that an explanation of the origin of the calcareous beds may equally apply to the accumulation of soda-niter and other deposits of easily soluble minerals. But the name, taken from the Latin, Calx, is more appropriate to the calcareous beds than to those of niter.

Caliche has a wide distribution in the arid regions of Arizona and Mexico. It is usually hidden from view by a slight covering of soil; but it is easily found by digging, and is often revealed by a flow of water during heavy rains. It is practically a continuous sheet, from 3 to 15 feet thick, of earthy limestone or travertine, through which the smaller plant roots find their way with difficulty. The presence of this comparatively impervious layer of cemented earth may account for the absence of trees, or of the larger shrubs, over wide areas. The shrubs which gain a foothold are those whose roots do not extend far downwards, and which do not require much water, such as *Larrea Mexicana* and the *Cactacea*. If trees are planted it is necessary to break up the caliche by blasting, or at least to crack the upper layers. The top of the caliche is more dense and solid than the lower portions. The surface of this top crust, or layer, is comparatively smooth, though undulating, while the lower portions, under the crust, are irregular, cavernous, earthy and very porous, blending gradually with the materials of the sandy and gravelly beds, from which they are divided by no sharply defined plane of stratification or separation. The caliche invests, surrounds and includes sand-grains, gravel, and more or less earthy material, but seems to have had the power, especially in its upper crust, of extruding the coarse materials of the soil to a great extent.

The deposit does not form a regular horizontal bed conformable with the rude stratification of the gravels and sands, but conforms roughly with the general surface, rising and falling with the undulations of the mesa. There are, in places, repetitions of the compact layers, separated by a few inches of the amorphous and more earthy deposit.

In cross-fracture, this upper crust of the caliche exhibits distinct, fine lines of successive layers, in thin sheets, along which the rock splits with some ease, while there is a rude columnar fibrous structure transverse to these layers, sometimes in divergent lines from below upward. Close observation detects in some places small perforations, like pin holes at the top, which enlarge gradually below and penetrate the entire compact crust, becoming lost in the irregular amorphous granular mass. These holes are often occupied by rootlets of plants; but this is not regarded as evidence of any connection between the deposition of the caliche and plant life—a cause of deposition to which great importance is attached by some authorities. The caliche is an example of deposition independently of the influence of organic agencies.

In chemical composition the caliche is essentially a lime carbonate, but contains some calcium, magnesium and aluminum silicates, as more fully shown by the result of an analysis made by my assistant, J. S. Mann, in the laboratory of the Arizona School of Mines:

|                                               |       |
|-----------------------------------------------|-------|
| Calcium carbonate ( $\text{CaCO}_3$ ).....    | 78.28 |
| Magnesium carbonate ( $\text{MgCO}_3$ ).....  | 2.13  |
| Calcium silicate ( $\text{CaSiO}_3$ ).....    | 5.57  |
| Aluminum silicate ( $\text{AlSiO}_6$ ).....   | 7.37  |
| Ferric oxide ( $\text{Fe}_2\text{O}_3$ )..... | 1.88  |
| Moisture ( $\text{H}_2\text{O}$ ).....        | 1.20  |

96.43

This caliche, unlike the deposits of travertine formed in the open air, is not sufficiently compact and solid to be useful in construction, as was the travertine of ancient Rome. When calcined, it yields good caustic lime, which, tempered with sand, makes a strong, quick-setting mortar or cement. It is quarried and used for this purpose in some places. Occurring, as it does, in mixture with gravel and sand, it has the appearance of an artificial mixture, and as such was once supposed to have been laid down as a foundation by the builders of the Casa Grande in Arizona. On the line of the Phoenix & Prescott railway, it has been found that railway ties last longer when laid in the caliche than in ordinary soil. Analysis of this caliche showed that it did not differ essentially from the caliche of other places.

The great plain or mesa of Tucson affords one of the best examples of the occurrence of the caliche. This mesa, which appears like a great plain, is in reality a combination of gentle slopes from the surrounding mountains. The area within which the phenomena of the caliche are shown is probably not less than 400 square miles, and lies between the

Santa Catalina mountains on the north, the Rincon and Rillito mountains and the Santa Rita ranges on the east, and the Tucson mountains on the west. Toward the south and northwest the country is open in the direction of the valley of the Santa Cruz. The Santa Cruz and the Rillito are the visible channels of drainage; but there is, in addition, an extensive underground flow of water as widely spread, possibly, as the area mentioned, but probably strongest in volume under and near the river channels draining to the northwest. The general altitude of the mesa above the sea is from 2400 feet at Tucson to 3000 or 3400 feet about 20 miles eastward. These declining slopes are formed, for the greater part, of the debris of the surrounding granitic and gneissic mountains—the "wash" or gravel and sand which has been washed out from the canyons through ages of erosion. As a rule, these materials are rudely stratified, the coarsest, heavier gravels lying nearest to the mouths of the canyons. In a well 90 feet deep, near the University, on the mesa about 5 miles from the channel of the Rillito, the following beds were passed through, but the strata were not sharply defined:

### SECTION OF THE MESA, TO WATER LEVEL.

|                                            | Feet. |
|--------------------------------------------|-------|
| Soil, sandy and porous.....                | 1     |
| Caliche.....                               | 6     |
| Sand and gravel.....                       | 12    |
| Argillaceous earth (red).....              | 2     |
| Sand (red).....                            | 2     |
| Caliche, soft and amorphous.....           | 2     |
| Sand, hard.....                            | 6     |
| Sand and gravel ("cemented").....          | 3     |
| Sand cemented and aggregated in lumps..... | 11    |
| Argillaceous earth (red).....              | 3     |
| Argillaceous earth and sand (red).....     | 30    |
| Sand and boulders mixed.....               | 8     |
| Water in sandy bed.....                    | 4     |

Most of the sand and gravel not enveloped in caliche was found well filled with small sparkling crystals of calcspar, which appears to be the cementing substance holding the grains of sand together.

Wherever these gravels have been pierced by wells in the vicinity of Tucson, an abundance of water has been found at a depth of from 80 to 90 feet, or even less, depending upon the altitude of the surface. This water seems to be inexhaustible; at least it is in such quantity, and flows so freely, that the pumping plant at the University can be run continuously, discharging a 6-inch stream, without exhausting the supply in the well.

The general composition of this underground water is shown in the annexed table, compiled from the records of the chemical laboratory of the University of Arizona.

| $\text{CaSO}_4$ .....          | 1.0                        | trace      | 0.5             | 0.0               | 0.5         | 0.5    | 1.74               |
| $\text{SiO}_2$ .....           | 3.0                        | 2.0        | 2.0             | 2.0               | 2.0         | 2.0    | 3.10               |

It is probable that, in the course of the underground flow of the water from the higher levels towards the Santa Cruz, there are considerable areas of basin-shaped depressions in the bedrocks, where water accumulates and is more sluggish in its movement. So, also, there may be ancient channels, determining a more rapid flow than in other places; in each case there may be a difference in the amounts of solid matters held in solution.

There has been much speculation in regard to the origin of the caliche. It has been generally assumed to be a deposition from some ancient lake, or body of water, once covering the area in which it is found. But such a theory is untenable when all the phenomena are considered. The formation is clearly the result of the upward capillary flow of calcareous water, induced by constant and rapid evaporation at the surface in a comparatively rainless region.

With a constant supply of phreatic calcareous water, the second great essential force in the formation of caliche is the continued desiccating atmosphere—a condition which prevails, with only short and temporary exceptions, throughout the year. The desert and semi-desert regions of Arizona are characterized meteorologically by the unusual dryness of the air and its capacity for the absorption of moisture, and the maintenance of continued evaporation from the soil, which determines a constant upward movement of the phreatic water. The occasional rains in midsummer and midwinter do not penetrate to great depths, but are sufficient to leach

out the soil to the depth of a few inches or feet, turning the calcareous solution back and downwards, and producing the denser upper crust, where it meets the upward flow.

Such I conceive to be the origin of the caliche. It may be called a subterranean deposit of travertine; but it is not the result of a flow from springs, or from any source at the surface, or by the lateral movement of water. Unlike ordinary travertine, it is the result, not of descending, but of ascending currents. The ordinary conditions of vadose circulation are reversed. The caliche is a fine example of the formation of extensive calcareous strata in the midst of pre-existent beds, not by metasomatic processes, but by precipitation from sources below.

This explanation may apply equally well to some other subterranean deposits in arid regions, where the upward flow is maintained in excess of any downward percolation. It may apply, possibly, to the origin of soda niter, of some beds of gypsum, and of some of the metallic sulphides. In fact, the phenomena of deposition of ores in mineral veins are here repeated in kind, though not in form, over broad and approximately horizontal areas, so as to make bedded deposits, instead of fillings of fissures.

Surface deposits of soluble salts, such as the chlorides, sulphates and carbonates of the alkalis, are familiar to all residents of the arid regions. The "black alkali" of the Salt River valley in Arizona, so injurious to vegetation, is an example of the concentration, by evaporation at the surface, of solutions of carbonate of soda. The white efflorescences on the soil in the dry seasons, known to the Mexicans as *tequisquita*, are familiar examples. These deposits become snow white in a dry time and quickly disappear into the soil during a rain storm.

The presence of caliche in the soil over extended areas in the arid regions I regard as good evidence of the existence of subterranean water. The possibility of a change of conditions since the deposit of the caliche should, however, be considered.

I have elsewhere directed attention to the possible enrichment of the upper portions or croppings of mineral veins by the upward flow of solutions formed by the decomposition of the ores above the permanent water level in arid regions, and, conversely, the impoverishment of the croppings of lodes in regions of abundant precipitation, where downward circulation predominates. The copper deposits at Ducktown, Tenn., afford striking illustrations of the latter process.

### A Safe Ladder for Chimneys, Stand Pipes or Other High Structures.

A ladder of a new design was recently noticed on a factory stack in Germany by an American engineer, W. B. Cogswell of Syracuse, N. Y. It is a particularly advantageous construction for some purposes and an improvement on the usual style employed. The rungs of this ladder are made as shown in the accompany sketch. The idea is that a man climbing to the top of this stack gets inside of these rungs,

New Form of Stack Ladder.

where he is much more secure than upon the ordinary ladder, as he cannot be blown off, and feels much more safe than when he is outside, besides which he can at any time rest himself completely by standing with both feet and his elbows upon the rungs of the ladder at the same time, or if he likes can have a piece of plank 30 inches long with him, which he can put across one of the rungs and stand upon, thus making himself perfectly secure while working. It is Mr. Cogswell's belief, and we agree with him, that all chimney ladders should be made in this way.

While the cut shows the ladder applied to a brick chimney, there is no reason why similar ladders should not be applied to steel plate chimneys, water works stand pipes, or any other lofty structures to which ladders are attached.—The American Machinist.

A GERMAN PATENT has recently been issued to Dr. Heraeus for a process of producing a platinum coating on porcelain. The surface of the biscuit is coated with the preparation of platinum salts described in the patent, and then heated to a sufficiently high temperature to fuse the coating. The surface thus becomes covered with a conducting covering of platinum, which is very durable and much less expensive than the thinnest sheet. This is stated to be economically adapted for the manufacture of resistances, as the film can be made continuous for considerable length and yet of high resistance and great durability.

\* W. P. Blake, F. G. S., in Proc. Am. Inst. Min. Eng., Feb., 1901.

### A Problem of the Apex.

TO THE EDITOR:—A mining claim (Colorado) is located with its lode line and lode passing through the end lines, as shown in the diagram. Some time afterward the claim (Azure) is located with its lode line and lode passing through the end line also, as shown in the diagram. Third in point of time is the location (Verde) with a vein or lode belonging to it (A—B) passing through the side line of the Colorado at the point B, 150 feet from the corner, and passing through the end line of the Colorado at C, 100 feet from the same corner. The lode dip is toward and under the Verde. The question is, can the Colorado follow the dip of this vein beyond its side line under the Verde?

H. S.

Mohave, Cal., May 31, 1901.

The courts have made two different constructions of the law where the apex line of a lode crosses a side line of a claim on an end line. One construction has been that at the point where the apex of the vein intersects the vertical plane of the side line the right of mining in that direction was terminated by the plane of an imaginary end line parallel to the location end lines of the claim, and that the vein within these two planes (the original end line plane crossed, and the end plane of the imaginary end line) carried with it extralateral rights exterior to the other side line. The other construction has been that no extralateral rights attached to a vein so bounded. It would seem, however, that the last construction would produce the greater number of inconsistencies and that the first-stated construction is the conclusive one. Accepting it, the Colorado owns the linear extent of the lode between the points B—C, and the right to mine it extralaterally downward under the Verde between the vertical planes of the parallel end lines C—O and B—S. The Verde owns the apex

Diagram of Conflicting Claims.

between the points A and B and the right to mine downward extralaterally between the planes of the end line A—S and B—S until they intersect. The Verde, being a later location, has only what has not been previously appropriated. So that, while to technically comply with the law requiring the parallelism of the end lines its terminal boundary would be the imaginary line B—O, the actual end boundary is the imaginary line B—S previously fixed by the older Colorado location.

A question can be raised, it would seem, as to whether or not the Verde is a valid location at all. That is, if there is no lode in it crossing the two end lines of the location. The law has always recognized the validity of location on the presumed general direction of the apex of the lode where it cannot be precisely determined at the time of making the location. But the law does not permit the location of over 300 feet of width on each side of the apex of the lode. The Verde (if the lode A—B be the only lode in it) has nearly 600 feet on one side, where the apex is within its surface lines, and for several hundred feet it has 600 feet width of surface ground without any lode at all from which to initiate the claim. Patent, of course, vests title in fee, so that if the Verde were once patented the question could not be raised. But, being a location merely, it is a grant dependent on compliance with conditions, one of which is the limit of appropriation of side ground. If the locator finds as a fact that he has not complied with this condition, is he not legally bound to make compliance with it by amending his location by changing his side lines so as to take no more than 300 feet on each side of actual lode that is open to appropriation? In making this correction the amended relocation must, of

course, conform to rights that have intervened. Failing to make such amendment, the lode would seem to be open to appropriation without reference to the existing claim. Ignorance of the facts should not defeat its operation. Ignorance of the facts should not defeat its operation to the injury of individuals. If such a location as the Verde is a valid appropriation of the surface over 300 feet from the located lode, it carries with it the right to other lodes that may exist in that surface over 300 feet distant. This is not the intent of the law, and it is reasonably to be presumed that such lodes are subject to appropriation exactly as if the erroneous surface claim did not exist. If a locator measures over 1500 feet in his location the excess is locatable. Therefore, if he locates over 300 feet away from his lode, the excess would seem to be locatable. Expressed in another way, the law will not make an unlawful act committed by ignorance lawful, and thus permit by indirection what it would not permit directly.

Referring again to the diagram, the section of the lode between the points C and D is open to location, and would give to the locator the ledge followed downward between the planes of the lines C—O and D—I. Thus there would be, with only a few feet of apex appropriable, a widening sheet of lode as it extended downward till a maximum length of 1500 feet was reached. The location on the ground to get this extent would have to be staked to conform to the parallelograms k—l—m—n or k—l'—m'—n'.

### Nome District, Alaska.

Special Correspondence of MINING AND SCIENTIFIC PRESS.

The opening of the warm season in Nome is fully a month earlier than in 1899. Actual mining will not begin before July 1st in Koogerock and Port Clarence districts, and about August 1st in Far Haven and Arctic districts. In Council City and Top Rock districts a little earlier, June 20th. Much is expected of these last two districts, as there are many good dumps now out and ready for washing.

Nome district has done fairly well considering the extreme cold winter. There are many good dumps out on the benches and washing will likely commence about June 1st to June 10th. Nome is considered the tropic of northwestern Alaska and no doubt the warmest spot along the coast of the whole Seward peninsula. Yet oranges will not do well here until the sun takes a notion to come north to winter.

There has been quite a good deal of talk and several stampedes to the Arctic district and big pay reported to have been found, but any one at all familiar with the Arctic winter knows how utterly impossible it is to prospect in that country during winter. Just imagine 40° to 50° below zero, wind

blowing 20 to 40 miles an hour, you hanging onto your sled for dear life, your dog team flying around in the air like a string of toy balloons at a circus, and eating frozen fish and frozen grub!

We are told by the few that have mushed in here over the ice this spring that we shall have another big emigration from the States this summer. It is needless to say that there will be many disappointments, as usual. This is not a poor man's country by any means; it requires capital and large experience and plenty of nerve to back it. There are many fortunes to be made here in the next few years by the capitalists who have the experience and nerve.

We are all anxiously waiting the first appearance of that long black streak on the horizon far out in Behring sea that will bring us the first newspapers from the outer world for more than seven months—think of it! Our mail facilities are somewhat of a farce, and it seems to us here that Uncle Sam ought to be able to carry his own mail instead of farming it out to the English contractors to carry it away round by way of Dawson. There are many bags of letter mail lost here during the winter through the ice—sixteen bags at one time and six at another that we know of, and how many more we will likely never know. It is often reported by mushers over the trail that they pass the mail sleds at the road houses where they have laid up for days and days at a time, while thousands of people were waiting for their letters along this Seward peninsula.

When you receive this, please send me your invaluable paper, with a few back numbers, if you have them to spare, that we may catch up a little of the doings of the outside mining world.

Nome, Alaska, May 20.

D. H. JACKSON.

### Character of Certain Contact Deposits.\*

In many schemes of classification and description the term contact deposit has been somewhat loosely applied to all accumulations of useful minerals (other than those of unquestioned sedimentary origin) which are enclosed between two different rocks. As thus used, the term may include deposits of widely differing origin, and, unless qualified, is not in place in a genetic classification. The present paper deals with a special class of contact deposits.

In many geological provinces granular igneous rocks, such as granite, diorite and syenite, have broken through and invaded sedimentary rocks. The molten magma may in part have reached the surface and there solidified with relative rapidity as a lava. The largest masses of it, however, did not reach the surface, but cooled very slowly at considerable depth under great pressure, and eventually consolidated into a rock of granitic texture. Uplifts and extensive erosion may have followed; and at the present day, in many places, thousands of feet of material have been removed, bringing to the surface the intrusive granular rocks and their once deep-seated contacts, with the sedimentaries which they shattered at the time of intrusion. Along these contacts bodies of useful minerals are often found, most commonly where the sedimentary rock is limestone, or, at least, calcareous.

All the world over this group presents certain characteristics, the more essential of which are the following:

**FORM.**—The deposits generally follow the contact, but are extremely irregular in detail and almost always very bunchy. No regular form has been recognized as governing the form of the ore bodies, which are sometimes lenticular masses.

**POSITION.**—The minerals generally occur in the limestone or calcareous rock, immediately on the contact, from which they rarely extend more (usually much less) than 100 feet.

**CONSTITUENT MINERALS.**—The gangue contains garnet, wollastonite, epidote, ilvaite (lievrite), amphibole, pyroxene, zoisite, vesuvianite, quartz and calcite, rarely fluorite and barite. The ore minerals are specularite, magnetite, bornite, chalcocite, pyrite, pyrrhotite, and, more rarely, galena and zincblende. The sulphides may carry some gold and silver—usually more of the latter than of the former—but are rarely rich. Tellurides are unknown. The characteristic feature is the association of the oxides of iron with sulphides, a combination practically unknown in fissure veins, and further the presence of various silicates of lime, magnesia and iron. The deposits are thoroughly metasomatic, having been formed by the replacement of limestone; and the filling of open spaces is almost entirely absent. On account of the great solubility of the limestone, well-developed crystals of the gangue minerals are very common.

**EXCEPTIONS.**—There are some classes of deposits which, though presenting a certain similarity to this type, must be strictly separated from it. Among these are contact deposits between limestone and igneous rocks which carry as metasomatic products (besides galena and zincblende) sericite, dolomite, siderite and quartz, and which, upon close investigation, are usually found to be related to fissures and faults. Further, certain deposits of iron ores, associated with limestone and with garnet-pyroxene-amphibole gangue, but without any apparent close relation to intrusive rocks.

\*From paper "The Character and Genesis of Certain Contact Deposits," by Waldemar Lindgren, in Trans. Am. Inst. Mining Engineers, Richmond meeting, February, 1901.

CALCIUM CARBIDE is believed to have future use as an important element in metallurgical processes. Herr F. von Kugelgen has described a series of his experiments relating to the use of carbide as a reducing agent. Lead, bismuth, chromium, molybdenum, tungsten, manganese, nickel, sodium, potassium, aluminum and cerium were dealt with in his investigations. In most cases he found that the reduction of the oxide or the chloride to the metallic state was possible. The action of the carbide seemed strongest in the case of the chlorides, and generally when the reduction was started sufficient heat was generated by the chemical action to carry the reaction forward without external heating. With the oxides this phenomenon was not noticed. Reductions made of mixtures of chlorides and oxides gave very favorable results. Carbides of the reduced metals were formed only in those cases when the reduction temperature approached that required for carbide formation, and metals more free from carbide impurities may be obtained by the new method of reduction than from the old method of using carbon itself. By using only the amount of carbide called for by chemical theory an excess of calcium in the product was avoided. For blow-pipe reductions in laboratory work it is believed that carbide will prove very useful. The author states that in metallurgical work, under ordinary conditions, 202 kilogrammes (442 pounds) will yield 1000 kilogrammes (2204 pounds) of copper, and other metals in equivalent proportions. Economical reduction of copper ore by

carbide is not feasible at present, but the author believes that for producing nickel and bismuth the method should prove practicable. By using a mixture of the oxide and chloride of two metals it is possible in one operation to obtain an alloy by this means which might otherwise be very difficult to procure.

### The Great Oil Well Near Beaumont, Texas.\*

BY ANTHONY F. LUCAS, BEAUMONT, TEXAS.

**THE HISTORY OF THE WELL.**—Certain geological indications at Gladys's station, 4 miles south of Beaumont, on the Sabine and East Texas railway (a branch of the Southern Pacific) induced me to undertake a thorough test of that locality by means of a well. I had been making reconnaissances for nearly two years in that part of Texas, before deciding upon this supreme effort.

Three previous attempts had been made in the same place: one in 1894 by Messrs. Sharp & Co.; one in 1896 by Mr. J. Looney; and one in 1898 by Messrs. Savage Bros. They had all failed to pass through the immense thickness (500 feet) of quicksand which underlies the surface soil, clay, etc. At first, I employed the system of boring which I had previously used in the Louisiana salt deposits. But I soon found that this method was inadequate, without modification, to deal with the quicksand. According to

gas, rock fragments and oil followed it, at first at the rate of about 250 barrels per hour, rapidly increased to 500, 1000 barrels, etc., until on the third day the discharge (by that time carrying no solid matter and a diminished quantity of gas) was estimated by officials and engineers of the Standard Oil Co., who were naturally the most experienced judges, to be at least 3000 42-gallon barrels of oil per hour, or about 75,000 barrels in twenty-four hours. Probably I had been too conservative in my previous estimates. Fig. 1 is from a photograph taken at this period.

**THE CONTROL OF THE WELL.**—Since this unprecedented outbreak took us by surprise, it was necessary to improvise some means of preventing the total waste of the oil ejected, and at the same time to devise a method for getting the stream under control. To attain the first object, we hastily constructed dams or levees to surround the oil. The first one, about 2.5 feet high, was overflowed in twenty-four hours; a second and a third, embracing larger and larger areas, the latter covering about fifty acres, were likewise overflowed. The clay soil seemed to hold the oil fairly well, but the constant danger of fire was a source of great anxiety, by reason not only of the direct loss of oil, but also of the incidental damage which it might occasion; and, above all, because the ignition of the spouting column itself would make it difficult or impossible to recover and control the well. Even more important, therefore, than the immediate saving of the oil was the shutting of the well. Operations for both purposes were carried on simultaneously.

I was flooded with telegrams, letters and personal applications by the hundred from parties proposing to undertake the closing of the well—for large rewards. Some of them required cash down (ranging from \$30,000 to \$100,000); some would not divulge their proposed methods until paid; others submitted their plans; most of them were cranks, but a few had very sensible ideas. I decided to give the first opportunity to my contractors, Messrs. Hamill Bros., subject to my approval of their plan, which I gave, after suggesting certain modifications.

The apparatus used consisted of a carriage, anchoring an 8-inch gate-valve against upward movement; below the valve a short nipple, with an 8-inch tee attached. The whole apparatus was to be launched against the column of solid oil. This constituted the critical part of the operation. But, since the oil was spouting through a 6-inch pipe, and my main outside casing was 8 inches in diameter, the new 8-inch valve, if successfully placed over and connected with the 8-inch well casing, would permit the stream to go on flowing, with an enlarged diameter (or, in other words, with 1 inch "play" all around it), so that the flow would not be checked by this part of the operation.

The result answered our hopes. Notwithstanding the violent impact of the oil column, the carriage was successfully placed over the well, and the valve, etc., were drawn down with the aid of bolts until the tee could be screwed into the 8-inch casing.

When this had been accomplished the oil was freely flowing through the open 8-inch gate valve. We then inserted into the tee outlet a piece of 6-inch horizontal pipe, with a 6-inch gate at the end; and, after bracing the 8-inch valve as firmly as possible, we gradually closed it, diverting the stream into a horizontal direction, and carrying it out of way. This gave us opportunity to dig around the well, beneath the derrick, and place foundations for an anchorage, which would effectively hold down not only the valves, etc., but also the casings.

After this we packed oakum tightly between the 8-inch and the 6-inch casing; placed a heavy wrought-iron clamp around the former, and by means of strong set-screws secured the 6-inch pipe against any possible upward movement. Finally, by closing the 6-inch gate valve on the horizontal pipe, the flow of oil was entirely cut off. This was done January 19th, at 11.10 A. M., nearly nine days after the well began to flow. The pressure, after shutting down, as determined by a gauge connected with the tee, was 104 pounds per square inch—considerably less than had been inferred from the violence of the stream.

Fig. 2 shows the apparatus as fitted to the well at the moment of the shut-down.

For further protection against fire, a large iron

cylinder was constructed to contain the valves, tee, etc., above ground, with a surrounding packing of sand, so that a conflagration in the oil pools may not be communicated to the well.

There was naturally some doubt whether the well would respond promptly when reopened after a period of complete closure. To test this point, the well was reopened about six weeks after the operation above described. Some gas was discharged at first; but the solid stream of oil was immediately restored.

### A Petroleum District in Colorado and Utah.

**TO THE EDITOR.**—This district was first located in 1888 by cattlemen who discovered the existence of the heavier parts of the oil in the form of gilsonite which exists in veins cutting the formation from the surface down to the oil shale (or their origin), and running cross country, some of them for a distance of 15 miles, and with a thickness of from 2 feet to 30 feet of clear mineral.

It was next discovered in 1889 in the form of oil sand, which is saturated with oil for 100 feet in thickness, rich enough so that two parts of pure sand are mixed with one of surface oil sand in making very tough pavements (there being about 2 miles of this pavement now in use at Vernal City, Utah); and also in the form of oil shale, which is about 600 feet thick. Attention of range riders was drawn to this material by building a campfire at the foot of a ledge on White river, which put the entire ledge in flames. On closer examination the river at that point is found to be carrying considerable oil on its waters, but no estimate can be made as to the amount of seepage without quite extensive preparations. In 1890 oil was found on a ranch near Vernal in sinking a well, and the oil spoiled the water for culinary purposes. In 1892 oil was struck in the center of Vernal City in driving for artesian water at a depth of 800 feet in a shale belt which was not penetrated, the well stopping at a depth of 965 feet.

It was next discovered in January, 1899, by J. Popp, J. C. Hainline and J. Tejillo, in the form of lubricating oil, flowing naturally from the oil sand, and this flow is now called the Dewey Oil Spring. The crude oil as it comes from the spring is being used by all the ranchmen in that vicinity, and some of it of late by the R. G. W. R. R. for lubricating purposes. Late in the season of 1900 the debris was stripped from the formation from which the oil flows, exposing quite a large flow, which was plugged until such time as arrangements can be made to utilize it. At present four companies are interested in this development and all of them contemplate boring this season.

This formation belongs to the Mesozoic period. Where it is exposed on the surface it consists of four strata of oil-bearing rock, two of sand, one of limestone and one conglomerate. These oil yielding strata are from 12 to 100 feet thick, varying in different localities, and are capped with light strata of shale, all of which are overlaid with a 600-foot stratum of oil-bearing shale. The seams and holes in this large belt of shale, where it is exposed on the surface, are filled with the heavier parts of the oil, or gilsonite. This oil can be boiled down to first-class gilsonite, and as it seeps from the sand it is depositing gilsonite in four different places that came to my notice. There are no small anticlinals; the formation dips from exposed parts on the east, west, north and south to the center of a basin about 30 miles across; the formation in the center of this basin is about 2000 feet lower than any part of its outcrop, except where it is cut by the Green river in the Rocky mountains, which is about 1500 feet down, or about 500 feet above center of basin. The oil shale in the basin is covered with about 800 feet of sandstone in which the veins of gilsonite occur. Near the shale these veins grow smaller and on reaching it they disappear entirely, leaving the gilsonite in seams and bunches. For a short distance the veins seem to penetrate the shale for a few feet. The oil, as it seeps from the outcrop of the oil-sand beds leaves some of its base mixed with the sand, forming a very tough, hard cement, which holds the oil from escaping from below.

R. M. POPE.  
Salt Lake City, Utah, June 19.

### Slate as Roofing Material.

The value of a roofing material is determined by a variety of considerations, among which the most important are first cost, durability, appearance, resistance to fire and consequent influence on the cost of insurance, and the expense of maintenance and repairs. Below is a table showing a comparative estimate cost of the leading materials used by the roofing trade. This estimate is based on the "square"—100 square feet of surface—laid on the roof in the vicinity of Philadelphia and New York:

| Material.            | First cost. | Average life in years. | Average cost per year. |
|----------------------|-------------|------------------------|------------------------|
| Slate.....           | \$ 6 00     | 75                     | \$0 086                |
| Tin.....             | 5 50        | 20                     | 275                    |
| Shingles.....        | 4 30        | 12                     | 358                    |
| Corrugated Iron..... | 5 10        | 10                     | 510                    |
| Tin Shingles.....    | 6 70        | 10                     | 670                    |
| Copper.....          | 30 00       | 30                     | 1 000                  |

It will be readily seen that a slate roof is not only

Apparatus Closing the Lucas Well.

adopted the use of large and heavy castings, and pipes of 12, 10, 8, 6 and 4 inches diameter, successively telescoped one into the other. Boring was begun by Messrs. Hamill Bros. of Corsicana, contractors, about the middle of October, 1900; and on January 10, 1901, after many difficulties, a layer of rock containing marine shells was reached, at the depth of 1160 feet. For 150 feet immediately above, the drill had passed through layers of sandstone and concretions of limestone. At this time there was about 600 feet of 4-inch pipe, weighing at least six tons, in the well; and this, together with the next (6-inch) casing above, was filled with water. When the rock was penetrated the well "blew out," lifting the whole of the 4-inch pipe. Mr. Hamill was on the top of the 60-foot derrick when the pipe began to move; but the beginning was so gradual that, warned by the outflow of the water, he had ample time to climb down and retire to a safe distance before the pipe was shot into the air. It went to a height of 300 feet above the derrick, the upper works and heavy tackle of which it carried away; then twisted and bent by the strong wind which was blowing at the time, it broke off with a crash and fell to the ground, fortunately injuring no one. The remaining 4-inch pipe, freed from the weight of the upper portion, followed with greater rapidity, and was shot through the top of the derrick. Simultaneously, the water which filled the well (being used to keep the pipe lining clear by removing upward the debris of drilling) was expelled to a great height; and a column of

\*Trans. Am. Inst. Min. Eng., Richmond meeting, Feb., 1901.

the most durable, but when the original cost and average life are taken into consideration, it is three and a half times cheaper than tin, four and a half times cheaper than shingles, six and a half times cheaper than iron, and twelve times cheaper than copper.—D. McKenna in Cement and Slate.

## Mining and Metallurgical Patents.

Patents Issued June 18, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR ROASTING ORES.—No. 676,417; H. Carmichael, Malden, Mass.

A rotatable combustion chamber, a rotatable retort communicating with combustion chamber, a flexible joint for connecting retort with combustion chamber, means within retort for disseminating ore on passage through retort, means for externally heating retort and combustion chamber, and means for feeding ore successively through combustion chamber and retort.

GOLD SEPARATOR.—No. 676,419; L. L. Carter, Wauseon, Ohio.

A holding frame and a central vertical shaft, a sleeve upon shaft, hubs secured to sleeve provided with radial carrying arms, and screens supported by arms, and a plate in sections controlled by shaft, beneath screens, and means embodying a cam plate and connections for reciprocating plate and means to revolve shaft and sleeve at different rates of speed.

ATTACHMENT FOR CONCENTRATING TABLES.—No. 676,427; W. G. Dodd, San Francisco, Cal.

The combination with a reciprocating concentrating table of a horn attachment secured thereto and carried thereby so as to receive and work middlings discharged therefrom, attachment extending from approximately discharge end of lowermost riffle of table to discharge end of table, discharge end of horn attachment being contracted.

PROCESS OF MAKING CARBIDE OF CALCIUM SIMULTANEOUSLY WITH SILICIDE OF IRON.—No. 676,514; W. Rathenau, Berlin, Germany.

The process of simultaneously producing carbide of calcium and a compound containing silicon, which consists in producing calcium carbide by heat sufficient to cause fusion, from raw material containing carbon calcium and silicon, simultaneously acting upon with an added substance contain-

ing a metal having a greater affinity for silicon than calcium has for silicon, and finally removing silicon compound and carbide of calcium from mass separately.

ORE CONCENTRATOR.—No. 676,534; T. Dynan, Amador City, Cal.

The combination with a suitable table and connections of adjustable rollers 2 arranged under front side of table and journaled in trusses 3, trusses 3 adjustably attached to suitable bed timbers by thumb nuts, rollers 7 arranged beneath rear side of table and journaled in arms 8, arms 8 pivoted to bed timbers and having supporting arms 9 attached thereto, arms 9 each provided with a slot 10 and thumb nut 11, rod 12 attached to arms 8 and to lever 13, and lever 13 provided with its spring stop 14.

MAGNETIC SEPARATOR.—No. 676,618; T. A. Edison, Llewellyn Park, N. J.

The combination with stack B of magnets C, C', C'' of different strengths, perforated floors D, inclined boards a, b, dividing boards c, d, and inclined conduits E provided with perforated plugs e.

APPARATUS FOR OXIDIZING.—No. 676,647; A. N. Dubois, Philadelphia, Pa.

The combination of a circular trackway, a rotary carrier, perforated drum attached to carrier and provided with wheels to traverse trackway, a drive shaft, a countershaft operatively connected with carrier, fixed sprocket wheels of like diameter on drive

shaft, loose sprocket wheels of unequal diameter on countershaft, chains connecting sprocket wheels on two shafts, and a double clutch coacting with loose sprocket wheels.

MAGNETIC SEPARATING APPARATUS.—No. 676,840; T. A. Edison, Llewellyn Park, N. J.

The combination of a magnet having two dished members having polar extremities which are adjacent to each other with a relatively narrow gap between them, non-magnetic rims rigidly carried by said members and arranged parallel with polar extremities, and a belt carried by rims and polar extremities, to which mixed magnetic and non-magnetic materials are fed.

MAGNETIC SEPARATING APPARATUS.—No. 676,841; T. A. Edison, Llewellyn Park, N. J.

The combination with an endless belt supported at both ends and caused at one end to travel concentrically with respect to a magnetic field, linear travel of belt being substantially parallel to zone of maximum magnetic attraction, of means for feeding magnetic and non-magnetic material to belt in an area of line with zone, whereby magnetic particles will be caused to move laterally with respect to non-magnetic particles while latter are subjected to centrifugal force.

PROCESS OF SEPARATING METALLIC FROM ROCKY CONSTITUENTS OF ORES.—No. 676,679; F. E. Elmore, Leeds, England.

The process of separating the metallic from other constituents of ore, which consists in mixing with crushed ore to which sufficient water has been added to make a flowing mixture a substance other than mercury, to which metallic particles only will adhere, and then recovering metallic particles from such substance.

### A New Style Wire Cable.

A number of engineers experienced in the use of elevator wire cables examined the cables of elevator No. 1 of the Bank of Commerce Building at St. Louis, Mo., and found that after five and a half years of continual service the inside strands were in as good condition apparently as when made.

The examination was made by the engineers at the invitation of the A. Leschen & Sons' Rope Co., of St. Louis, Mo., who are the manufacturers in America of the patent flattened strand wire rope, and was made in order to determine whether the oval center of the five strands cut the inside wires. The examination proved that the wires were not even indented by the oval cores of the strands.

This rope is an English invention, and the firm secured the sole right of American manufacture. The flattened strand causes all the outside wires to rest evenly on pulleys or wheels, and to the claim that this would give 150% more service than any round strand wires, the life of the cable examined and its condition would seem to give an affirmative answer.

The engineer of the Bank of Commerce Building, discovering that some of the outside strands were broken, ordered a new cable. The American manufacturers took the occasion to put to examination the claim that the patent strand did not cut the inside wires.

End view of new style cable.

End view of old style cable.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

### KETCHIKAN.

E. W. von Hasselcker reports Dolomi (Johnson's) inlet, Kasaan bay and other mining camps as active. Niblack anchorage particularly is looking up with developments of copper ore.

### NOME.

The results of the winter's work indicate that Nome can be considered a winter camp. Within a circle of 8 miles about the city \$500,000 will be washed out of dumps taken out during the winter. With coal at reasonable prices for thawing, winter work can be prosecuted on a large scale.

From Council City and the Topkuk it is said that the winter dumps will yield \$500,000. The Topkuk beach continues to yield good pay. The bankers and commercial agents of Nome have received over \$100,000 in winter dust and nuggets.

Reports received at Nome during the winter tend to verify the reports of richness in the Bluestone and Kougarak country, and encouraging reports come from the farther northern Arctic districts.

### PORCUPINE.

The miners of Glacier creek are having trouble with the Canadian mounted police over the collecting of duty upon the miners' outfits taken to Glacier creek, which was located under the American mining laws but is now claimed by the Canadians under the *modus vivendi*. All the creeks are working under full head and the first day's cleanup on the Willey & Finley claim was \$800.

### SITKA.

The legal difficulties regarding the Stewart mine at Sitka are now disposed of and the property will be developed.

Directly across the bay from the Stewart mine a number of claims have been located. Preparations are being made to put in an air compressor and run a working tunnel which will cut the ledge at great depth. The Chicago & Sitka G. M. Co. controls these claims.

The Lake Mountain, embracing four claims and a 5-stamp mill, is controlled by Providence, R. I., people. It is located about 5 miles from salt water.

The Lucky Chance is 2½ miles from Silver bay. Its ore goes \$30 per ton. Two tunnels are being opened and a 7-stamp mill will be erected near tide water this summer. A tramway will connect the mine with the mill.

## ARIZONA.

### COCHISE COUNTY.

The Gleason Co. have the main shaft down 200 feet, opening a body of sulphides 28 feet wide. Shipments from the mine average 1000 tons per month. The properties are bonded to Eastern parties at \$1,000,000 for one year.

### GRAHAM COUNTY.

Two gas engines have been put in the pumping plant of the Arizona Copper Co. to pump water from Clifton to the new concentrator.

## CALIFORNIA.

### AMADOR COUNTY.

E. P. Raun, the owner of the Delray mine at Middle Bar, is running a tunnel prospecting.

The Mitchell mill at Pine Grove is shut down while development work and repairing are being done. The shaft is down 200 feet.

At the Amador Phoenix mine near Clinton the 10-stamp mill is being put up and it is expected to have it in operation in two months.

### CALAVERAS COUNTY.

Manager W. C. Ralston of the Melones Co., Robinsons Ferry, states that the 120-stamp mill is to be completed this summer. As to whether water, electricity or steam will be used for power has not been determined as yet. The upraise from the level of the old Carolina tunnel to the old works above on the Carson Flat side of Carson hill has been finished. The mine is now considered in shape to steadily supply 120 stamps with ore.

The Demarest mine is closed down for an indefinite period. The last run of thirty days yielded \$2900.

### NEVADA COUNTY.

It is reported that the Wright & Bailey mine near Sweetland is soon to be developed. F. Wright of North San Juan says that a San Francisco company is interested. It is said that a smelter will be erected.

The Lecompton mine recently shipped ten tons of ore to the smelter, which re-

turned \$600 to the ton. Dunlap & Thomas are working the mine.

## PLACER COUNTY.

At the Nisson quartz mine, near Colfax, the new owners are installing a Huntington mill. The ledge is a large vein of soft rock heretofore worked by sluicing.

At the Mayflower mine at Forest Hill J. E. Nihill is Supt. Work has been done to tap the upper Paragon channel.

At the Sacramento mine, near Forest Hill, an upraise of 153 feet was made from the main tunnel some 1200 feet in. Very rich gravel was encountered and preparations are being made to develop it.

At Butcher Ranch H. McKinstry and H. Skinner are prospecting the E. B. Gilbert claim.

Sample & Son of Yankee Jims have commenced to clean up at the Cambridge tailing mine.—J. A. Holmes is taking out good gravel at the Little Dipper mine.

—Chinese are working the Small Hope gravel mine on a lease.—A. McCulloch has a lease on the Enos, Federer & Cranage mine.

At the Hidden Treasure at Centerville some time since an east and west channel was cut crossing and cutting off the big white gravel channel at a point about 9000 feet in. The main tunnel extended through cement 200 feet, again entered the white gravel. A shaft was sunk in the 200-foot channel 18 feet, when 3 feet of blue gravel and bedrock was reached. The main tunnel has been extended 550 feet on the white channel beyond the point where it was cut off. A gangway run west 250 feet cut the rim. The gangway east 300 feet is still in good gravel. The present operations are in the four breasts in gangways Nos. 9 and 10 at a point about 8000 feet in, with about a year's work in sight. No. 5 gangway 7000 feet in on the main tunnel has been run west across the channel 1100 feet; then in a northwesterly direction 440 feet to work a body of gravel on that side of the channel which is lower than the main tunnel. The blue channel is being worked through a slope. This channel has been opened north 1000 feet and south 300 feet. An average of 400 cars of pay gravel are taken from the white channel daily and 100 from the blue channel. The Hidden Treasure Gravel M. Co. employs 170 men. H. T. Power is president, F. K. Develley secretary and C. D. Akers Supt.

A ditch is under construction from a reservoir from the South Yuba Water Co. to the Gold Blossom mine at Ophir, a distance of 6400 feet. Pipe has been contracted for to develop the water power at the mine under 440 feet head. F. Hartley has charge of the construction.

## PLUMAS COUNTY.

F. C. Dickenson says of the property of the Last Chance M. & M. Co., in eastern Plumas county, that it has a 7-foot ledge containing copper, silver and gold, with ore assaying from \$50 to \$103 per ton. The company is a Reno, Nev., organization, including J. Sparks, D. C. Wheeler, A. E. Murdock, F. Fry and others.

## SAN DIEGO COUNTY.

It is reported that the Golden Cross mines at Hedges, near Yuma, have been sold to New York parties for \$2,000,000.

## SHASTA COUNTY.

G. H. Barber has a contract to run a lower drift on the Evening Star. Sinking is in progress to connect the lower drift with the surface.

W. D. Watson and C. Watson are working the Connor mines on Salt creek under a bond. The shaft is now down 60 feet. From the bottom of it, drifting north and south, the ore body shows an 18-inch vein. The ore, which they will begin shipping immediately, will go to the smelter at Keswick. It is expected to return them about \$3000 as a result of their four months' work.

S. L. Jones, A. C. Hamilton and H. M. Gorman have bought the Kline & Wall mining claims at DeLamar. The claims lie about a mile from the Bully Hill mine. They were located only a few months ago.

## SIERRA COUNTY.

The Twin Eagles mine, midway between Downieville and Sierra City, which was operated by Poorman & Hastings, has been abandoned, the rock being too low grade to work at a profit, and the machinery has been sold.

## SISKIYOU COUNTY.

A rich vein of ore has been struck in the tunnel of the Highland mine on Russian creek, on the road from Etna to Sawyer's Bar. W. C. Music is the owner. The ledge runs from 2 to 28 inches in width.

Work has been started up again in the Schroeder mine at Deadwood. It is reported that the mine has been sold by the Canadian company who bought it a year ago.

## TUOLUMNE COUNTY.

The Mt. Jefferson will be started up by Eastern capitalists soon. Supt. J. Melhan

proposes to sink the shaft to a greater depth. A hoist of larger capacity is being erected.

The mill on the Eureka Con., or Dead Horse, mine will not be operated pending sinking the shaft from the 1550 level.

A 2-stamp mill is being erected in Hunter Canyon to work ore from the Blue Bird, owned by J. Gloster.

At the Hunter mine another hundred feet is to be sunk with increased power facilities from the better development of the water power.

The Jamestown G. M. & M. Co., capital \$300,000, has been incorporated to operate the Badger, Annie Dwyer and Calker claims, on the west belt of the mother lode near Jamestown. R. S. Enslow is president and J. W. Byrd of San Francisco secretary of the company. The development on the ground consists of a shaft 250 feet deep and levels run from it. The ore is estimated to average about \$14 a ton in the shoot.

## COLORADO.

The matte smelter which Dr. F. R. Carpenter is now erecting at Golden, it is said, will have a refinery owing to no satisfactory arrangements for refining being made with the existing refineries. Work on the buildings has been commenced. Dr. Carpenter says that the addition to the plant will make the smelter absolutely independent, and in that respect of considerable importance, though it adds but little, comparatively, to the cost of the plant. The smelter will be blown in between the 1st and 15th of July. Ore is already delivered and there will be a good supply on hand when operations commence. Dr. Carpenter has bonded the Stephens group in Clear Creek to insure the plant an ample supply of ore.

The scheme for the erection in Denver of a central refinery for the independent smelters will be revived as soon as the matte plants have completed the enlargements now in progress or projected. With the addition to the Florence plant that smelter will have a capacity of 800 tons per day. The Buena Vista's capacity will be 300 tons, the Golden smelter 300 tons, the Ouray smelter 100 tons, and the Kendrick & Gelder smelter at Silverton 100 tons. Investigations now in progress may result in the construction of a Carpenter matte smelter for the low-grade ores of Boulder county. All of the smelters will therefore have a capacity for treating 1600 tons of ore per day, and the proposition will be submitted to jointly establish a refinery.

The consolidation of Colorado ore reduction works milling Cripple Creek ores has been made as the American Red. & Ref. Co., capital \$10,000,000. Tutt, Penrose & MacNeill, of Colorado Springs, are said to control the combination. C. M. MacNeill, it is said, will be general manager. Only the four largest plants are included, the Union G. Ext. Co. and the Metallic Ext. Co. at Florence and the Standard M. & S. Co. at Colorado City. The combined capacity is 1500 tons daily, or 45,000 tons per month. The combine is expected to absolutely control low and medium grade Cripple Creek ores marketed. It is reported that all ore producers having contracts with the old companies have been notified that after July 1st new contracts will be on the basis of rates from \$8 to \$12 a ton, averaging \$1 a ton advance, being precisely the average advance made in smelting charges since the consolidation.

## BOULDER COUNTY.

The new machinery for the Colorado & Northern G. M. Co. will be installed for the extension of the tunnel, now 2065 feet in. A strike has been made at the 1330-foot point, which shows considerable silver, galena and copper.

The Lucky Star mine at Boulder has paid for sinking its shaft 300 feet from the returns from ore, and in addition paid dividends to the owners.

The Enterprise, at Eldora, leased and bonded to Mrs. E. J. H. Richardson of Denver, is doing development work. C. Shahan is superintendent. It is equipped with a steam hoist, and the shaft is down 360 feet.

## CHAFFEE COUNTY.

D. A. Freman, manager of the Sedalia mine, and the company's engineers are preparing plans for the construction of a milling plant at Sedalia. The company owns the Canon City smelting plant, and heretofore all the ore shipped has been sent to that plant. The details of the new plant have not yet been determined upon finally.

## CLEAR CREEK COUNTY.

The Omar G. M. & T. Co. has been organized by J. L. Lindsay, H. A. Riedel and G. L. Torrey, capital \$200,000, to operate 130 acres of ground, including the Holland tunnel and tunnel site in Hamlin gulch, near Idaho Springs.

The Idaho Springs G. F. Co. some time since bought the Torpedo and Sky Rocket

mines, near Idaho Springs. W. S. Marshall is manager.

## GILPIN COUNTY.

The Seneca G. M. & M. Co. of Buffalo, N. Y., has resumed work upon the Brooklyn mine, in Lake district, near Black Hawk.

## LAKE COUNTY.

The mining companies operating where streets and alleys are owned by the city and a number of mining men have made bids for leases on the ores beneath the streets and alleys. The Maple Street M. Co., sinking in virgin territory, feel that they will open up the extension of the Leadville basin ore shoots. Their shaft is down over 500 feet, and they are now pushing diamond drill work before sinking deeper. They are now endeavoring to secure the rights on royalties to the mineral under the streets and alleys in the neighborhood of the shaft, and offer to pay royalties on net smelter returns as follows: \$10 or less, 10%; \$10 to \$20, 15%; over \$20, 20%.

The development of virgin territory is to be begun by the Holland M. Co., owners of forty-nine acres on Fryer hill. The property was located and patented by J. Healey and A. G. Verhofstead, miners, who leased for five years from their co-owners, Messrs. Kountze, Sheedy and Schlessinger of Denver, and are arranging to develop the property.

## SAN JUAN COUNTY.

Ore returning 2.84 ounces gold and 30 ounces silver has been found on Galena mountain, 12,000 feet high, and about 3 miles from Howardsville, by C. A. Marshall.

## TELLER COUNTY.

A consolidation, including the Dante, Tenderfoot Hill Con., Robert Burns, Fauntleroy, Golden Terry and Ramona properties, 134 acres on Battle mountain, Raven hill and Tenderfoot hill, is being negotiated, and, it is expected, will be formally effected by the present owners on July 12. It is proposed to incorporate with \$3,000,000 capital stock, of which \$2,500,000 will be allotted in payment of the property.

The Maggie, on Bull hill, idle for a year, is likely to have work resumed by lessees. The shaft is down about 400 feet, and has on it a good plant of machinery.

Deadwood No. 2, owned by the New Zealand Co., Bull hill, Cripple Creek, is making a good production. The pay streak is from 1 to 3 feet wide. The last shipment ran \$22 per ton. Assays taken from an upraise on 18 inches of quartz ran from \$200 to \$400 per ton.

A Cripple Creek Co. has arranged for the extensive development of Mineral hill. They propose to organize a leasing company and start a system of development that will reach all of the veins known to exist in the hill, and bring the output nearer into Cripple Creek than possible by shaft development.

The Rittenhouse property, 1½ acres on Gold hill, near producing properties, and 50 acres in other parts of Cripple Creek, have been bought by A. O. Crozier of Grand Rapids, Mich., and his associates for, it is stated, \$151,000. The Rittenhouse has a shaft down 300 feet, with considerable drifting, and has produced some pay ore. The mine has been operated by the buyers for the past three months.

The Golden Cycle Co., at Cripple Creek, on the 18th inst. lost its shaft house and ore house by fire, and two months will be required to put the mine in a condition to resume production. The fire went down the shaft for some distance, destroying the timbering. The rebuilding of the surface improvements has been commenced, and it is said a \$25,000 plant will be built. The machinery, consisting of the hoist and boiler, remained intact, and can be used again.

## IDAHO.

### IDAHO COUNTY.

W. H. Plummer of Spokane, Wash., president of the Dixie Queen G. M. Co., has bought from S. Dillinger the North Star and South Star claims at Dixie.

The Midas G. M. Co., having explored the Ajax property, is waiting on the construction of a mill, which will be installed as soon as possible.

Two new stamp mills are going into the Buffalo Hump country, is stated by T. Parks, Supt. for the Clarence Ray-Buffalo Hump Co. One of the new mills has been bought by F. Brown for the Jumbo. It is of the latest pattern of a 2-stamp battery and can mill ten tons of ore a day. It is put on chiefly to prospect the property. More machinery will be added later. There is 6 feet of ore that assays \$25 per ton. Development has been by a tunnel 350 feet long that enters the lode 250 feet down.

The Wise Boy people, at Buffalo Hump, are getting a mill. Judge Moore, one of the owners, is in San Francisco to buy the machinery of a 5-stamp plant, and it should be on the ground in August. The

Wise Boy has a ledge 18 feet wide, with a 3-foot pay shoot in it that runs very high.

A discovery is reported from the great bend of the Snake river near Ontario. It seems that a shaft has been sunk 85 feet, passing through 4 feet of false bedrock. Beneath is found a conglomerate, as it is described, that carries gold in large quantities. According to the report, the shaft has passed down 25 feet in this material, which becomes richer with depth. It is said the gravel carries \$27 per cubic yard. People in the vicinity are staking the ground off rapidly.

#### KOOTENAI COUNTY.

R. Neill, operating discovery claim in Santa, has been using sluice boxes, taking out about \$15 a day to the man.—W. Partridge of Rockford, owner of the Yellow Boy placer claim, is sinking for bedrock.—J. W. Monford is putting in sluices on Tyson creek.—The McClellan Bros. are opening the Pheasant placer claim, on the north side of the creek, and are taking out some fine gold. About twenty placer claims are being worked at present. Some strong high-grade ledges have been discovered. Active development work is now in progress on the following claims: Blue Bird, Morning Star, Asurite, Washington, Spokane, Ironclad, Rabbit's Foot, Pheasant and Little Mac.—Mathews, Shroder and Desgranges are sinking a shaft on the Blue Bird. The ledge is 8 feet wide at the surface and assays \$3 gold, \$10 silver and 3% copper.—About seventy-five miners attended the meeting at Tyson on the 16th inst., and petitions asking for a postoffice, a daily mail service and a county road were signed.—H. S. Richey has erected a log building which is to serve as store and hotel.

#### MONTANA.

##### CHOTEAU COUNTY.

A strike is reported from the Landusky mining district by O. P. Sorbman and G. Putman, who have located an immense lead about 2 miles long and 200 feet wide. The assays show all the way from \$8 to \$18.

##### DEER LODGE COUNTY.

In the Snowshoe district, near Elliston, a ledge of copper pyrite has been opened in the Amelia claim by Smith & Castimore.—C. W. Wakeman has a fine showing of copper ore in the Copper Wire claim.—Rawlings & Co. are shipping carbonate copper ore from the First Chance claim, which they have bonded from A. McDonald.—Southmayd & Matchette are sinking a shaft on the Sure Thing and have struck a shoot of ore carrying high values in silver.

##### FERGUS COUNTY.

The New Year G. M. Co. at New Year has contracted for the construction of a Bleichert wire rope tramway connecting the mines and mill. The distance is 4900 feet, difference of level 564 feet. The capacity will be twenty-five tons per hour. The management estimate that the cost of ore tramming will not exceed 7 cents per ton, the cost by wagon transportation heretofore having been 60 cents per ton.

High-grade ore is shipped from the Spotted Horse mine at Maiden to the East Helena smelter. The value of some of the high-grade ore being shipped is more than \$750 per ton, and the average of the first 30-ton shipment it is claimed will exceed \$300 per ton. The 20-stamp mill at the mine is being prepared to work the low-grade ores, which average about \$12 per ton.

Lewistown, Mont., June 17.

##### LEWIS AND CLARKE COUNTY.

The erection of two new blast furnaces at its East Helena plant is contemplated by the American S. & R. Co., to work the increased quantity of ore offering for treatment. The erection of an entirely new blast furnace building with a capacity for six furnaces is said to be dependent only on the closing of new ore contracts, which would make the extension necessary. C. W. Whitley, the manager, says the present capacity is 800 tons a day, when all four furnaces are in blast, and the two new furnaces would increase it to 1200 tons a day.

R. A. Panches has made a rich copper strike in his iron mine near Butler. He says: "I struck copper ore a month ago, and it has been getting better ever since. I am now down 100 feet on the incline shaft. At a depth of 60 feet I struck the first copper. The mine has been worked as an iron mine and I have been shipping the ore for flux in the smelter. I have three claims and am working the Red Bird, employing three men and shipping three cars a week."

L. C. Alexander of Kansas City has bonded the Josephine lode and the interests in the Marshal Ney and Gus Nelson claims in the Rimini district, owned by the First National Bank when it became insolvent.

#### NEVADA.

##### ESMERALDA COUNTY.

The Mt. Diablo tailings at Soda Springs have been sold to California parties, who are now putting up a plant to work them.

J. F. White and associates, who bought the O'Hale mines from Senator Wasson, will move the State Line mill to the mine near Silver Peak.

##### HUMBOLDT COUNTY.

The Nevada M. & S. Co. has purchased the Hadley & Campbell group of mines, consisting of the Gold Bug, Fair View, Badger, Unlucky Dog and Carbonate claims, in Buena Vista mining district, near the town of Unionville in this county. Work will be commenced on the property at once. J. C. Hadley will be general manager of the company and J. P. Campbell Supt. of its mines.

Unionville, in the foothills of the Buena Vista mountains, 20 miles south of the Central Pacific R. R., is one of the oldest mining camps in Nevada, having been located in 1860. At one time there were four quartz mills working ore taken from the mines of the district; they were all wet-crushing mills, working to save free-milling values. The ore carrying most of its values in sulphides, a very small percentage of the content was saved. The mines for twenty years have been operated with this free-milling method, but have been unprofitable, particularly since silver decreased in value. There is, however, an enormous quantity of ore that, with modern treatment and machinery, will pay well.

In the vicinity of Unionville, Dungen district has gold mines which have been worked in a small way for many years. There are large bodies of low-grade gold and lead ores here which could be made to pay with concentrating machinery, using the cheap power of several streams.

Star City district has antimony deposits, as well as gold and silver, all in large bodies, with water power that can be utilized.

Cottonwood canyon is another near-by district, rich in ores that can now be handled cheaply. There has been much development work done here on lead deposits. J. C. H.

Unionville, June 22.

##### WASHOE COUNTY.

The company formerly the U. M. Slater Co., but now composed of Gen. Turritin, A. Fleisschaker, Senator Flanigan, J. Sullivan, A. Scheline, A. G. Fletcher and A. E. Osborn, have let to M. Shields of Placer county, Cal., the contract to run a tunnel 1000 feet on the First Chance and Lake claims, Wedekind district.

The Empire Copper Co. at Pyramid has started tunnel work. M. D. Young, one of the bonders, is Supt.

The Ballarat M. Co. of Nevada has been incorporated by S. W. Porteous, A. W. Plummer, W. H. Merklinger, J. Merklinger, G. Merklinger, F. M. Baughton, S. Armanco, C. R. McBurney and J. E. Stanaway of Reno, to develop a claim located near Reno. A. W. Plummer was elected secretary and treasurer.

##### WHITE PINE COUNTY.

Seventeen mining claims in the vicinity of the Ely claims, near White Pine, have been optioned by the wife of President McKinley and her sister to an Eastern syndicate. Prospectors on the Ely claim recently uncovered ore which assayed as high as \$140, but a survey showed the deposit to be on the claims and work was stopped. The survey showed that the Los Angeles claim also encroached, and that the 65-foot shaft which that company had been working a number of years was on the Saxton claim.

#### NEW MEXICO.

##### GRANT COUNTY.

S. M. Rohr, president of the Pacific Union M. and S. Co., expects soon to begin the erection of a custom smelting plant at Lordsburg, so as to blow in the first stack in September. Later other stacks and a reverberatory furnace will be added. The company have already contracted for 600 tons of ore for daily delivery from Shakspeare and Stein's Pass.

##### SOCORRO COUNTY.

The directors of the Silver Bar C. M. Co., operating in Cooney district, has declared its first dividend—6 cents a share, \$5400 in all—the issued capital stock being 90,000 shares. This company is a close corporation and is owned by C. H. White, D. P. Sill, H. C. McCreery and two others, all of Denver, Colo. H. C. McCreery, superintendent, states that last month the mine earned an 8-cent dividend over and above all expenses out of a total production of only \$12,000. The average monthly output is \$15,000. The deepest workings are now about 400 feet.

#### OREGON.

##### GRANT COUNTY.

The Alamo Co., near Granite, J. R. Cassin of Spokane, Wash., Supt., is push-

ing work in its long tunnel. About 300 feet of work is required to make connection with old workings. The company is planning to erect a stamp mill.

##### JACKSON COUNTY.

It is stated that the Treasure mine, at Blue River, bonded by J. Downer to Fisher & Chapman, and rebonded by them to C. H. Park, has been bought by the latter. Mr. Park is blocking out ore in the mine, and it is expected a mill will be built next season.

The Uncle Sam M. Co. has let the contract for a 5-stamp quartz mill and saw mill, to be erected immediately near Gold Hill.

The Lone Star placer mine on Pleasant creek, C. E. Wickstrom, Jackson, owner, cleared up for the winter's run \$2400.

##### JOSEPHINE COUNTY.

The Granite Hill Con. mines, on Louse Creek, near Grants Pass, have been bonded to J. L. Wiggings of Minneapolis, for \$75,000, by Booth, Mangun et al. The first payment is due September 1. This is a placer and quartz mine combined, the placer having been worked for several years, while the quartz mine has a 5-stamp mill on it.

Dr. C. R. Ray, of Gold Hill, has bonded from G. Bolt the Sugar Pine quartz mine in Galice Creek district, and has men at work doing development work.

##### LAKE COUNTY.

C. MacK. Lane is said to have filed 720 placer claims, taking in all of Albert and Summer lakes, near Paisley, for the borax contained in the waters—or the borax supposed to be in the deposits under the lake waters.

##### MALHEUR COUNTY.

Prospectors and mining men have been rushing from Baker City to the new gold find on Snake river, just above Ontario. The gravel is 40 to 80 feet deep to bedrock and the gold, which is coarse, it is claimed, runs from \$8 to \$27 to the cubic yard. Snake river gold is usually very fine and difficult to save, and is generally found in sand in the river bars. The new strike is in gravel, and the rich ground is said to be 4 miles wide and 10 miles or more long. It is believed that not half who have started for the new gold field will be able to secure locations, so great has been the rush of prospectors there in the past few days.

##### UNION COUNTY.

The McDougal group of thirty claims at Homestead, on Snake river, a few miles above Ballard's landing, is being developed by W. B. McDougal. The zone of mineral covered by these claims runs northeast and southwest, and lies between two parallel lenses of lime, about 2 miles apart. The ore within the zone is not in regular veins, but exists more in the form of deposits. The country rock between the lime lenses is a porphyry, with occasional lime horses. The ores comprise copper glance, bornite and red oxide of copper. Mr. McDougal states that he will be able to make some shipments soon that will run 40% to 50% copper. His shipments will be by wagon to Baker City, 80 miles distant. The mine is being opened by tunnels.

Homestead, June 24.

#### SOUTH DAKOTA.

##### PENNINGTON COUNTY.

The Saginaw M. Co. of Yale, Mich., has struck a rich vein of free-milling ore near Custer. It is about 4 feet wide and assays about \$70 per ton gold. It is to be developed along with other veins in the mine and a mill and cyanide plant will be installed this season. The company has bonded additional ground adjoining.

#### UTAH.

The United States assay office at Salt Lake City reports that the mineral production of Utah for the year 1900 exceeded in value that of 1899 by a large per cent, the principal increases being in the silver and copper produced. The totals for 1900 show: Gold, \$4,035,610; increase, \$529,028. Silver, \$12,129,854; increase, \$2,842,604. Copper, \$2,324,076; increase, \$782,042. Lead, \$4,260,095; increase, \$339,577. Totals, \$22,759,635; increase, \$4,493,251.

##### BEAVER COUNTY.

The Blue Jay mine in Washington district has been bonded to F. Sugden and L. H. Gray of Salt Lake City for two years at \$50,000. Operations were suspended last fall after the company had expended \$30,000 in sinking a new working shaft. A drift had been driven within a few feet of a known ore body. The lessees will develop this ore.

##### BOX ELDER COUNTY.

The Ione M. & M. Co. has been incorporated, capital \$30,000. J. B. Toronto is president and R. W. Madsen of Salt Lake City secretary and treasurer. The company owns the Ione and twelve other mining claims in the Park Valley mining district.

#### JUAB COUNTY.

The Mammoth produces about 5500 tons of ore per month, milling 4000 tons of this and shipping the balance to the smelter. The mill concentrates run about 25% iron, 1% sulphur, 3% lead, 3½% copper, twenty-eight ounces silver and small values in gold. The Mammoth is the only concentrating mill now operating in Tintic district. Its process comprises stamps, Frue vanners, pans and settlers. This is the deepest mine in Utah, the lowest level being 2100 feet depth, where they are into sulphides. It is expected these workings may reach water level at no great additional depth.

The Emerald, under the management of M. L. Oglesby, is still pushing development. A shoot of ore was recently encountered on the sixth level, the mineral being copper and iron. A level is being run from the 700-foot station to cut under this ore body.

The Lower Mammoth, adjoining the Ajax on the west, is opened through a 700-foot tunnel, near the breast of which a large station is cut where an air compressor and hoisting plant are in operation. At this point a vertical shaft sinks 900 feet, cutting into a large ore body at 700 feet depth. The ore shoot runs north and south, dipping westward. It is believed the same vein outcrops on the Ajax farther northward. The ore is a well oxidized copper carbonate, with good values in copper and silver. On the 900-foot level the work shows the same extent of ore. On this level a stope 100 feet high has been carried 140 feet longitudinally with the shoot and the face of ore still looks the same. Much of the silver is in chloride form. The property ships about one car of ore per day. The compressor is operated by electric power, the hoist being operated by compressed air. Simon Bamburger is manager.

The Tesora is on Treasure hill, at the southern end of Tintic district. This locality is in the porphyry formation. The Tesora is perhaps a mile south of the contact that separates the lime formation of the Tintic range from the porphyry section referred to. While all the mines in the lime formation are destitute of water, even at 2000 feet depth, the workings on Treasure hill, in the porphyry belt, have run into strong water courses at 300 to 400 feet depth. The Tesora struck water level at 400 feet, from which point 300 gallons per minute are being pumped. Here also is a character of ore which differs some from the ores of the lime belt. Tesora ores from the 300 and 400-foot levels are in iron and copper sulphide, with no lead, and the shipping grades run as an average about 35% iron, 9% copper, twelve ounces silver and 80 cents gold to the ton, making an ore which will concentrate well. On the upper levels, as shown by the workings of some years ago, the ores were oxidized; but the continuous vein now exposed on the 300 and 400, trending from northeast to southwest, carries solid sulphide ore, about two-thirds of which may be classed as mill ore and one-third shipping ore. It runs only 5% or 6% silica, hence it will make a clean concentrate. On the 300-foot level are about 1200 feet of work on the vein, with numerous stopes started. On the 400 level about the same amount of work has been done, with practically all the ground between the two levels capable of being stoped to advantage. Thus, the vein is opened up a distance of 1000 feet on two levels, the ore appearing to be continuous throughout. About twenty tons per day of the high grades are being shipped. A concentrating mill, equipped with crushers, rolls, screens, jigs and tables, is being completed. It will be started up within thirty days. The company owning the Tesora is managed by Col. Heffron of the Bingham C. & G. Co., James Creighton being Supt. in charge. WASCOTT.

Silver City, May 23.

The Mammoth M. Co. has given C. Butters an option for five months on the 250,000 tons of tailings of the Mammoth mills, the price in case of the taking up of the option to be 50 cents a ton and the time five years. The tailings contain an average of \$5 a ton. Tests are now to be made to determine the probable profit of treatment.

##### SUMMIT COUNTY.

The Summit M. Co., whose mines are 20 miles east of Park City, has decided to begin work. The action was taken by the directors at a meeting held at Coalville. J. H. Stallings and J. T. Hodson, members of the board, report an excellent showing of ore at the surface, the galena yielding as much as 60% lead, twenty to thirty-five ounces silver and \$4 gold per ton. It is the intention to sink upon the lead at once.

The Western Monitor M. Co. has incorporated, capital \$30,000, to operate the Great Western 1 to 5, the Sofia, Lady Louise and Terrible Swede mining claims at Park City. Considerable work has been done on the claims and men will again be put to work on the ground. A.

J. Fern is president and A. H. Steele secretary.

## SALT LAKE COUNTY.

W. S. Earls has sold for \$12,000 to the Tintic M. & Dev. Co. the Great Western mining claim at Bingham.

The St. Joe M. Co. has bought seventy-fourths interest in the Ublig Nos. 1 and 2, the St. Joe No. 1 and the Ida mining claims at Bingham for \$244 40.

A sheriff's deed has transferred a half interest in the Monaco, Navajo and Silver Bell mining claims at Bingham to C. W. Heidel for \$960.43.

W. F. Snyder has sold to S. M. Levy for \$2000 the Adair, Thayer, Independence, Palmetto and Alhambra mining claims at Bingham, and S. M. Levy conveyed the same property to the Sampson M. Co.

## WASHINGTON.

## STEVENS COUNTY.

A compressor has been placed on the Acome mine, near Kettle Falls, by the Northwest M. Co. The company expects to run its 1300-foot tunnel before the end of the year. The daily advance is 6 feet. W. F. Stevens is Supt.

## OKANOGAN COUNTY.

D. Hart has completed the organization in Oakland, Cal., of the Golden Ledge M. & M. Co. to operate a group lying west and adjoining the Triune. The intention of the company is to sink a 500-foot shaft. The contract for the first 50 feet has already been let, S. A. DeMerchant securing it. Mr. Hart is president and general manager of the company.

## WYOMING.

## UINTAH COUNTY.

The Native Copper group at Alta has been sold to Salt Lake people by M. J. O'Neill and J. Bettles for \$10,000. The ground has been opened up by a shaft and tunnel, showing copper ore.

## FOREIGN.

## BRITISH COLUMBIA.

The Miner-Graves Syndicate have secured the Virginia and the Cromwell mines, in the Trout Lake mining district, and it is said will expend \$10,000 in development work.

The Triune, in the Lardeau, is shortly to start work again.

The Metropolitan and Sunset, a couple of North Fork properties, will be worked extensively this season.

The Lorne mine in the Lillooet district has closed down. The reason given is that the ore in the lower levels has turned base and cannot be treated with the present milling plant.

J. McK. Anderson, Western manager of the Gold Hill Exploration Co. of Toronto, is in Lardo and intends putting men on the Copper Queen group and other properties owned by the company.

The International and Happy Medium claims, situated in Nelson division, on Twelve Mile creek, has been bonded by R. E. Fishburn at \$12,000. A contract to run a tunnel has been let.

The Silver King mine of Nelson is sinking a shaft 1000 feet and expect to have it completed with the next thirty days. When completed it will be the deepest shaft in British Columbia.

The Poorman mine, Nelson, has closed down temporarily, owing to an accident to the air compressor.

Nelson, June 18.

The Lawry Syndicate has started development on the Nicola claim, in the Nicola district, bonded to the syndicate at \$10,000.

## KLONDIKE.

Some people have come into Dawson from Stewart river. They say the prospectors who are working there seem to be very well satisfied with their prospects. They also report that there is plenty of good quartz and think the district will develop more in lode mining than in placer mining. W. C. Young is down from Clear creek, where he is mining recorder. He reports Clear creek a summer proposition entirely, and says this season will determine its value as a placer producer. He says that a couple of men are taking out high wages on a Stewart river bar below the mouth of Clear creek.

A rich gold find has been made on No. 7 above discovery on New Dominion creek. The discovery was made on comparatively old claims, but on lower bedrock. Pans of gold taken out ran, it is said, as high as \$32, and nuggets worth \$70 and \$80 each were picked up.

## MEXICO.

The Candelaria M. Co. of Denver, Colo., has been advised by its Supt. at Parral that the railroad has promised to run a spur to the mines. The company will now go ahead with its construction of a 50-ton cyanide mill. The company has a 12-ton mill on the ground and it is proposed to increase the capacity to fifty tons.

## Personal.

E. MANSFIELD of London, Eng., is in Nelson, B. C.

CHARLES ROBINS has been appointed foreman of the Globe group, Shasta Co., Cal.

GEORGE C. ROBERTS of Washington, D. C., Director of the Mint, is in San Francisco.

A. J. BLACKBURN of Grass Valley, Cal., has been elected Supt. of the Tule Belle mine at that place.

H. LEE HUSTON, formerly assayer for the Goleconda mine, Sumpter, Ore., has gone to Rogers, N. M.

J. O. JONES, after two years at Urga, Mongolia, superintending mines, has returned to San Francisco.

CARL HAND of Salt Lake City, Utah, has gone to the island of Celebes to examine some copper mines.

A. D. CULLOM and E. J. ANDREWS of the Castle Peak mines, Mono county, Cal., have gone to London on a visit.

ROBERT J. CORY, the western manager of the Allis-Chalmers Co., has returned to Denver, Colo., from Salt Lake City, Utah.

JAMES GILES, of Butte City, Mont., has been appointed foreman of the Winthrop mines, Copper City, Shasta Co., Cal.

C. T. DURELL has just returned to Denver having been in southern Arizona examining copper properties for the past three weeks.

HENRY BRATNOBER of London is at Ketchikan in southern Alaska examining the Mount Andrew copper mines on Prince of Wales island.

PATRICK CLARK and MAJOR B. C. KINGBURY of Spokane, Wash., are at Ketchikan examining mining properties on the Prince of Wales island.

T. C. ARCHER, M. E., formerly Supt. of the mines at Iron Mountain, Shasta county, is at present in charge of the Zeekendorf mines in southern Arizona.

E. P. JENNINGS has returned to Salt Lake City, Utah, from an examination of copper ore deposits on Princess Royal island, on the British Columbia coast, a short distance south of the Alaskan boundary.

W. H. LA PERLE of the Trent Engineering & Machinery Co., has returned to Salt Lake City, Utah, from De Lamar, Shasta county, Cal., where he has been superintending the building of the De Lamar smelter.

S. E. BRETHERTON, formerly manager of the Silver City smelter, N. M., now of Denver, Colo., has returned from a trip to Mexico, where he has been examining some large mines to decide the best method of treating the ores.

PROF. S. P. LANGLEY, the astronomer and secretary of the Smithsonian Institute of Washington, is in San Francisco to make arrangements by which the Smithsonian will gain complete information from the best available sources concerning the animal and vegetable life, topography and climatic conditions of the Philippines.

## Commercial Paragraphs.

THE Stilwell-Bierce & Smith-Vaile Co. of Dayton, O., has recently received large orders from Canada for the Victor turbines. The orders include two 1000 H. P. Victor high-pressure turbines for driving pulp grinders, one 500 H. P. Victor high-pressure wheel for driving the screens and wet machines, and one 100 H. P. wheel for electric lighting. These wheels are to operate under 240 feet head and are for the Ouitchouan Pulp Co., Ouitchouan, P. Q., Canada.

H. D. CRIPPEN, manufacturer of the Jackson hand-power rock drill, has awarded the \$50 prize, for the best flashlight photograph of the drill in practical operation, to Mrs. Emily Rice of Cheyenne, Wyo. The photograph taken was of a drill operated by J. D. Kazar of Hecla, Wyo., in the Lenox tunnel, who says that "in running 150 feet through granite, one man using the Jackson hand-power drill makes from 18 to 20 inches an hour, while the speed of two men, double-handed, in the ordinary mode of drilling, is from 5 to 6 inches an hour."

THE Allis-Chalmers Co. announces, under date of June 10, 1901, that it has acquired the entire business of the Edward P. Allis Co., Milwaukee, Wis.; Fraser & Chalmers, Chicago, Ill.; Gates Iron Works, Chicago, Ill.; Dickson Mfg. Co. (exclusive of locomotives), Scranton, Pa. The Allis-Chalmers Co. will continue to build, under the same management, the same lines of machinery as heretofore manufactured by the several companies, and hopes to merit a continuance of the generous patronage accorded the several

companies in the past. The general offices are in the Home Ins. Bldg., Chicago, Ill.

THE Ericsson Telephone Co., No. 296 Broadway, New York City, states that the Ericsson telephone was awarded first prize at Paris, 1881; Madrid, 1883; Vienna, 1884; Stockholm, 1886; Copenhagen, 1888; and Chicago, 1893. Also, that their exhibit in Paris in 1900 was from the St. Petersburg, Russia, factory, and was also awarded first prize. This year their exhibit at the Pan-American Exposition at Buffalo, of a 50-subscriber switchboard and some of their several styles of telephones, is in Section S of the Electricity Building, and Mr. W. J. Marland will show friends and patrons their exhibit.

THE Allis-Chalmers Co. has just closed the contract with the United States Mining Co. of Utah for entirely equipping their new 1000-ton copper matting and converting plant to be erected at Murray, near Salt Lake City. This machinery will consist in part of six blast furnaces 42"x180", six converter bowls 84"x126", with two stands and the hydraulic accumulator and pumps for same; the blowing engine for converter, one tandem-compound Reynolds power engine, and three large blowing engines for the blast furnace work. These blowing engines are used in preference to the rotary blowers ordinarily used, the three named having a displacement of 75,000 cubic feet of free air per minute at 2½ pounds pressure. The blowing cylinders are all of the Edwin Reynolds' design and are driven by cross-compound condensing Reynolds' Corliss engines. Added to this order is a 50-drill Reynolds' air compressor, with Corliss compound steam end and compound air end. The Bingham Copper & Gold Mining Co., also located near Murray, recently decided to add a converting plant to their smelting plant, and have placed the order for it with the Allis-Chalmers Co.; this will consist of Corliss blowing engine and the necessary converter bowls and stands.

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JUNE 18, 1901.

676,651.—CURTAIN SUPPORT—J. N. Anderson, Mono Lake, Cal.  
676,834.—REFILLABLE PACKAGE—L. Blatz, La Mirada, Cal.  
676,456.—VOTE RECORDER—A. J. Boling, S. F.  
676,427.—CONCENTRATOR—W. G. Dodd, S. F.  
676,803.—LID FOR COOKING UTENSILS—A. H. Drake, Union, Or.  
676,534.—CONCENTRATOR—T. Dyan, Amador, Cal.  
676,715.—BOTTLE—F. Franz, S. F.  
676,554.—FISHING ROD TIP—W. Friedlander, Portland, Or.  
676,608.—STEAMING FRUIT, ETC.—W. E. Hale, Alameda, Cal.  
676,748.—FURNITURE DRAWER—R. G. Hargrave, Colfax, Wash.  
676,504.—STRAW STACKER—M. B. Kassel, Pomeroy, Wash.  
676,437.—PRINTING PRESS—Knoch & Vogel, Los Angeles, Cal.  
676,542.—PUMP—S. W. Luitweiler, Los Angeles, Cal.  
676,566.—FURNACE—A. Magnuson, Emeryville, Cal.  
676,544.—BEN—F. Martin, S. F.  
676,430.—CUTTING—W. W. Oakes, Seattle, Wash.  
676,704.—PROTECTING PILES—S. L. Shufleton, Seattle, Wash.  
676,518.—OIL BURNER—A. C. Stewart, Santa Paula, Cal.  
676,856.—WHEEL HUB—E. H. Wagener, Modesto, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR STEAMING AND SPICING DRIED FRUIT.—No. 676,608. June 18, 1901. C. E. Hale, Alameda, Cal., assigned to the J. K. Ramsley Co., of Chicago, Ills. This invention relates to an apparatus which is designed for steaming or spicing dried fruits of any description which are capable of such treatment. It comprises a containing chamber for the fruit, a perforated pipe extending into the chamber, a hood within the chamber having its upper portion enclosing the pipe, said hood being perforated to permit the vapor delivered from the pipe to be discharged into the mass of fruit which covers and surrounds the hood. In conjunction with this is a chamber adapted to contain flavoring material, and means for directing the vapor through the flavoring material before it reaches the fruit containing chamber.

HEATING FURNACES.—No. 676,566. June 18, 1901. A. Magnuson, Emeryville, Cal. The object of this invention is to provide a means for preventing the escape of heat through the doors of furnaces which are used for heating purposes and which have a strong blast. It is also designed to prevent a too free escape of heat through the top of the furnace. It consists of an enclosure forming wind boxes extending beyond the front and these boxes are so arranged with relation to the door openings that a blast of air may be directed across said openings so as to cut off and prevent the discharge of hot air outwardly from the furnace. Channels are made through the hearth below the opening so that the blast passes also through these channels.

WHEEL HUB AND BOX THEREFOR.—No. 676,856. June 18, 1901. Mrs. S. J. Willson, Administratrix of E. H. Wagener, Modesto, Cal. This invention relates to improvements in wheel hubs and boxes therefor, and is especially adapted for sulky or gang plows which are mounted upon wheels. It

consists of an independent journal box fitting the hub of the wheel and turnable therein, and means for removably locking the box within the hub. Dust caps or sleeves are fitted to the chambers in the ends of the box, and means for holding the wheel in place so that the dust caps are held stationary while the wheel and journal-box are turnable.

CAN COOLING MACHINE.—No. 676,070. June 11, 1901. Erik Maubla, Astoria, Or. This invention relates to improvements in machines for cooling cans after they have come from the soldering machine. It consists essentially of a revoluble reservoir having an annular cooling platform or table upon which the cans are delivered automatically in upright position, guides by which the cans are moved outwardly on this table in the course of the revolution of the latter, and means for delivering water to and from the reservoir.

## Latest Market Reports.

SAN FRANCISCO, June 27, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c nominal (1000 fine); San Francisco, 59½c; Mexican dollars, nominal San Francisco, 47½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £67 17s 6d per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco \$4.90, carload lots, 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 7s 6d per ton—2.67½ cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton—3.584 cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13½c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.85c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 31c; bar tin, \$3 ½ lb. 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS.—F. o. b. New York 50¢@60¢ per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb. small lots.

BISMUTH.—New York, \$3 ½ lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb. lots.

PLATINUM.—San Francisco, crude, \$22 ½ oz.; New York, \$22 per Troy oz.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

TUNGSTEN.—New York, \$3 ½ lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37½, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50¢@60¢ per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

## SITUATIONS WANTED.

SUPERINTENDENT of gold mine or mill desires position. Thoroughly experienced in mining and milling gold ores. Competent assayer, chemist and surveyor. Technical graduate. Salary moderate till ability is demonstrated. Address B. Sc., care this paper.

A sober, industrious, young man, who is a competent surveyor, assayer, draughtsman and book-keeper desires a situation. Understands the preparation of maps thoroughly. Good references; salary reasonable until abilities are demonstrated; technically trained; three years' practical experience. "M," care of this office.

POSITION in charge of a gold mine or mill desired by a graduate Mining Engineer, who is thoroughly experienced in mining and milling gold ores as practiced in this country and Mexico. Can assay, survey, manage men, etc. Will accept a percentage of profits in a good company for part salary. Address "Engineer," care Mining and Scientific Press.

**PRACTICAL SMELTERMAN,** who had experience with sulphide and carbonate copper and lead ores in California and Mexico, competent to design or take charge of smelter, wants responsible position as chemist, furnace boss or superintendent. Address "Metallurgist," care Mining and Scientific Press.

**A YOUNG MAN,** having taken a course in surveying, including practical field and office work, wishes position as chairman or work in any capacity with a surveyor, civil or mining engineer. Address M. S., Box 10, Standish, Cal.

## NOTICE.

The JAMESTOWN MINING AND MILLING COMPANY beg to announce to the public that they are now open for its inspection. Their property consists of three full mining claims in the very heart of the great gold district of Tuolumne County. Among their property is the well known "BADGER" mine, which is adjacent to the famous "ROYAL," for which an offer of \$1,500,000 was recently refused. The ore of the Badger mine is ribbon quartz having an average of 35 in free gold and carrying about one and one-half per cent of sulphurets assaying from \$30 to \$300 per ton. With improved machinery, the cost of mining and milling will not exceed \$2.25 per ton. Now, in view of the fact that the JAMESTOWN M. & M. Co. realize that, in order to make their mines productive and paying properties, they must equip and prepare the mines for the extraction of ore, they will place 35,000 shares of their treasury stock, which is 100,000 shares, on the market at the very low price of 50 cents per share; which will place the mine on a first-class paying basis, in view of the developments already done on the mine. And they are confident that the last 50,000 shares will have a value of \$2.50 per share. To those contemplating an investment, this is a first-class proposition and one that cannot afford to be overlooked, as it will bear the closest investigation. PROSPECTUS and the fullest information can be had at the Company's office, Room 21, No. 40 Montgomery St., San Francisco.

J. W. BYRD, Secretary.

## WANTED.

WANTED. - PROPERTIES CONTAINING MAGNETIC PYRITES or SULPHURETS by parties who mean business. Address samples and particulars to Dr. Beecher, Oliver Hotel, Corner Mason and Pine Sts., San Francisco, California.

**WANTED.**  
Developed and Partly Developed Gold and Copper Mines.

Full expert reports, maps and 90 days' exclusive options must be furnished. Have CASH CUSTOMERS for worthy properties.

L. W. TULLEYS, COUNCIL BLUFFS, IA.

## WANTED TO BUY.

One 20 H. P. Upright, one 30 H. P. and one 40 H. P. Horizontal, Boilers; also a 30 or 35 H. P. Engine and one 15 H. P. ditto. Belting.

Must be cheap for cash, and in perfect condition. Address immediately, with full particulars,

HILL ATWOOD & CO.,  
Omo Ranch, El Dorado Co., Cal.

## NOTICE.

Notice is hereby given to all parties not to use, manufacture, permit to be used or manufactured, any device employing the process of the ROBINSON ORE CONCENTRATOR or any infringement thereon, except by legal authority.

## "THE DANIEL BEST"

50 Horse Power

## TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, **50 HORSE POWER.**

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,
San Leandro, California.

CALKINS' AUTOMATIC CUPEL MACHINE.

(PATENTED.)

BEGINNING COMPRESSION.

COMPRESSING.

EXPELLING CUPEL.

600 PERFECT CUPELS AN HOUR.

AN ARRANGEMENT of levers multiplies the amount of power, applied to the end of handle, twenty times, and the cupels made by this machine are perfectly homogeneous, giving greater power of absorption. The feed is entirely automatic, making the cupels of a uniform thickness; and they are expelled with a perfect edge. We make a table and a wall machine, employing the same principles but with a hand feed. These appliances are in use in all parts of the world and make perfect cupels.

The Wilfley Concentrating Table

The most satisfactory concentrating table now in use.
It will give better net returns than any other machine.
It will make a satisfactory saving on the finest slimes or will handle pulp as coarse as 8-mesh to equal advantage.
The Wilfley Table is made only under the personal supervision of the inventor. It is built right and all possible improvements are embodied in the later machines.
Send for circulars describing the latest improved table.

THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its
Advantages :

Wearing parts reduced to a minimum. All parts are interchangeable.
Will take ore from finest mesh up to 6-mesh without sizing.
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD.
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

THE COLORADO IRON WORKS CO.,

Established 1860.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SEND FOR CATALOGUE.

THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. **LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING.** A 1-inch stream will furnish ample water for a 50-ton per hour machine.

CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings.

The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from 1 to 200 tons per hour.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

WHAT OTHER PEOPLE SAY.

The International M. & D. Co., Canton, O.

MATAPE, SONORA, MEXICO, April 23, 1901.

GENTLEMEN:—"Our machine is truly a 'Wonder.' It is without a question the greatest machine of the kind I have ever seen in all my 47 years' experience in placer mining. A number of times I have had the machine fed up to 20 tons per hour and have held my hand in the water so that I could feel the gravel as it passed along the bottom and over the rim of the pan, and the bottom of the pan was clear all the time, showing that we might have fed it much faster without fear of choking it. I have panned over a hundred pans from the tailings of our machine, and have not yet found a single color in them. The machine is correct in principle and is absolutely perfect as a gold saver. It saves the finest gold, even four gold."

Respectfully,

T. R. ANDREWS.

ELKHORN, COLO., April 13, 1901.

GENTLEMEN:—"Your 'Wonder' Placer Machine is the greatest gold saver I have ever seen. One boy and myself are washing with the 18-inch, hand power machine, 2 tons of gravel per hour. I will recommend your machines to all miners who want a first-class placer machine."

Respectfully,

A. Y. GORDON.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

THE Prescott AND
Eastern Railroad
ENTERS AN

Extremely Rich Mining Country.

The opening of this road makes easy of access one of the Richest Gold and Copper Mining Districts in the World. Hundreds of prospectors are turning their attention to this section.

Take the Santa Fe System to Ash Fork, thence via the SANTA FE, PRESCOTT & PHOENIX RY. to Prescott. This latter road also reaches Wickenburg, where is located the great Vulture Gold Mine and where the recent marvelous gold strike was made in the Oro Grande.

For further information and descriptive literature, address H. P. ANEWALT, Gen. Frt. & Pass. Agt., PRESCOTT, ARIZ.

The Mining Man, Prospector or Investor

will find something worthy of attention in the
GREAT MERCUR AND TINTIC MINING
DISTRICTS OF UTAH.

Reached via the

Oregon Short Line RAILROAD.

POINTS OF EXCELLENCE

OF OUR NEW

JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue. Send us your inquiries.

THE PNEUMATIC CYANIDE PROCESS CO., 306 Boston Bldg., Denver, Colo.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had previously shown in laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE GOLD AND SILVER EXTRACTION CO. OF AMERICA, LTD.
TESTING WORKS, 1716 BLAKE ST. 208-210 McPHER BLDG., DENVER, COLO.

Prospecting Machinery.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 600 tons having been handled in ten hours time."

4 Cents Per Ton Per Mile

Is what it costs to transport Ore with our systems of Aerial Wire Rope Tramways.

We'd like to send you our book telling you all about it, but we can't do it unless you write us

WHERE YOU'RE AT.

THE J. H. MONTGOMERY MACHINERY CO.,
DENVER, COLO., U. S. A.

Twentieth Century Racine Launches.

FOR BUSINESS OR PLEASURE.

THESE boats are made by one of the oldest, largest and most successful boat-building concerns in the country, and we can demonstrate that we can give the best results for the least money. Fifteen to twenty-five foot launches and all size row boats carried in stock for immediate shipment. Any size gasoline launches up to fifty-foot. Launches as low as \$185.00. If complete boats are not desired, we can furnish machinery equipment. Electro vapor motors for launches combine absolute safety, economy and simplicity; in fact the maximum of power in the minimum of weight and space. An ideal motor designed and built upon scientific principles after actual experience; no expenditure. No government restriction; no licensed engineer or pilot; no smokestack; no fire; no noise from exhaust; no naphtha under pressure; no heat; no disagreeable odor; no boiler, coal, wood or fireman required. The perfection of power for small launches. Every launch is run in the water over a measured course before shipment. Motors 3 to 6 horse power, single cylinder; 8 to 16 horse power, double cylinder; 18 to 24 horse power, triple cylinder. Send 10 cents in stamps for 80-page boat catalog.

ASSESSMENT NOTICES.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of May, 1901, an assessment (No. 34) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of July, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 6th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHARLES S. ANDERSON, Secretary.
Office—Room 31, tenth floor, Mills Building, San Francisco, California.

WILLIETTA MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of June, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 3, 206 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
FRANK E. COEDES, Secretary.
Office—Room 3, 206 Sansome street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of June, 1901, an assessment (No. 23) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALEX. GRANGER, Secretary.
Office—Room 223 Crocker Building, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of June, 1901, an assessment (No. 3) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 301 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 13th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 301 Claus Spreckels Building, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of June, 1901, an assessment (No. 2) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 301, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 301, Claus Spreckels Building, San Francisco, California.

THE UNDERSIGNED, TRUSTEE IN BANKRUPTCY OF WOLF & ZWICKER Iron Works, bankrupt, is about to offer for sale the entire plant of that company, consisting of foundry, machine shop, pipe shop, boiler shop, blacksmith shop, and ship tools.

The plant comprises about three acres of land and the buildings thereon, situated in the city of Portland, Oregon, at the east end of the Madison Street bridge on Hawthorne avenue, East Water street, and having a frontage on the Willamette river.

Parties interested are invited to correspond with the trustee; will furnish full particulars, and inspection is invited.

H. G. PLATT,
Trustee in Bankruptcy, Wolf & Zwickler Iron Works, Bankrupt.

Placer Deposits.

Parties interested in placer deposits that cannot be successfully operated, owing to a lack of water, should communicate with THOMAS A. EDISON, Orange, N. J.

Attention of Mining Men

and others is invited to the
DEAN-OVIATT ORE ROASTER AND DESULPHURIZER.
WELL WORTH YOUR INVESTIGATION!
Interest For Sale.

OFFICE, 331 PHELAN BLDG., SAN FRANCISCO.

DELINQUENT SALE NOTICE.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California; location of works, Contra Costa County, California.

**SOLAR
HOUSE
LIGHTS**

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs **\$4.00** Per Light

EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

LET US ESTIMATE

on plan or equipment for your new grinding plant, or on changes or additions to your present outfit. Our grinding and pulverizing machinery is the Standard of America for reducing or pulverizing ore, cement-rock, and refractory substances generally. We are always ready to prepare estimates, submit plans or demonstrate the superiority of

Smidth Ballmills and Davidsen Patent Tubemills.

By way of introduction let us send Catalogs.

THE DAVIDSEN
PATENT TUBEMILL

COPENHAGEN.

The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. Formerly
a Quarter of a Century Putman Boots have been the standard among
Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who
demand the very best) and we have learned through our personal contact
with them how to make a perfect boot. Putman Boots are water proof.
Send for catalogue of over 20 different styles of boots. Also Indian Tan-
ned Moose Hide Moccasins.

This cut shows our No. 672 Three Quarter Boot. (14 inches high) Bellows Tongue.
Made on any style too desired. Uppers are Special Chrome Tanned Calf Skin, tanned
with the grain of the hide left on (our special tannage) making the leather **Water
Proof.** Large eyelets and wide leather laces, also laced at side to fit the boot tight
around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or
Heavy. The sole is genuine Hand Sewed making it soft and
easy, and made of the best Water Proofed Oak Sole Leather.
Made to your measure and delivered to any part of
the U. S. for..... **\$7.50**
Send for order blank showing how to measure your foot.

H. J. PUTMAN & CO.
23 BRIDGE SQUARE. MINNEAPOLIS, MINN.

SMOOTH-ON Iron Cement No. 2

Unequaled for stopping leaks and pitting in MARINE BOILERS, being
applied to the inside seams and rivet heads with a trowel or brush. Send
for descriptive catalogue and testimonials. Sole proprietors and manufac-
turers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MESSRS. MADISON, BRUCE & SELLERS,

24-26 STEUART ST., SAN FRANCISCO, CAL.....AGENTS FOR THE PACIFIC COAST.

Important to Gold Miners
And Manufacturers of Mining Machinery.

Silver Plated Copper Mining Plates,
For Saving Gold in Quartz, Placer and Beach Mining.

The Most Extensive and Successful Manufacturers on the Pacific
Coast. Get our reduced rates. Send for circulars. Old plates replated
also bought.

FOR TOOLS, MINING DRILLS, ETC.

I. WILLARD BEAM, Agent,
29 MAIN STREET,
SAN FRANCISCO, CAL.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

FOR DESCRIPTIVE PAMPHLETS, ADDRESS

Mill Practice	5
Mine Report for 1900	5
Mines	9, 41, 53, 65, 76, 86, 97, 105, 107, 117, 127, 137, 151, 161, 172, 182, 193, 204, 214, 224, 234, 244, 254, 264, 275, 286, 298
Mining Legislation	80, 81, 155, 161
Mining State	219
Petroleum District in	296
Shut-Covering	292
State Mining Bureau	119, 122
* Tunnel Work	110, 114
Columbia University School of Mines	91
Combination of British Columbia Smelters	91
Combustion of Anthracite Coal	102

	PAGE.
Commendatory Comment	84
Comminuted Ton, Cost of Milling	281
Alliance Against United States	278
Horse Power	122
Commutator Brushes	155
Comparison of Prime Movers for Electrical Generators	219
Composition for Lining Crucibles	59
Compressed Air Pressures in Mine Work	281
Diagram for Calculating Pressure	390
For Felling Timber	390
Machinery Co.	163
Pumping	249
Tools, Cost of Work	270
Compressor and Blower	177
Comstock Tunnel Co.	70
Condensate Settling from Vanner	259
"Concentrates"	Every Issue
* Concentrating Apparatus	135, 158
Tests and Calculations	114
Without Sizing	6
Concentration of Cinnabar	102
Of Ore by Oil	144
* Concentration	74, 126
Concrete Properly Proportioned	132
Composition of	239
Reinforced	239
Condensing Engine, Feed Water	166
Conductivity of Heat	60
Conglomerate, Auriferous	259
Conglomerates, Formation of	130, 136
* Congress Mine, Arizona	130, 136
Consolidated Cariboo M. Co.	292
Constant Magnitude	88
Constitution Requirement of Compensation, Decision	270
Construction of Dams	192
Consumption of Cyanide	146
Contact Codes	329
Deposits, Character of	391
Conventions, Places for Holding	96
* Converter Slag	85, 96, 116, 159
* Conveyor	154
* Co-operative Mining	99
Copper, A. S.	81
Copper in Ammonia Solution	81
And Zinc Extraction	229
Consumption in Germany	145
Converters	145
Extraction in Arizona	134, 166
Extraction Process	7, 134, 168
For Boiler Tubes	3
Containing	145
In Alaska	253
Indications	66, 73
* In Esmeralda Co., Nevada	147
In Ore, Test for	239
Island	131
Ore Leaching with Sulphurous Acid	131
Ores, Leaching	6, 51, 61, 83, 123, 131
Output of Montana, 1900	81
Pipe, How Bent	81
Plate Gold Absorption	102
Plates, How Cleaned Up	145
Production, Cost of	232
Production in Japan	249
Production of Chile	166
Production, United States, 1900	35, 132
Production, World	199, 292
Prospects	70
Pyrites	112
Volumetric Determination of	249
Welding	249
* Copper Queen Mine, Arizona	130
Coram, J. A.	109
* Cord " of Ore	166
Corea for Mining	249
Cornish and Direct-Acting Duplex Pumps	71
Corporation Law	47, 102, 177
Corrosion of Wire Ropes	125
Cory, C. L.	163
Cost of Crushing Ore	70
Of Carrying Material	132
Of Copper Production	132
Of Diamond Drill Plant	59
Of Diamond Drill Work	166, 237, 252, 281
Of Electrical Horse Power	35
Of Gold Mining and Milling	199
Of Horse Power per Hour	64
Of Mining	6, 81
Of Ore Treatment	109
Of Ore Treatment at Republic, Wash.	155
Of Producing Ounce of Gold or Silver	81
Of Teaming Freight	92
Of Wagon Compressor Air Tools	270
Sheet of Gwin Mine, Cal.	162
Counties, Large	66
Copper-Coles Process Welding Aluminum	270
Crippen, H. D.	55
Cripple Creek Gold Production	209
* Crosshead for Mine Shafts	116
* Crucible	145
For Melting	81
For Melting	145
* Furnace	126
Lining	39, 50
* Or Retort	63
* Protector	65
* Crushing	47
Crushing, Power for Stamp Mills	47
By Rolls	250
* Roll	85, 106
Rolls for Fine Product	102
Wet or Dry	177
Crystallization of Gold	188
Of Steel	242
Cuba, Mining in	10, 285
Cyanide Action on Ore	112
And Liquefied Air	155
Consumption	132, 146
Consumption of Zinc	112
Duty on	59, 112
Method at Mt. Morgan, Queensland	71
Poisoning, Antidote for	177
Price	124
Process, Electrolytic Recovery of Metal	283
Process in Mercur, Utah	121, 122
Process in Revolving Barrels	35
Process of W. P. Miller	124
Processes	177
Recovery	165, 166
Solution Containing Copper	70
Solution, Gold Precipitation Therefrom	71, 132
Solution, How Reduced	92
Solution, Loss of	188, 212
Solution Velocity	145
Tank Method	47
Treatment, When First Mentioned	47
Use of	82
Cyandling Complex Gold Ores	272
In Black Hills, S. D.	251
In Mexico	93
* Pneumatic Processes for	200, 219
Rock in Place	71
Cylinder Clearance in Air Compressors	259
Lubrication of Gas Engine	47
D	
Dam Construction by Hydraulicicking	257, 281
Construction	122
Dawson, Mint at	187
Deadwood-Tierra Mine, S. D.	154
* D. & D. Smelter, Deadwood, S. D.	153
Decision in Oil Land Cases	208
